determinemos primero la esperanza de $L(\tau)$:

$$\begin{aligned}
\mathbb{E}[L(\tau)] &= \sum_{k=0}^\infty k\mathbb{P}\{L(\tau)=k\}=\sum_{k=0}^\infty k\left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)^k\\
&= \left(\frac{\mu}{\lambda+\mu}\right)\sum_{k=0}^\infty k\left(\frac{\lambda}{\lambda+\mu}\right)^k=\left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)\sum_{k=1}^\infty k\left(\frac{\lambda}{\lambda+\mu}\right)^{k-1}\\
&= \frac{\mu\lambda}{(\lambda+\mu)^2}\left(\frac{1}{1-\frac{\lambda}{\lambda+\mu}}\right)^2=\frac{\mu\lambda}{(\lambda+\mu)^2}\left(\frac{\lambda+\mu}{\mu}\right)^2\\
&= \frac{\lambda}{\mu}.
\end{aligned}$$

Ahora su segundo momento:

$$\begin{aligned}
\mathbb{E}\left[(L(\tau))^2\right] &= \sum_{k=0}^{\infty} k^2 \mathbb{P}\{L(\tau)=k\} = \sum_{k=0}^{\infty} k^2 \left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)^k \\
&= \left(\frac{\mu}{\lambda+\mu}\right)\sum_{k=0}^{\infty} k^2 \left(\frac{\lambda}{\lambda+\mu}\right)^k = \frac{\mu\lambda}{(\lambda+\mu)^2}\sum_{k=2}^{\infty}(k-1)^2\left(\frac{\lambda}{\lambda+\mu}\right)^{k-2} \\
&= \frac{\mu\lambda}{(\lambda+\mu)^2}\left(\frac{\frac{\lambda}{\lambda+\mu}+1}{\left(\frac{\lambda}{\lambda+\mu}-1\right)^3}\right) = \frac{\mu\lambda}{(\lambda+\mu)^2}\left(-\frac{\frac{2\lambda+\mu}{\lambda+\mu}}{\left(-\frac{\mu}{\lambda+\mu}\right)^3}\right) \\
&= \frac{\mu\lambda}{(\lambda+\mu)^2}\left(\frac{2\lambda+\mu}{\lambda+\mu}\right)\left(\frac{\lambda+\mu}{\mu}\right)^3 = \frac{\lambda(2\lambda+\mu)}{\mu^2} \\
&= \frac{\lambda}{\mu}\left(2\frac{\lambda}{\mu}+1\right).
\end{aligned}$$

y por tanto

$$\begin{aligned}
V[L(\tau)] &= \frac{\lambda(2\lambda+\mu)}{\mu^2} - \left(\frac{\lambda}{\mu}\right)^2 = \frac{\lambda^2+\mu\lambda}{\mu^2} \\
&= \frac{\lambda}{\mu}\left(\frac{\lambda}{\mu}+1\right).
\end{aligned}$$

Ahora, determinemos la distribución del número de usuarios que pasan de $\hat{Q}_2$ a Q_2 considerando dos políticas de traslado en específico:

1. Solamente pasa un usuario,
2. Se permite el paso de k usuarios,

una vez que son atendidos por el servidor en $\hat{Q}_2$.

Política de un solo usuario: Sea R_2 el número de usuarios que llegan a $\hat{Q}_2$ al tiempo t, sea R_1 el número de usuarios que pasan de $\hat{Q}_2$ a Q_2 al tiempo t.

A saber:

$$\begin{aligned}
\mathbb{E}[R_1] &= \sum_{y\geq 0}\mathbb{P}[R_2=y]\,\mathbb{E}[R_1|R_2=y] \\
&= \sum_{y\geq 0}\mathbb{P}[R_2=y]\sum_{x\geq 0} x\mathbb{P}[R_1=x|R_2=y] \\
&= \sum_{y\geq 0}\sum_{x\geq 0} x\mathbb{P}[R_1=x|R_2=y]\,\mathbb{P}[R_2=y].
\end{aligned}$$

Determinemos

$$\mathbb{E}[R_1|R_2=y] = \sum_{x\geq 0} x\mathbb{P}[R_1=x|R_2=y]. \tag{36.43.8}$$

supongamos que $y=0$, entonces

$$\begin{aligned}
\mathbb{P}[R_1=0|R_2=0] &= 1, \\
\mathbb{P}[R_1=x|R_2=0] &= 0, \text{ para cualquier } x\geq 1,
\end{aligned}$$

por tanto

$$\mathbb{E}[R_1|R_2=0]=0.$$

Para $y=1$,

$$\begin{aligned}
\mathbb{P}[R_1=0|R_2=1] &= 0, \\
\mathbb{P}[R_1=1|R_2=1] &= 1,
\end{aligned}$$

entonces

$$\mathbb{E}[R_1|R_2=1]=1.$$

Para $y > 1$:

$$\begin{aligned}\mathbb{P}\left[R_1 = 0 | R_2 \geq 1\right] &= 0,\\ \mathbb{P}\left[R_1 = 1 | R_2 \geq 1\right] &= 1,\\ \mathbb{P}\left[R_1 > 1 | R_2 \geq 1\right] &= 0,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1 | R_2 = y\right] = 1, \text{ para cualquier } y > 1.$$

es decir

$$\mathbb{E}\left[R_1 | R_2 = y\right] = 1, \text{ para cualquier } y \geq 1.$$

Entonces

$$\begin{aligned}\mathbb{E}\left[R_1\right] &= \sum_{y\geq 0}\sum_{x\geq 0} x\mathbb{P}\left[R_1 = x | R_2 = y\right]\mathbb{P}\left[R_2 = y\right] = \sum_{y\geq 0}\sum_{x} \mathbb{E}\left[R_1 | R_2 = y\right]\mathbb{P}\left[R_2 = y\right]\\ &= \sum_{y\geq 0}\mathbb{P}\left[R_2 = y\right] = \sum_{y\geq 1}\frac{(\lambda t)^k}{k!}e^{-\lambda t} = 1.\end{aligned}$$

Además para $k \in Z^+$

$$\begin{aligned}f_{R_1}(k) &= \mathbb{P}\left[R_1 = k\right] = \sum_{n=0}^{\infty}\mathbb{P}\left[R_1 = k | R_2 = n\right]\mathbb{P}\left[R_2 = n\right]\\ &= \mathbb{P}\left[R_1 = k | R_2 = 0\right]\mathbb{P}\left[R_2 = 0\right] + \mathbb{P}\left[R_1 = k | R_2 = 1\right]\mathbb{P}\left[R_2 = 1\right]\\ &+ \mathbb{P}\left[R_1 = k | R_2 > 1\right]\mathbb{P}\left[R_2 > 1\right],\end{aligned}$$

donde para

$k = 0$**:**

$$\begin{aligned}\mathbb{P}\left[R_1 = 0\right] = \mathbb{P}\left[R_1 = 0 | R_2 = 0\right]\mathbb{P}\left[R_2 = 0\right] + \mathbb{P}\left[R_1 = 0 | R_2 = 1\right]\mathbb{P}\left[R_2 = 1\right]\\ + \mathbb{P}\left[R_1 = 0 | R_2 > 1\right]\mathbb{P}\left[R_2 > 1\right] = \mathbb{P}\left[R_2 = 0\right].\end{aligned}$$

$k = 1$**:**

$$\begin{aligned}\mathbb{P}\left[R_1 = 1\right] = \mathbb{P}\left[R_1 = 1 | R_2 = 0\right]\mathbb{P}\left[R_2 = 0\right] + \mathbb{P}\left[R_1 = 1 | R_2 = 1\right]\mathbb{P}\left[R_2 = 1\right]\\ + \mathbb{P}\left[R_1 = 1 | R_2 > 1\right]\mathbb{P}\left[R_2 > 1\right] = \sum_{n=1}^{\infty}\mathbb{P}\left[R_2 = n\right].\end{aligned}$$

$k = 2$**:**

$$\begin{aligned}\mathbb{P}\left[R_1 = 2\right] = \mathbb{P}\left[R_1 = 2 | R_2 = 0\right]\mathbb{P}\left[R_2 = 0\right] + \mathbb{P}\left[R_1 = 2 | R_2 = 1\right]\mathbb{P}\left[R_2 = 1\right]\\ + \mathbb{P}\left[R_1 = 2 | R_2 > 1\right]\mathbb{P}\left[R_2 > 1\right] = 0.\end{aligned}$$

$k = j$**:**

$$\begin{aligned}\mathbb{P}\left[R_1 = j\right] = \mathbb{P}\left[R_1 = j | R_2 = 0\right]\mathbb{P}\left[R_2 = 0\right] + \mathbb{P}\left[R_1 = j | R_2 = 1\right]\mathbb{P}\left[R_2 = 1\right]\\ + \mathbb{P}\left[R_1 = j | R_2 > 1\right]\mathbb{P}\left[R_2 > 1\right] = 0.\end{aligned}$$

Por lo tanto

$$\begin{aligned}f_{R_1}(0) &= \mathbb{P}\left[R_2 = 0\right]\\ f_{R_1}(1) &= \sum_{n\geq 1}^{\infty}\mathbb{P}\left[R_2 = n\right]\\ f_{R_1}(j) &= 0, \text{ para } j > 1.\end{aligned}$$

Política de k usuarios: Al igual que antes, para $y \in Z^+$ fijo

$$\mathbb{E}\left[R_1 | R_2 = y\right] = \sum_{x} x\mathbb{P}\left[R_1 = x | R_2 = y\right].$$

Entonces, si tomamos diversos valore para y:

$y = 0$:

$$\begin{aligned}\mathbb{P}\left[R_1 = 0 | R_2 = 0\right] &= 1,\\ \mathbb{P}\left[R_1 = x | R_2 = 0\right] &= 0, \text{ para cualquier } x \geq 1,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=0\right]=0.$$

Para $y=1$,

$$\begin{aligned}\mathbb{P}\left[R_1=0|R_2=1\right] &= 0,\\ \mathbb{P}\left[R_1=1|R_2=1\right] &= 1,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=1\right]=1.$$

Para $y=2$,

$$\begin{aligned}\mathbb{P}\left[R_1=0|R_2=2\right] &= 0,\\ \mathbb{P}\left[R_1=1|R_2=2\right] &= 1,\\ \mathbb{P}\left[R_1=2|R_2=2\right] &= 1,\\ \mathbb{P}\left[R_1=3|R_2=2\right] &= 0,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=2\right]=3.$$

Para $y=3$,

$$\begin{aligned}\mathbb{P}\left[R_1=0|R_2=3\right] &= 0,\\ \mathbb{P}\left[R_1=1|R_2=3\right] &= 1,\\ \mathbb{P}\left[R_1=2|R_2=3\right] &= 1,\\ \mathbb{P}\left[R_1=3|R_2=3\right] &= 1,\\ \mathbb{P}\left[R_1=4|R_2=3\right] &= 0,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=3\right]=6.$$

En general, para $k\geq 0$,

$$\begin{aligned}\mathbb{P}\left[R_1=0|R_2=k\right] &= 0,\\ \mathbb{P}\left[R_1=j|R_2=k\right] &= 1,\ \text{para } 1\leq j\leq k,\\ \mathbb{P}\left[R_1=j|R_2=k\right] &= 0,\ \text{para } j>k,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=k\right]=\frac{k\left(k+1\right)}{2}.$$

Por lo tanto

$$\begin{aligned}\mathbb{E}\left[R_1\right] &= \sum_{y}\mathbb{E}\left[R_1|R_2=y\right]\mathbb{P}\left[R_2=y\right]\\ &= \sum_{y}\mathbb{P}\left[R_2=y\right]\frac{y\left(y+1\right)}{2}=\sum_{y\geq 1}\left(\frac{y\left(y+1\right)}{2}\right)\frac{\left(\lambda t\right)^{y}}{y!}e^{-\lambda t}\\ &= \frac{\lambda t}{2}e^{-\lambda t}\sum_{y\geq 1}\left(y+1\right)\frac{\left(\lambda t\right)^{y-1}}{\left(y-1\right)!}=\frac{\lambda t}{2}e^{-\lambda t}\left(e^{\lambda t}\left(\lambda t+2\right)\right)\\ &= \frac{\lambda t\left(\lambda t+2\right)}{2},\end{aligned}$$

es decir,

$$\mathbb{E}\left[R_1\right]=\frac{\lambda t\left(\lambda t+2\right)}{2}. \tag{36.43.9}$$

Además para $k\in Z^{+}$ fijo

$$\begin{aligned}f_{R_1}\left(k\right) &= \mathbb{P}\left[R_1=k\right]=\sum_{n=0}^{\infty}\mathbb{P}\left[R_1=k|R_2=n\right]\mathbb{P}\left[R_2=n\right]\\ &= \mathbb{P}\left[R_1=k|R_2=0\right]\mathbb{P}\left[R_2=0\right]+\mathbb{P}\left[R_1=k|R_2=1\right]\mathbb{P}\left[R_2=1\right]\\ &+ \mathbb{P}\left[R_1=k|R_2=2\right]\mathbb{P}\left[R_2=2\right]+\cdots+\mathbb{P}\left[R_1=k|R_2=j\right]\mathbb{P}\left[R_2=j\right]+\cdots+\end{aligned}$$

donde para

$k = 0$:

$$\begin{aligned}\mathbb{P}[R_1 = 0] = \mathbb{P}[R_1 = 0|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = 0|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = 0|R_2 = j]\,\mathbb{P}[R_2 = j] = \mathbb{P}[R_2 = 0].\end{aligned}$$

$k = 1$:

$$\begin{aligned}\mathbb{P}[R_1 = 1] = \mathbb{P}[R_1 = 1|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = 1|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = 1|R_2 = 1]\,\mathbb{P}[R_2 = 1] + \cdots + \mathbb{P}[R_1 = 1|R_2 = j]\,\mathbb{P}[R_2 = j] \\ = \sum_{n=1}^{\infty} \mathbb{P}[R_2 = n].\end{aligned}$$

$k = 2$:

$$\begin{aligned}\mathbb{P}[R_1 = 2] = \mathbb{P}[R_1 = 2|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = 2|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = 2|R_2 = 2]\,\mathbb{P}[R_2 = 2] + \cdots + \mathbb{P}[R_1 = 2|R_2 = j]\,\mathbb{P}[R_2 = j] \\ = \sum_{n=2}^{\infty} \mathbb{P}[R_2 = n].\end{aligned}$$

En general

$$\begin{aligned}\mathbb{P}[R_1 = k] = \mathbb{P}[R_1 = k|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = k|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = k|R_2 = 2]\,\mathbb{P}[R_2 = 2] + \cdots + \mathbb{P}[R_1 = k|R_2 = k]\,\mathbb{P}[R_2 = k] \\ = \sum_{n=k}^{\infty} \mathbb{P}[R_2 = n].\end{aligned}$$

Por lo tanto

$$f_{R_1}(k) \quad = \quad \mathbb{P}[R_1 = k] = \sum_{n=k}^{\infty} \mathbb{P}[R_2 = n].$$

Objetivos Principales

- Encontrar las ecuaciones que modelan el comportamiento de una Red de Sistemas de Visitas Cíclicas (RSVC) con propiedades similares.
- Encontrar expresiones analíticas para las longitudes de las colas al momento en que el servidor llega a una de ellas para comenzar a dar servicio, así como de sus segundos momentos.
- Determinar las principales medidas de Desempeño para la RSVC tales como: Número de usuarios presentes en cada una de las colas del sistema cuando uno de los servidores está presente atendiendo, Tiempos que transcurre entre las visitas del servidor a la misma cola.

36.44. Descripción de una Red de Sistemas de Visitas Cíclicas

Consideremos una red de sistema de visitas cíclicas conformada por dos sistemas de visitas cíclicas, cada una con dos colas independientes, donde además se permite el intercambio de usuarios entre los dos sistemas en la segunda cola de cada uno de ellos.

Supuestos sobe la Red de Sistemas de Visitas Cíclicas

- Los arribos de los usuarios ocurren conforme a un proceso Poisson con tasa de llegada μ_1 y μ_2 para el sistema 1, mientras que para el sistema 2, lo hacen conforme a un proceso Poisson con tasa $\hat{\mu}_1, \hat{\mu}_2$ respectivamente.
- Se considerarán intervalos de tiempo de la forma $[t, t+1]$. Los usuarios arriban por paquetes de manera independiente del resto de las colas. Se define el grupo de usuarios que llegan a cada una de las colas del sistema 1, caracterizadas por Q_1 y Q_2 respectivamente, en el intervalo de tiempo $[t, t+1]$ por $X_1(t), X_2(t)$.
- Se definen los procesos $\hat{X}_1(t), \hat{X}_2(t)$ para las colas del sistema 2, denotadas por $\hat{Q}_1$ y $\hat{Q}_2$ respectivamente. Donde además se supone que $\mu_i < 1$ y $\hat{\mu} < 1$ para $i = 1, 2$.

- Se define el proceso $Y_2(t)$ para el número de usuarios que se trasladan del sistema 2 al sistema 1, de la cola $\hat{Q}_2$ a la cola Q_2, en el intervalo de tiempo $[t, t+1]$. El traslado de un sistema a otro ocurre de manera que los tiempos entre llegadas de los usuarios a la cola dos del sistema 1 provenientes del sistema 2, se distribuye de manera general con parámetro $\tilde{\mu}_2$, con $\tilde{\mu}_2 < 1$.
- En lo que respecta al servidor, en términos de los tiempos de visita a cada una de las colas, se definen las variables aleatorias τ_i, para Q_i, para $i = 1, 2$, respectivamente; y ζ_i para $\hat{Q}_i$, $i = 1, 2$, del sistema 2 respectivamente. A los tiempos en que el servidor termina de atender en las colas $Q_i, \hat{Q}_i$,se les denotará por $\overline{\tau}_i, \overline{\zeta}_i$ para $i = 1, 2$, respectivamente.
- Los tiempos de traslado del servidor desde el momento en que termina de atender a una cola y llega a la siguiente para comenzar a dar servicio están dados por $\tau_{i+1} - \overline{\tau}_i$ y $\zeta_{i+1} - \overline{\zeta}_i$, $i = 1, 2$, para el sistema 1 y el sistema 2, respectivamente.

El uso de la Función Generadora de Probabilidades (FGP's) nos permite determinar las Funciones de Distribución de Probabilidades Conjunta de manera indirecta sin necesidad de hacer uso de las propiedades de las distribuciones de probabilidad de cada uno de los procesos que intervienen en la Red de Sistemas de Visitas Cíclicas.

Cada uno de estos procesos con su respectiva FGP. Además, para cada una de las colas en cada sistema, el número de usuarios al tiempo en que llega el servidor a dar servicio está dado por el número de usuarios presentes en la cola al tiempo t, más el número de usuarios que llegan a la cola en el intervalo de tiempo $[\tau_i, \overline{\tau}_i]$.

Una vez definidas las Funciones Generadoras de Probabilidades Conjuntas se construyen las ecuaciones recursivas que permiten obtener la información sobre la longitud de cada una de las colas, al momento en que uno de los servidores llega a una de las colas para dar servicio, basándose en la información que se tiene sobre su llegada a la cola inmediata anterior.

36.44.1. Funciones Generadoras de Probabilidades

Para cada uno de los procesos de llegada a las colas $X_i, \hat{X}_i$, $i = 1, 2$, y Y_2, con $\tilde{X}_2 = X_2 + Y_2$ anteriores se define su Función Generadora de Probabilidades (FGP): $P_i(z_i) = \mathbb{E}\left[z_i^{X_i(t)}\right], \hat{P}_i(w_i) = \mathbb{E}\left[w_i^{\hat{X}_i(t)}\right]$, para $i = 1, 2$, y $\check{P}_2(z_2) = \mathbb{E}\left[z_2^{Y_2(t)}\right], \tilde{P}_2(z_2) = \mathbb{E}\left[z_2^{\tilde{X}_2(t)}\right]$, con primer momento definidos por $\mu_i = \mathbb{E}[X_i(t)] = P_i^{(1)}(1), \hat{\mu}_i = \mathbb{E}\left[\hat{X}_i(t)\right] = \hat{P}_i^{(1)}(1)$, para $i = 1, 2$, y $\check{\mu}_2 = \mathbb{E}[Y_2(t)] = \check{P}_2^{(1)}(1), \tilde{\mu}_2 = \mathbb{E}\left[\tilde{X}_2(t)\right] = \tilde{P}_2^{(1)}(1)$.

En lo que respecta al servidor, en términos de los tiempos de visita a cada una de las colas, se denotarán por $B_i(t)$ a los procesos correspondientes a las variables aleatorias τ_i para Q_i, respectivamente; y $\hat{B}_i(t)$ con parámetros ζ_i para $\hat{Q}_i$, del sistema 2 respectivamente. Y a los tiempos en que el servidor termina de atender en las colas $Q_i, \hat{Q}_i$, se les denotará por $\overline{\tau}_i, \overline{\zeta}_i$ respectivamente. Entonces, los tiempos de servicio están dados por las diferencias $\overline{\tau}_i - \tau_i$ para Q_i, y $\overline{\zeta}_i - \zeta_i$ para $\hat{Q}_i$ respectivamente, para $i = 1, 2$.

Sus procesos se definen por: $S_i(z_i) = \mathbb{E}\left[z_i^{\overline{\tau}_i - \tau_i}\right]$ y $\hat{S}_i(w_i) = \mathbb{E}\left[w_i^{\overline{\zeta}_i - \zeta_i}\right]$, con primer momento dado por: $s_i = \mathbb{E}[\overline{\tau}_i - \tau_i]$ y $\hat{s}_i = \mathbb{E}\left[\overline{\zeta}_i - \zeta_i\right]$, para $i = 1, 2$. Análogamente los tiempos de traslado del servidor desde el momento en que termina de atender a una cola y llega a la siguiente para comenzar a dar servicio están dados por $\tau_{i+1} - \overline{\tau}_i$ y $\zeta_{i+1} - \overline{\zeta}_i$ para el sistema 1 y el sistema 2, respectivamente, con $i = 1, 2$.

La FGP para estos tiempos de traslado están dados por $R_i(z_i) = \mathbb{E}\left[z_1^{\tau_{i+1} - \overline{\tau}_i}\right]$ y $\hat{R}_i(w_i) = \mathbb{E}\left[w_i^{\zeta_{i+1} - \overline{\zeta}_i}\right]$ y al igual que como se hizo con anterioridad, se tienen los primeros momentos de estos procesos de traslado del servidor entre las colas de cada uno de los sistemas que conforman la red de sistemas de visitas cíclicas: $r_i = R_i^{(1)}(1) = \mathbb{E}[\tau_{i+1} - \overline{\tau}_i]$ y $\hat{r}_i = \hat{R}_i^{(1)}(1) = \mathbb{E}\left[\zeta_{i+1} - \overline{\zeta}_i\right]$ para $i = 1, 2$.

Se definen los procesos de conteo para el número de usuarios en cada una de las colas al tiempo t, $L_i(t)$, para $H_i(t)$ del sistema 1, mientras que para el segundo sistema, se tienen los procesos $\hat{L}_i(t)$ para $\hat{H}_i(t)$, es decir, $H_i(t) = \mathbb{E}\left[z_i^{L_i(t)}\right]$ y $\hat{H}_i(t) = \mathbb{E}\left[w_i^{\hat{L}_i(t)}\right]$. Con lo dichohasta ahora, se tiene que el número de usuarios presentes en los tiempos $\overline{\tau}_1, \overline{\tau}_2, \overline{\zeta}_1, \overline{\zeta}_2$, es cero, es decir, $L_i(\overline{\tau_i}) = 0$, y $\hat{L}_i\left(\overline{\zeta_i}\right) = 0$ para i=1,2 para cada uno de los dos sistemas.

Para cada una de las colas en cada sistema, el número de usuarios al tiempo en que llega el servidor a dar servicio está dado por el número de usuarios presentes en la cola al tiempo $t = \tau_i, \zeta_i$, más el número de usuarios que llegan a la cola en el intervalo de tiempo $[\tau_i, \overline{\tau}_i], \left[\zeta_i, \overline{\zeta}_i\right]$, es decir $\hat{L}_i(\overline{\tau}_j) = \hat{L}_i(\tau_j) + \hat{X}_i(\overline{\tau}_j - \tau_j)$, para $i, j = 1, 2$, mientras que para el primer sistema: $L_1(\overline{\tau}_j) = L_1(\tau_j) + X_1(\overline{\tau}_j - \tau_j)$. En el caso específico de Q_2, además, hay que considerar el número de usuarios que pasan del sistema 2 al sistema 1, a traves de $\hat{Q}_2$ mientras el servidor en Q_2 está ausente, es decir:

$$L_2(\overline{\tau}_1) = L_2(\tau_1) + X_2(\overline{\tau}_1 - \tau_1) + Y_2(\overline{\tau}_1 - \tau_1). \tag{36.44.1}$$

36.44.2. El problema de la ruina del jugador

Supongamos que se tiene un jugador que cuenta con un capital inicial de $\tilde{L}_0 \geq 0$ unidades, esta persona realiza una serie de dos juegos simultáneos e independientes de manera sucesiva, dichos eventos son independientes e idénticos entre sí para cada realización. La ganancia en el n-ésimo juego es $\tilde{X}_n = X_n + Y_n$ unidades de las cuales se resta una cuota de 1 unidad por cada juego simultáneo, es decir, se restan dos unidades por cada juego realizado. En términos de la teoría de colas puede pensarse como el número de usuarios que llegan a una cola vía dos procesos de arribo distintos e independientes entre sí. Su Función Generadora de Probabilidades (FGP) está dada por $F(z) = \mathbb{E}\left[z^{\tilde{L}_0}\right]$, además

$$\tilde{P}(z) = \mathbb{E}\left[z^{\tilde{X}_n}\right] = \mathbb{E}\left[z^{X_n+Y_n}\right] = \mathbb{E}\left[z^{X_n} z^{Y_n}\right] = \mathbb{E}\left[z^{X_n}\right]\mathbb{E}\left[z^{Y_n}\right] = P(z)\,\check{P}(z),$$

con $\tilde{\mu} = \mathbb{E}\left[\tilde{X}_n\right] = \tilde{P}[z] < 1$. Sea $\tilde{L}_n$ el capital remanente después del n-ésimo juego. Entonces

$$\tilde{L}_n = \tilde{L}_0 + \tilde{X}_1 + \tilde{X}_2 + \cdots + \tilde{X}_n - 2n.$$

La ruina del jugador ocurre después del n-ésimo juego, es decir, la cola se vacía después del n-ésimo juego, entonces sea T definida como $T = min\left\{\tilde{L}_n = 0\right\}$. Si $\tilde{L}_0 = 0$, entonces claramente $T = 0$. En este sentido T puede interpretarse como la longitud del periodo de tiempo que el servidor ocupa para dar servicio en la cola, comenzando con $\tilde{L}_0$ grupos de usuarios presentes en la cola, quienes arribaron conforme a un proceso dado por $\tilde{P}(z)$.

Sea $g_{n,k}$ la probabilidad del evento de que el jugador no caiga en ruina antes del n-ésimo juego, y que además tenga un capital de k unidades antes del n-ésimo juego, es decir,
Dada $n \in \{1, 2, \ldots,\}$ y $k \in \{0, 1, 2, \ldots,\}$

$$g_{n,k} := P\left\{\tilde{L}_j > 0, j = 1, \ldots, n, \tilde{L}_n = k\right\}$$

la cual además se puede escribir como:

$$\begin{aligned}
g_{n,k} &= P\left\{\tilde{L}_j > 0, j = 1, \ldots, n, \tilde{L}_n = k\right\} = \sum_{j=1}^{k+1} g_{n-1,j} P\left\{\tilde{X}_n = k - j + 1\right\} \\
&= \sum_{j=1}^{k+1} g_{n-1,j} P\{X_n + Y_n = k - j + 1\} = \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j} P\{X_n + Y_n = k - j + 1, Y_n = l\} \\
&= \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j} P\{X_n + Y_n = k - j + 1 | Y_n = l\} P\{Y_n = l\} \\
&= \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j} P\{X_n = k - j - l + 1\} P\{Y_n = l\}
\end{aligned}$$

es decir

$$g_{n,k} = \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j} P\{X_n = k - j - l + 1\} P\{Y_n = l\} \tag{36.44.2}$$

además

$$g_{0,k} = P\left\{\tilde{L}_0 = k\right\}. \tag{36.44.3}$$

Se definen las siguientes FGP:

$$G_n(z) = \sum_{k=0}^{\infty} g_{n,k} z^k, \text{ para } n = 0, 1, \ldots, \tag{36.44.4}$$

$$G(z, w) = \sum_{n=0}^{\infty} G_n(z) w^n. \tag{36.44.5}$$

En particular para $k = 0$,

$$g_{n,0} = G_n(0) = P\left\{\tilde{L}_j > 0, \text{ para } j < n, \text{ y } \tilde{L}_n = 0\right\} = P\{T = n\},$$

además

$$G(0, w) = \sum_{n=0}^{\infty} G_n(0) w^n = \sum_{n=0}^{\infty} P\{T = n\} w^n = \mathbb{E}\left[w^T\right]$$

la cuál resulta ser la FGP del tiempo de ruina T.

Proposición 36.44.1 *Sean $G_n(z)$ y $G(z,w)$ definidas como en (36.81.4) y (36.81.5) respectivamente, entonces*

$$G_n(z) = \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z). \tag{36.44.6}$$

Además

$$G(z,w) = \frac{zF(z) - wP(z)\,G(0,w)}{z - wR(z)}, \tag{36.44.7}$$

con un único polo en el círculo unitario, además, el polo es de la forma $z = \theta(w)$ y satisface que

i) $\tilde{\theta}(1) = 1$,

ii) $\tilde{\theta}^{(1)}(1) = \frac{1}{1-\tilde{\mu}}$,

iii) $\tilde{\theta}^{(2)}(1) = \frac{\tilde{\mu}}{(1-\tilde{\mu})^2} + \frac{\tilde{\sigma}}{(1-\tilde{\mu})^3}$.

Finalmente, además se cumple que

$$\mathbb{E}\left[w^T\right] = G(0,w) = F\left[\tilde{\theta}(w)\right]. \tag{36.44.8}$$

Multiplicando las ecuaciones (36.81.2) y (36.81.3) por el término z^k:

$$\begin{aligned}
g_{n,k}z^k &= \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}P\{X_n = k-j-l+1\}P\{Y_n = l\}z^k,\\
g_{0,k}z^k &= P\left\{\tilde{L}_0 = k\right\}z^k,
\end{aligned}$$

ahora sumamos sobre k

$$\begin{aligned}
\sum_{k=0}^{\infty} g_{n,k}z^k &= \sum_{k=0}^{\infty}\sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}P\{X_n = k-j-l+1\}P\{Y_n = l\}z^k\\
&= \sum_{k=0}^{\infty} z^k \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}P\{X_n = k-(j+l-1)\}P\{Y_n = l\}\\
&= \sum_{k=0}^{\infty} z^{k+(j+l-1)-(j+l-1)} \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}P\{X_n = k-(j+l-1)\}P\{Y_n = l\}\\
&= \sum_{k=0}^{\infty}\sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}z^{j-1}P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}P\{Y_n = l\}z^l\\
&= \sum_{j=1}^{\infty}\sum_{l=1}^{j} g_{n-1,j}z^{j-1}\sum_{k=j+l-1}^{\infty} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}P\{Y_n = l\}z^l\\
&= \sum_{j=1}^{\infty} g_{n-1,j}z^{j-1}\sum_{l=1}^{j}\sum_{k=j+l-1}^{\infty} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}P\{Y_n = l\}z^l\\
&= \sum_{j=1}^{\infty} g_{n-1,j}z^{j-1}\sum_{k=j+l-1}^{\infty}\sum_{l=1}^{j} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}P\{Y_n = l\}z^l
\end{aligned}$$

luego

$$\begin{aligned}
&= \sum_{j=1}^{\infty} g_{n-1,j}z^{j-1}\sum_{k=j+l-1}^{\infty}\sum_{l=1}^{j} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}\sum_{l=1}^{j} P\{Y_n = l\}z^l\\
&= \sum_{j=1}^{\infty} g_{n-1,j}z^{j-1}\sum_{l=1}^{\infty} P\{Y_n = l\}z^l\sum_{k=j+l-1}^{\infty}\sum_{l=1}^{j} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}\\
&= \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z)\sum_{k=j+l-1}^{\infty}\sum_{l=1}^{j} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}\\
&= \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z)P(z) = \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z),
\end{aligned}$$

es decir la ecuación (36.81.4) se puede reescribir como

$$G_n(z) = \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z). \tag{36.44.9}$$

Por otra parte recordemos la ecuación (36.81.4)

$$G_n(z) = \sum_{k=0}^{\infty} g_{n,k} z^k, \text{ entonces } \frac{G_n(z)}{z} = \sum_{k=1}^{\infty} g_{n,k} z^{k-1},$$

Por lo tanto utilizando la ecuación (36.81.9):

$$\begin{aligned} G(z,w) &= \sum_{n=0}^{\infty} G_n(z) w^n = G_0(z) + \sum_{n=1}^{\infty} G_n(z) w^n = F(z) + \sum_{n=0}^{\infty}\left[G_n(z) - G_n(0)\right] w^n \frac{\tilde{P}(z)}{z} \\ &= F(z) + \frac{w}{z}\sum_{n=0}^{\infty}\left[G_n(z) - G_n(0)\right] w^{n-1}\tilde{P}(z) \end{aligned}$$

es decir

$$G(z,w) = F(z) + \frac{w}{z}\left[G(z,w) - G(0,w)\right]\tilde{P}(z),$$

entonces

$$\begin{aligned} G(z,w) = F(z) + \frac{w}{z}\left[G(z,w) - G(0,w)\right]\tilde{P}(z) &= F(z) + \frac{w}{z}\tilde{P}(z)G(z,w) - \frac{w}{z}\tilde{P}(z)G(0,w) \\ &\Leftrightarrow \\ G(z,w)\left\{1 - \frac{w}{z}\tilde{P}(z)\right\} &= F(z) - \frac{w}{z}\tilde{P}(z)G(0,w), \end{aligned}$$

por lo tanto,

$$G(z,w) = \frac{zF(z) - w\tilde{P}(z)G(0,w)}{1 - w\tilde{P}(z)}. \tag{36.44.10}$$

Ahora $G(z,w)$ es analítica en $|z| = 1$. Sean z, w tales que $|z| = 1$ y $|w| \leq 1$, como $\tilde{P}(z)$ es FGP

$$|z - \left(z - w\tilde{P}(z)\right)| < |z| \Leftrightarrow |w\tilde{P}(z)| < |z|$$

es decir, se cumplen las condiciones del Teorema de Rouché y por tanto, z y $z - w\tilde{P}(z)$ tienen el mismo número de ceros en $|z| = 1$. Sea $z = \tilde{\theta}(w)$ la solución única de $z - w\tilde{P}(z)$, es decir

$$\tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right) = 0, \tag{36.44.11}$$

con $|\tilde{\theta}(w)| < 1$. Cabe hacer mención que $\tilde{\theta}(w)$ es la FGP para el tiempo de ruina cuando $\tilde{L}_0 = 1$.

Considerando la ecuación (36.81.11)

$$\begin{aligned} 0 &= \frac{\partial}{\partial w}\tilde{\theta}(w)|_{w=1} - \frac{\partial}{\partial w}\left\{w\tilde{P}\left(\tilde{\theta}(w)\right)\right\}|_{w=1} = \tilde{\theta}^{(1)}(w)|_{w=1} - \frac{\partial}{\partial w} w\left\{\tilde{P}\left(\tilde{\theta}(w)\right)\right\}|_{w=1} \\ &- w\frac{\partial}{\partial w}\tilde{P}\left(\tilde{\theta}(w)\right)|_{w=1} = \tilde{\theta}^{(1)}(1) - \tilde{P}\left(\tilde{\theta}(1)\right) - w\left\{\frac{\partial\tilde{P}\left(\tilde{\theta}(w)\right)}{\partial\tilde{\theta}(w)} \cdot \frac{\partial\tilde{\theta}(w)}{\partial w}|_{w=1}\right\} \\ &\tilde{\theta}^{(1)}(1) - \tilde{P}\left(\tilde{\theta}(1)\right) - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right) \cdot \tilde{\theta}^{(1)}(1), \end{aligned}$$

luego

$$\tilde{P}\left(\tilde{\theta}(1)\right) = \tilde{\theta}^{(1)}(1) - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right) \cdot \tilde{\theta}^{(1)}(1) = \tilde{\theta}^{(1)}(1)\left(1 - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)\right),$$

por tanto

$$\tilde{\theta}^{(1)}(1) = \frac{\tilde{P}\left(\tilde{\theta}(1)\right)}{\left(1 - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)\right)} = \frac{1}{1 - \tilde{\mu}}.$$

Ahora determinemos el segundo momento de $\tilde{\theta}(w)$, nuevamente consideremos la ecuación (36.81.11):

$$0 = \tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right) \Rightarrow 0 = \frac{\partial}{\partial w}\left\{\tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right)\right\} \Rightarrow 0 = \frac{\partial}{\partial w}\left\{\frac{\partial}{\partial w}\left\{\tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right)\right\}\right\}$$

luego

$$
\begin{aligned}
& \frac{\partial}{\partial w}\left\{\frac{\partial}{\partial w}\tilde{\theta}(w)-\frac{\partial}{\partial w}\left[w\tilde{P}\left(\tilde{\theta}(w)\right)\right]\right\}=\frac{\partial}{\partial w}\left\{\frac{\partial}{\partial w}\tilde{\theta}(w)-\frac{\partial}{\partial w}\left[w\tilde{P}\left(\tilde{\theta}(w)\right)\right]\right\} \\
= & \frac{\partial}{\partial w}\left\{\frac{\partial\tilde{\theta}(w)}{\partial w}-\left[\tilde{P}\left(\tilde{\theta}(w)\right)+w\frac{\partial}{\partial w}R\left(\tilde{\theta}(w)\right)\right]\right\}=\frac{\partial}{\partial w}\left\{\frac{\partial\tilde{\theta}(w)}{\partial w}-\left[\tilde{P}\left(\tilde{\theta}(w)\right)+w\frac{\partial\tilde{P}\left(\tilde{\theta}(w)\right)}{\partial w}\frac{\partial\tilde{\theta}(w)}{\partial w}\right]\right\} \\
= & \frac{\partial}{\partial w}\left\{\tilde{\theta}^{(1)}(w)-\tilde{P}\left(\tilde{\theta}(w)\right)-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)\right\} \\
= & \frac{\partial}{\partial w}\tilde{\theta}^{(1)}(w)-\frac{\partial}{\partial w}\tilde{P}\left(\tilde{\theta}(w)\right)-\frac{\partial}{\partial w}\left[w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)\right] \\
= & \frac{\partial}{\partial w}\tilde{\theta}^{(1)}(w)-\frac{\partial\tilde{P}\left(\tilde{\theta}(w)\right)}{\partial\tilde{\theta}(w)}\frac{\partial\tilde{\theta}(w)}{\partial w}-\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)-w\frac{\partial\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}{\partial w}\tilde{\theta}^{(1)}(w)-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\frac{\partial\tilde{\theta}^{(1)}(w)}{\partial w} \\
= & \tilde{\theta}^{(2)}(w)-\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)-\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)-w\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)\left(\tilde{\theta}^{(1)}(w)\right)^{2}-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(2)}(w) \\
= & \tilde{\theta}^{(2)}(w)-2\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)-w\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)\left(\tilde{\theta}^{(1)}(w)\right)^{2}-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(2)}(w) \\
= & \tilde{\theta}^{(2)}(w)\left[1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right]-\tilde{\theta}^{(1)}(w)\left[w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)+2\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right]
\end{aligned}
$$

luego

$$
\begin{aligned}
\tilde{\theta}^{(2)}(w)\left[1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right] & - \tilde{\theta}^{(1)}(w)\left[w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)+2\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right]=0 \\
\tilde{\theta}^{(2)}(w) & = \frac{\tilde{\theta}^{(1)}(w)\left[w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)+2R^{(1)}\left(\tilde{\theta}(w)\right)\right]}{1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)} \\
\tilde{\theta}^{(2)}(w) & = \frac{\tilde{\theta}^{(1)}(w)w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)}{1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}+\frac{2\tilde{\theta}^{(1)}(w)\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}{1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}
\end{aligned}
$$

si evaluamos la expresión anterior en $w=1$:

$$
\begin{aligned}
\tilde{\theta}^{(2)}(1) & = \frac{\left(\tilde{\theta}^{(1)}(1)\right)^{2}\tilde{P}^{(2)}\left(\tilde{\theta}(1)\right)}{1-\tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)}+\frac{2\tilde{\theta}^{(1)}(1)\tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)}{1-\tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)}=\frac{\left(\tilde{\theta}^{(1)}(1)\right)^{2}\tilde{P}^{(2)}(1)}{1-\tilde{P}^{(1)}(1)}+\frac{2\tilde{\theta}^{(1)}(1)\tilde{P}^{(1)}(1)}{1-\tilde{P}^{(1)}(1)} \\
& = \frac{\left(\frac{1}{1-\tilde{\mu}}\right)^{2}\tilde{P}^{(2)}(1)}{1-\tilde{\mu}}+\frac{2\left(\frac{1}{1-\tilde{\mu}}\right)\tilde{\mu}}{1-\tilde{\mu}}=\frac{\tilde{P}^{(2)}(1)}{(1-\tilde{\mu})^{3}}+\frac{2\tilde{\mu}}{(1-\tilde{\mu})^{2}}=\frac{\sigma^{2}-\tilde{\mu}+\tilde{\mu}^{2}}{(1-\tilde{\mu})^{3}}+\frac{2\tilde{\mu}}{(1-\tilde{\mu})^{2}} \\
& = \frac{\sigma^{2}-\tilde{\mu}+\tilde{\mu}^{2}+2\tilde{\mu}(1-\tilde{\mu})}{(1-\tilde{\mu})^{3}}
\end{aligned}
$$

es decir

$$
\tilde{\theta}^{(2)}(1) = \frac{\sigma^{2}+\tilde{\mu}-\tilde{\mu}^{2}}{(1-\tilde{\mu})^{3}}=\frac{\sigma^{2}}{(1-\tilde{\mu})^{3}}+\frac{\tilde{\mu}(1-\tilde{\mu})}{(1-\tilde{\mu})^{3}}=\frac{\sigma^{2}}{(1-\tilde{\mu})^{3}}+\frac{\tilde{\mu}}{(1-\tilde{\mu})^{2}}.
$$

Corolario 36.44.1 *El tiempo de ruina del jugador tiene primer y segundo momento dados por*

$$
\mathbb{E}[T] = \frac{\mathbb{E}\left[\tilde{L}_{0}\right]}{1-\tilde{\mu}} \tag{36.44.12}
$$

$$
Var[T] = \frac{Var\left[\tilde{L}_{0}\right]}{(1-\tilde{\mu})^{2}}+\frac{\sigma^{2}\mathbb{E}\left[\tilde{L}_{0}\right]}{(1-\tilde{\mu})^{3}}. \tag{36.44.13}
$$

36.45. Procesos de Llegadas a las colas en la RSVC

Se definen los procesos de llegada de los usuarios a cada una de las colas dependiendo de la llegada del servidor pero del sistema al cuál no pertenece la cola en cuestión:

Para el sistema 1 y el servidor del segundo sistema

$$F_{i,j}\left(z_i;\zeta_j\right)=\mathbb{E}\left[z_i^{L_i(\zeta_j)}\right]=\sum_{k=0}^{\infty}\mathbb{P}\left[L_i\left(\zeta_j\right)=k\right]z_i^k,\text{ para } i,j=1,2.$$

Ahora se definen para el segundo sistema y el servidor del primero

$$\hat{F}_{i,j}\left(w_i;\tau_j\right) = \mathbb{E}\left[w_i^{\hat{L}_i(\tau_j)}\right]=\sum_{k=0}^{\infty}\mathbb{P}\left[\hat{L}_i\left(\tau_j\right)=k\right]w_i^k,\text{ para } i,j=1,2.$$

Ahora, con lo anterior definamos la FGP conjunta para el segundo sistema;

$$\mathbb{E}\left[w_1^{\hat{L}_1(\tau_j)}w_2^{\hat{L}_2(\tau_j)}\right] = \mathbb{E}\left[w_1^{\hat{L}_1(\tau_j)}\right]\mathbb{E}\left[w_2^{\hat{L}_2(\tau_j)}\right]=\hat{F}_{1,j}\left(w_1;\tau_j\right)\hat{F}_{2,j}\left(w_2;\tau_j\right)=\hat{F}_j\left(w_1,w_2;\tau_j\right).$$

Con respecto al sistema 1 se tiene la FGP conjunta con respecto al servidor del otro sistema:

$$\mathbb{E}\left[z_1^{L_1(\zeta_j)}z_2^{L_2(\zeta_j)}\right] = \mathbb{E}\left[z_1^{L_1(\zeta_j)}\right]\mathbb{E}\left[z_2^{L_2(\zeta_j)}\right]=F_{1,j}\left(z_1;\zeta_j\right)F_{2,j}\left(z_2;\zeta_j\right)=F_j\left(z_1,z_2;\zeta_j\right).$$

Ahora analicemos la Red de Sistemas de Visitas Cíclicas, entonces se define la PGF conjunta al tiempo t para los tiempos de visita del servidor en cada una de las colas, para comenzar a dar servicio, definidos anteriormente al tiempo $t=\{\tau_1,\tau_2,\zeta_1,\zeta_2\}$:

$$F_j\left(z_1,z_2,w_1,w_2\right) = \mathbb{E}\left[\prod_{i=1}^{2}z_i^{L_i(\tau_j)}\prod_{i=1}^{2}w_i^{\hat{L}_i(\tau_j)}\right] \tag{36.45.1}$$

$$\hat{F}_j\left(z_1,z_2,w_1,w_2\right) = \mathbb{E}\left[\prod_{i=1}^{2}z_i^{L_i(\zeta_j)}\prod_{i=1}^{2}w_i^{\hat{L}_i(\zeta_j)}\right] \tag{36.45.2}$$

para $j=1,2$. Entonces, con la finalidad de encontrar el número de usuarios presentes en el sistema cuando el servidor deja de atender una de las colas de cualquier sistema se tiene lo siguiente

$$\begin{aligned}
&\mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)}z_2^{L_2(\overline{\tau}_1)}w_1^{\hat{L}_1(\overline{\tau}_1)}w_2^{\hat{L}_2(\overline{\tau}_1)}\right]=\mathbb{E}\left[z_2^{L_2(\overline{\tau}_1)}w_1^{\hat{L}_1(\overline{\tau}_1)}w_2^{\hat{L}_2(\overline{\tau}_1)}\right]\\
=\;&\mathbb{E}\left[z_2^{L_2(\tau_1)+X_2(\overline{\tau}_1-\tau_1)+Y_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{L}_1(\tau_1)+\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{L}_2(\tau_1)+\hat{X}_2(\overline{\tau}_1-\tau_1)}\right]
\end{aligned}$$

utilizando la ecuacion dada (37.4.1), luego

$$\begin{aligned}
=\;&\mathbb{E}\left[z_2^{L_2(\tau_1)}z_2^{X_2(\overline{\tau}_1-\tau_1)}z_2^{Y_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{L}_1(\tau_1)}w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{L}_2(\tau_1)}w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right]\\
=\;&\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right\}\left\{z_2^{X_2(\overline{\tau}_1-\tau_1)}z_2^{Y_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right]
\end{aligned}$$

Aplicando el hecho de que el número de usuarios que llegan a cada una de las colas del segundo sistema es independiente de las llegadas a las colas del primer sistema:

$$=\;\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{z_2^{X_2(\overline{\tau}_1-\tau_1)}z_2^{Y_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]$$

dado que los arribos a cada una de las colas son independientes, podemos separar la esperanza para los procesos de llegada a Q_1 y Q_2 al tiempo τ_1, que es el tiempo en que el servidor visita a Q_1. Recordando que $\tilde{X}_2\left(z_2\right)=X_2\left(z_2\right)+Y_2\left(z_2\right)$ se tiene

$$\begin{aligned}
=\;&\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{z_2^{\tilde{X}_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]\\
=\;&\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{\tilde{P}_2\left(z_2\right)^{\overline{\tau}_1-\tau_1}\hat{P}_1\left(w_1\right)^{\overline{\tau}_1-\tau_1}\hat{P}_2\left(w_2\right)^{\overline{\tau}_1-\tau_1}\right\}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]\\
=\;&\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right\}^{\overline{\tau}_1-\tau_1}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]\\
=\;&\mathbb{E}\left[z_2^{L_2(\tau_1)}\theta_1\left(\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right)^{L_1(\tau_1)}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]\\
=\;&F_1\left(\theta_1\left(\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),z2\right)\hat{F}_1\left(w_1,w_2;\tau_1\right)\\
\equiv\;&F_1\left(\theta_1\left(\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),z_2,w_1,w_2\right)
\end{aligned}$$

Las igualdades anteriores son ciertas pues el número de usuarios que llegan a $\hat{Q}_2$ durante el intervalo $[\tau_1, \overline{\tau}_1]$ aún no han sido atendidos por el servidor del sistema 2 y por tanto aún no pueden pasar al sistema 1 a traves de Q_2. Por tanto el número de usuarios que pasan de $\hat{Q}_2$ a Q_2 en el intervalo de tiempo $[\tau_1, \overline{\tau}_1]$ depende de la política de traslado entre los dos sistemas, conforme a la sección anterior.

Por lo tanto

$$\mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)} z_2^{L_2(\overline{\tau}_1)} w_1^{\hat{L}_1(\overline{\tau}_1)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right] = F_1\left(\theta_1\left(\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right), z_2, w_1, w_2\right) \tag{36.45.3}$$

$$= F_1\left(\theta_1\left(\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right), z2\right)\hat{F}_1(w_1, w_2; \tau_1) \tag{36.45.4}$$

Utilizando un razonamiento análogo para $\overline{\tau}_2$:

$$\begin{aligned}
& \mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)} z_2^{L_2(\overline{\tau}_2)} w_1^{\hat{L}_1(\overline{\tau}_2)} w_2^{\hat{L}_2(\overline{\tau}_2)}\right] = \mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)} w_1^{\hat{L}_1(\overline{\tau}_2)} w_2^{\hat{L}_2(\overline{\tau}_2)}\right] \\
= \; & \mathbb{E}\left[z_1^{L_1(\tau_2)+X_1(\overline{\tau}_2-\tau_2)} w_1^{\hat{L}_1(\tau_2)+\hat{X}_1(\overline{\tau}_2-\tau_2)} w_2^{\hat{L}_2(\tau_2)+\hat{X}_2(\overline{\tau}_2-\tau_2)}\right] \\
= \; & \mathbb{E}\left[z_1^{L_1(\tau_2)} z_1^{X_1(\overline{\tau}_2-\tau_2)} w_1^{\hat{L}_1(\tau_2)} w_1^{\hat{X}_1(\overline{\tau}_2-\tau_2)} w_2^{\hat{L}_2(\tau_2)} w_2^{\hat{X}_2(\overline{\tau}_2-\tau_2)}\right] \\
= \; & \mathbb{E}\left[z_1^{L_1(\tau_2)} z_1^{X_1(\overline{\tau}_2-\tau_2)} w_1^{\hat{X}_1(\overline{\tau}_2-\tau_2)} w_2^{\hat{X}_2(\overline{\tau}_2-\tau_2)}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)} w_2^{\hat{L}_2(\tau_2)}\right] \\
= \; & \mathbb{E}\left[z_1^{L_1(\tau_2)} P_1(z_1)^{\overline{\tau}_2-\tau_2}\hat{P}_1(w_1)^{\overline{\tau}_2-\tau_2}\hat{P}_2(w_2)^{\overline{\tau}_2-\tau_2}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)} w_2^{\hat{L}_2(\tau_2)}\right]
\end{aligned}$$

utlizando la proposición (36.81.1) referente al problema de la ruina del jugador:

$$\begin{aligned}
= \; & \mathbb{E}\left[z_1^{L_1(\tau_2)}\left\{P_1(z_1)\hat{P}_1(w_1)\hat{P}_2(w_2)\right\}^{\overline{\tau}_2-\tau_2}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)} w_2^{\hat{L}_2(\tau_2)}\right] \\
= \; & \mathbb{E}\left[z_1^{L_1(\tau_2)}\tilde{\theta}_2\left(P_1(z_1)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)^{L_2(\tau_2)}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)} w_2^{\hat{L}_2(\tau_2)}\right] \\
= \; & F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)\right)\hat{F}_2(w_1, w_2; \tau_2)
\end{aligned}$$

entonces se define

$$\mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)} z_2^{L_2(\overline{\tau}_2)} w_1^{\hat{L}_1(\overline{\tau}_2)} w_2^{\hat{L}_2(\overline{\tau}_2)}\right] = F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\hat{P}_1(w_1)\hat{P}_2(w_2)\right), w_1, w_2\right) \tag{36.45.5}$$

$$\equiv F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)\right)\hat{F}_2(w_1, w_2; \tau_2) \tag{36.45.6}$$

Ahora para $\overline{\zeta}_1$:

$$\begin{aligned}
& \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)} z_2^{L_2(\overline{\zeta}_1)} w_1^{\hat{L}_1(\overline{\zeta}_1)} w_2^{\hat{L}_2(\overline{\zeta}_1)}\right] = \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)} z_2^{L_2(\overline{\zeta}_1)} w_2^{\hat{L}_2(\overline{\zeta}_1)}\right] \\
= \; & \mathbb{E}\left[z_1^{L_1(\zeta_1)} z_1^{X_1(\overline{\zeta}_1-\zeta_1)} z_2^{L_2(\zeta_1)} z_2^{X_2(\overline{\zeta}_1-\zeta_1)} z_2^{Y_2(\overline{\zeta}_1-\zeta_1)} w_2^{\hat{L}_2(\zeta_1)} w_2^{\hat{X}_2(\overline{\zeta}_1-\zeta_1)}\right] \\
= \; & \mathbb{E}\left[z_1^{L_1(\zeta_1)} z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[z_1^{X_1(\overline{\zeta}_1-\zeta_1)} z_2^{\hat{X}_2(\overline{\zeta}_1-\zeta_1)} w_2^{\hat{X}_2(\overline{\zeta}_1-\zeta_1)} w_2^{\hat{L}_2(\zeta_1)}\right] \\
= \; & \mathbb{E}\left[z_1^{L_1(\zeta_1)} z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[P_1(z_1)^{\overline{\zeta}_1-\zeta_1}\tilde{P}_2(z_2)^{\overline{\zeta}_1-\zeta_1}\hat{P}_2(w_2)^{\overline{\zeta}_1-\zeta_1} w_2^{\hat{L}_2(\zeta_1)}\right] \\
= \; & \mathbb{E}\left[z_1^{L_1(\zeta_1)} z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[\left\{P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right\}^{\overline{\zeta}_1-\zeta_1} w_2^{\hat{L}_2(\zeta_1)}\right] \\
= \; & \mathbb{E}\left[z_1^{L_1(\zeta_1)} z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[\hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right)^{\hat{L}_1(\zeta_1)} w_2^{\hat{L}_2(\zeta_1)}\right] \\
= \; & F_1(z_1, z_2; \zeta_1)\hat{F}_1\left(\hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right), w_2\right)
\end{aligned}$$

es decir,

$$\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)} z_2^{L_2(\overline{\zeta}_1)} w_1^{\hat{L}_1(\overline{\zeta}_1)} w_2^{\hat{L}_2(\overline{\zeta}_1)}\right] = \hat{F}_1\left(z_1, z_2, \hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right), w_2\right) \tag{36.45.7}$$

$$= F_1(z_1, z_2; \zeta_1)\hat{F}_1\left(\hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right), w_2\right). \tag{36.45.8}$$

Finalmente para $\overline{\zeta}_2$:

$$\begin{aligned}
& \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)} w_2^{\hat{L}_2(\overline{\zeta}_2)}\right] = \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)}\right] \\
= & \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_1^{X_1(\overline{\zeta}_2-\zeta_2)} z_2^{L_2(\zeta_2)} z_2^{X_2(\overline{\zeta}_2-\zeta_2)} z_2^{Y_2(\overline{\zeta}_2-\zeta_2)} w_1^{\hat{L}_1(\zeta_2)} w_1^{\hat{X}_1(\overline{\zeta}_2-\zeta_2)}\right] \\
= & \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_2^{L_2(\zeta_2)}\right] \mathbb{E}\left[z_1^{X_1(\overline{\zeta}_2-\zeta_2)} z_2^{\tilde{X}_2(\overline{\zeta}_2-\zeta_2)} w_1^{\hat{X}_1(\overline{\zeta}_2-\zeta_2)} w_1^{\hat{L}_1(\zeta_2)}\right] \\
= & \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_2^{L_2(\zeta_2)}\right] \mathbb{E}\left[P_1(z_1)^{\overline{\zeta}_2-\zeta_2} \tilde{P}_2(z_2)^{\overline{\zeta}_2-\zeta_2} \hat{P}(w_1)^{\overline{\zeta}_2-\zeta_2} w_1^{\hat{L}_1(\zeta_2)}\right] \\
= & \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_2^{L_2(\zeta_2)}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\zeta_2)} \left\{P_1(z_1) \tilde{P}_2(z_2) \hat{P}(w_1)\right\}^{\overline{\zeta}_2-\zeta_2}\right] \\
= & \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_2^{L_2(\zeta_2)}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\zeta_2)} \hat{\theta}_2\left(P_1(z_1) \tilde{P}_2(z_2) \hat{P}(w_1)\right)^{\hat{L}_2\zeta_2}\right] \\
= & F_2(z_1, z_2; \zeta_2) \hat{F}_2\left(w_1, \hat{\theta}_2\left(P_1(z_1) \tilde{P}_2(z_2) \hat{P}_1(w_1)\right)\right]
\end{aligned}$$

es decir

$$\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)} w_2^{\hat{L}_2(\overline{\zeta}_2)}\right] = \hat{F}_2\left(z_1, z_2, w_1, \hat{\theta}_2\left(P_1(z_1) \tilde{P}_2(z_2) \hat{P}_1(w_1)\right)\right) \tag{36.45.9}$$

$$= F_2(z_1, z_2; \zeta_2) \hat{F}_2\left(w_1, \hat{\theta}_2\left(P_1(z_1) \tilde{P}_2(z_2) \hat{P}_1(w_1)\right)\right) \tag{36.45.10}$$

36.46. Ecuaciones Recursivas para la R.S.V.C.

Con lo desarrollado hasta ahora podemos encontrar las ecuaciones recursivas que modelan la Red de Sistemas de Visitas Cíclicas (R.S.V.C):

$$\begin{aligned}
F_2(z_1, z_2, w_1, w_2) &= R_1(z_1, z_2, w_1, w_2) \mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)} z_2^{L_2(\overline{\tau}_1)} w_1^{\hat{L}_1(\overline{\tau}_1)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right] \\
&= R_1\left(P_1(z_1) \tilde{P}_2(z_2) \prod_{i=1}^{2} \hat{P}_i(w_i)\right) F_1\left(\theta_1\left(\tilde{P}_2(z_2) \hat{P}_1(w_1) \hat{P}_2(w_2)\right), z_2, w_1, w_2\right)
\end{aligned}$$

$$\begin{aligned}
F_1(z_1, z_2, w_1, w_2) &= R_2(z_1, z_2, w_1, w_2) \mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)} z_2^{L_2(\overline{\tau}_2)} w_1^{\hat{L}_1(\overline{\tau}_2)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right] \\
&= R_2\left(P_1(z_1) \tilde{P}_2(z_2) \prod_{i=1}^{2} \hat{P}_i(w_i)\right) F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1) \hat{P}_1(w_1) \hat{P}_2(w_2)\right), w_1, w_2\right)
\end{aligned}$$

que son equivalentes a las siguientes ecuaciones

$$\hat{F}_2(z_1, z_2, w_1, w_2) = \hat{R}_1(z_1, z_2, w_1, w_2) \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)} z_2^{L_2(\overline{\zeta}_1)} w_1^{\hat{L}_1(\overline{\zeta}_1)} w_2^{\hat{L}_2(\overline{\zeta}_1)}\right]$$

$$\hat{F}_1(z_1, z_2, w_1, w_2) = \hat{R}_2(z_1, z_2, w_1, w_2) \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)} w_2^{\hat{L}_2(\overline{\zeta}_2)}\right]$$

que son equivalentes a las siguientes ecuaciones

$$\hat{F}_2(z_1, z_2, w_1, w_2) = \hat{R}_1\left(P_1(z_1) \tilde{P}_2(z_2) \prod_{i=1}^{2} \hat{P}_i(w_i)\right) \hat{F}_1\left(z_1, z_2, \hat{\theta}_1\left(P_1(z_1) \tilde{P}_2(z_2) \hat{P}_2(w_2)\right), w_2\right) \tag{36.46.1}$$

$$\hat{F}_1(z_1, z_2, w_1, w_2) = \hat{R}_2\left(P_1(z_1) \tilde{P}_2(z_2) \prod_{i=1}^{2} \hat{P}_i(w_i)\right) \hat{F}_2\left(z_1, z_2, w_1, \hat{\theta}_2\left(P_1(z_1) \tilde{P}_2(z_2) \hat{P}_1(w_1)\right)\right) \tag{36.46.2}$$

36.46.1. Tiempos de Traslado del Servidor

Para

$$R_1(\mathbf{z}, \mathbf{w}) = R_1\left((P_1(z_1) \tilde{P}_2(z_2) \hat{P}_1(w_1) \hat{P}_2(w_2)\right) \tag{36.46.3}$$

se tiene que

$$\frac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} = R_1^{(1)}(1)\,P_1^{(1)}(1) = r_1\mu_1, \quad \frac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} = R_1^{(1)}(1)\,\tilde{P}_2^{(1)}(1) = r_1\tilde{\mu}_2,$$
$$\frac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} = R_1^{(1)}(1)\,\hat{P}_1^{(1)}(1) = r_1\hat{\mu}_1, \quad \frac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} = R_1^{(1)}(1)\,\hat{P}_2^{(1)}(1) = r_1\hat{\mu}_2,$$

Análogamente se tiene

$$R_2(\mathbf{z},\mathbf{w}) = R_2\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right) \tag{36.46.4}$$

$$\frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} = R_2^{(1)}(1)\,P_1^{(1)}(1) = r_2\mu_1, \quad \frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} = R_2^{(1)}(1)\,\tilde{P}_2^{(1)}(1) = r_2\tilde{\mu}_2,$$
$$\frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} = R_2^{(1)}(1)\,\hat{P}_1^{(1)}(1) = r_2\hat{\mu}_1, \quad \frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} = R_2^{(1)}(1)\,\hat{P}_2^{(1)}(1) = r_2\hat{\mu}_2,$$

Para el segundo sistema:

$$\hat{R}_1(\mathbf{z},\mathbf{w}) = \hat{R}_1\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right) \tag{36.46.5}$$

$$\frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_1^{(1)}(1)\,P_1^{(1)}(1) = \hat{r}_1\mu_1, \quad \frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_1^{(1)}(1)\,\tilde{P}_2^{(1)}(1) = \hat{r}_1\tilde{\mu}_2,$$
$$\frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_1^{(1)}(1)\,\hat{P}_1^{(1)}(1) = \hat{r}_1\hat{\mu}_1, \quad \frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_1^{(1)}(1)\,\hat{P}_2^{(1)}(1) = \hat{r}_1\hat{\mu}_2,$$

Finalmente

$$\hat{R}_2(\mathbf{z},\mathbf{w}) = \hat{R}_2\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right) \tag{36.46.6}$$

$$\frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_2^{(1)}(1)\,P_1^{(1)}(1) = \hat{r}_2\mu_1, \quad \frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_2^{(1)}(1)\,\tilde{P}_2^{(1)}(1) = \hat{r}_2\tilde{\mu}_2,$$
$$\frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_2^{(1)}(1)\,\hat{P}_1^{(1)}(1) = \hat{r}_2\hat{\mu}_1, \quad \frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_2^{(1)}(1)\,\hat{P}_2^{(1)}(1) = \hat{r}_2\hat{\mu}_2.$$

36.46.2. Usuarios presentes en la cola

Hagamos lo correspondiente con las siguientes expresiones obtenidas en la sección anterior: Recordemos que

$$F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right) = F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2\right)\hat{F}_1(w_1, w_2; \tau_1)$$

entonces

$$\begin{aligned}
\frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= 0 \\
\frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_1}{\partial z_1}\cdot\frac{\partial \theta_1}{\partial \tilde{P}_2}\cdot\frac{\partial \tilde{P}_2}{\partial z_2} + \frac{\partial F_1}{\partial z_2} \\
\frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_1}{\partial z_1}\cdot\frac{\partial \theta_1}{\partial \hat{P}_1}\cdot\frac{\partial \hat{P}_1}{\partial w_1} + \frac{\partial \hat{F}_1}{\partial w_1} \\
\frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_1}{\partial z_1}\cdot\frac{\partial \theta_1}{\partial \hat{P}_2}\cdot\frac{\partial \hat{P}_2}{\partial w_2} + \frac{\partial \hat{F}_1}{\partial w_2}
\end{aligned}$$

para τ_2:

$$F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), w_1, w_2\right) = F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right)\right)\hat{F}_2(w_1, w_2; \tau_2)$$

al igual que antes

$$
\begin{aligned}
\frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_2}{\partial z_2}\cdot\frac{\partial\tilde{\theta}_2}{\partial P_1}\cdot\frac{\partial P_1}{\partial z_2}+\frac{\partial F_2}{\partial z_1}\\
\frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= 0\\
\frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_2}{\partial z_2}\cdot\frac{\partial\tilde{\theta}_2}{\partial\hat{P}_1}\cdot\frac{\partial\hat{P}_1}{\partial w_1}+\frac{\partial\hat{F}_2}{\partial w_1}\\
\frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_2}{\partial z_2}\cdot\frac{\partial\tilde{\theta}_2}{\partial\hat{P}_2}\cdot\frac{\partial\hat{P}_2}{\partial w_2}+\frac{\partial\hat{F}_2}{\partial w_2}
\end{aligned}
$$

Ahora para el segundo sistema

$$
\hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)=F_1\left(z_1,z_2;\zeta_1\right)\hat{F}_1\left(\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)
$$

entonces

$$
\begin{aligned}
\frac{\partial\hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial\hat{F}_1}{\partial w_1}\cdot\frac{\partial\hat{\theta}_1}{\partial P_1}\cdot\frac{\partial P_1}{\partial z_1}+\frac{\partial F_1}{\partial z_1}\\
\frac{\partial\hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial\hat{F}_1}{\partial w_1}\cdot\frac{\partial\hat{\theta}_1}{\partial\tilde{P}_2}\cdot\frac{\partial\tilde{P}_2}{\partial z_2}+\frac{\partial F_1}{\partial z_2}\\
\frac{\partial\hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= 0\\
\frac{\partial\hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial\hat{F}_1}{\partial w_1}\cdot\frac{\partial\hat{\theta}_1}{\partial\hat{P}_2}\cdot\frac{\partial\hat{P}_2}{\partial w_2}+\frac{\partial\hat{F}_1}{\partial w_2}
\end{aligned}
$$

Finalmente para ζ_2

$$
\hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right) = F_2\left(z_1,z_2;\zeta_2\right)\hat{F}_2\left(w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right]
$$

por tanto:

$$
\begin{aligned}
\frac{\partial\hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial\hat{F}_2}{\partial w_2}\cdot\frac{\partial\hat{\theta}_2}{\partial P_1}\cdot\frac{\partial P_1}{\partial z_1}+\frac{\partial F_2}{\partial z_1}\\
\frac{\partial\hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial\hat{F}_2}{\partial w_2}\cdot\frac{\partial\hat{\theta}_2}{\partial\tilde{P}_2}\cdot\frac{\partial\tilde{P}_2}{\partial z_2}+\frac{\partial F_2}{\partial z_2}\\
\frac{\partial\hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial\hat{F}_2}{\partial w_2}\cdot\frac{\partial\hat{\theta}_2}{\partial\hat{P}_1}\cdot\frac{\partial\hat{P}_1}{\partial w_1}+\frac{\partial\hat{F}_2}{\partial w_1}\\
\frac{\partial\hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= 0
\end{aligned}
$$

36.46.3. Ecuaciones Recursivas

Entonces, de todo lo desarrollado hasta ahora se tienen las siguientes ecuaciones:

$$
\begin{aligned}
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= r_1\mu_1 \\
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= = r_1\tilde{\mu}_2 + f_1(1)\left(\frac{1}{1-\mu_1}\right)\tilde{\mu}_2 + f_1(2) \\
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= r_1\hat{\mu}_1 + f_1(1)\left(\frac{1}{1-\mu_1}\right)\hat{\mu}_1 + \hat{F}^{(1)}_{1,1}(1) \\
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= r_1\hat{\mu}_2 + f_1(1)\left(\frac{1}{1-\mu_1}\right)\hat{\mu}_2 + \hat{F}^{(1)}_{2,1}(1) \\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= r_2\mu_1 + f_2(2)\left(\frac{1}{1-\tilde{\mu}_2}\right)\mu_1 + f_2(1) \\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= r_2\tilde{\mu}_2 \\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= r_2\hat{\mu}_1 + f_2(2)\left(\frac{1}{1-\tilde{\mu}_2}\right)\hat{\mu}_1 + \hat{F}^{(1)}_{2,1}(1) \\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= r_2\hat{\mu}_2 + f_2(2)\left(\frac{1}{1-\tilde{\mu}_2}\right)\hat{\mu}_2 + \hat{F}^{(1)}_{2,2}(1) \\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_1\mu_1 + \hat{f}_1(1)\left(\frac{1}{1-\hat{\mu}_1}\right)\mu_1 + F^{(1)}_{1,1}(1) \\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_1\mu_2 + \hat{f}_1(1)\left(\frac{1}{1-\hat{\mu}_1}\right)\tilde{\mu}_2 + F^{(1)}_{2,1}(1) \\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_1\hat{\mu}_1 \\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_1\hat{\mu}_2 + \hat{f}_1(1)\left(\frac{1}{1-\hat{\mu}_1}\right)\hat{\mu}_2 + \hat{f}_1(2) \\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_2\mu_1 + \hat{f}_2(1)\left(\frac{1}{1-\hat{\mu}_2}\right)\mu_1 + F^{(1)}_{1,2}(1) \\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_2\tilde{\mu}_2 + \hat{f}_2(2)\left(\frac{1}{1-\hat{\mu}_2}\right)\tilde{\mu}_2 + F^{(1)}_{2,2}(1) \\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_2\hat{\mu}_1 + \hat{f}_2(2)\left(\frac{1}{1-\hat{\mu}_2}\right)\hat{\mu}_1 + \hat{f}_2(1) \\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_2\hat{\mu}_2
\end{aligned}
$$

Es decir, se tienen las siguientes ecuaciones:

$$
\begin{aligned}
f_2(1) &= r_1\mu_1 \\
f_1(2) &= r_2\tilde{\mu}_2 \\
f_2(2) &= r_1\tilde{\mu}_2 + \tilde{\mu}_2\left(\frac{f_1(1)}{1-\mu_1}\right) + f_1(2) = \left(r_1 + \frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2 + r_2\tilde{\mu}_2 \\
&= \left(r_1 + r_2 + \frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2 = \left(r + \frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2 \\
f_2(3) &= r_1\hat{\mu}_1 + \hat{\mu}_1\left(\frac{f_1(1)}{1-\mu_1}\right) + \hat{F}^{(1)}_{1,1}(1) = \hat{\mu}_1\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_1}{\mu_1} \\
f_2(4) &= r_1\hat{\mu}_2 + \hat{\mu}_2\left(\frac{f_1(1)}{1-\mu_1}\right) + \hat{F}^{(1)}_{2,1}(1) = \hat{\mu}_2\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_2}{\mu_1} \\
f_1(1) &= r_2\mu_1 + \mu_1\left(\frac{f_2(2)}{1-\tilde{\mu}_2}\right) + r_1\mu_1 = \mu_1\left(r_1 + r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) \\
&= \mu_1\left(r + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) \\
f_1(3) &= r_2\hat{\mu}_1 + \hat{\mu}_1\left(\frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \hat{F}^{(1)}_{1,2}(1) = \hat{\mu}_1\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_1}{\mu_2} \\
f_1(4) &= r_2\hat{\mu}_2 + \hat{\mu}_2\left(\frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \hat{F}^{(1)}_{2,2}(1) = \hat{\mu}_2\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_2}{\mu_2} \\
\hat{f}_1(4) &= \hat{r}_2\hat{\mu}_2 \\
\hat{f}_2(3) &= \hat{r}_1\hat{\mu}_1 \\
\hat{f}_1(1) &= \hat{r}_2\mu_1 + \mu_1\left(\frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right) + F^{(1)}_{1,2}(1) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\mu_1 + \frac{\mu_1}{\hat{\mu}_2} \\
\hat{f}_1(2) &= \hat{r}_2\tilde{\mu}_2 + \tilde{\mu}_2\left(\frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right) + F^{(1)}_{2,2}(1) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\tilde{\mu}_2 + \frac{\mu_2}{\hat{\mu}_2} \\
\hat{f}_1(3) &= \hat{r}_2\hat{\mu}_1 + \hat{\mu}_1\left(\frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right) + \hat{f}_2(3) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 + \hat{r}_1\hat{\mu}_1 \\
&= \left(\hat{r}_1 + \hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 = \left(\hat{r} + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 \\
\hat{f}_2(1) &= \hat{r}_1\mu_1 + \mu_1\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + F^{(1)}_{1,1}(1) = \left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\mu_1 + \frac{\mu_1}{\hat{\mu}_1} \\
\hat{f}_2(2) &= \hat{r}_1\tilde{\mu}_2 + \tilde{\mu}_2\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + F^{(1)}_{2,1}(1) = \left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\tilde{\mu}_2 + \frac{\mu_2}{\hat{\mu}_1} \\
\hat{f}_2(4) &= \hat{r}_1\hat{\mu}_2 + \hat{\mu}_2\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + \hat{f}_1(4) = \hat{r}_1\hat{\mu}_2 + \hat{r}_2\hat{\mu}_2 + \hat{\mu}_2\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) \\
&= \left(\hat{r} + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\hat{\mu}_2
\end{aligned}
$$

es decir,

$$
\begin{array}{lll}
f_1(1) = \mu_1\left(r + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) & f_1(2) = r_2\tilde{\mu}_2 & f_1(3) = \hat{\mu}_1\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_1}{\mu_2} \\
f_1(4) = \hat{\mu}_2\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_2}{\mu_2} & f_2(1) = r_1\mu_1 & f_2(2) = \left(r + \frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2 \\
f_2(3) = \hat{\mu}_1\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_1}{\mu_1} & f_2(4) = \hat{\mu}_2\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_2}{\mu_1} & \hat{f}_1(1) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\mu_1 + \frac{\mu_1}{\hat{\mu}_2} \\
\hat{f}_1(2) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\tilde{\mu}_2 + \frac{\mu_2}{\hat{\mu}_2} & \hat{f}_1(3) = \left(\hat{r} + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 & \hat{f}_1(4) = \hat{r}_2\hat{\mu}_2 \\
\hat{f}_2(1) = \left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\mu_1 + \frac{\mu_1}{\hat{\mu}_1} & \hat{f}_2(2) = \left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\tilde{\mu}_2 + \frac{\mu_2}{\hat{\mu}_1} & \hat{f}_2(3) = \hat{r}_1\hat{\mu}_1 \\
 & \hat{f}_2(4) = \left(\hat{r} + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\hat{\mu}_2 &
\end{array}
$$

36.46.4. Solución del Sistema de Ecuaciones Lineales

A saber, se puede demostrar que la solución del sistema de ecuaciones está dado por las siguientes expresiones, donde

$$\mu = \mu_1 + \tilde{\mu}_2 \ , \ \hat{\mu} = \hat{\mu}_1 + \hat{\mu}_2 \ , \ r = r_1 + r_2 \text{ y } \hat{r} = \hat{r}_1 + \hat{r}_2$$

entonces

$$
\begin{array}{lll}
f_1(1) = r\frac{\mu_1(1-\mu_1)}{1-\mu} & f_1(3) = \hat{\mu}_1\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right) & f_1(4) = \hat{\mu}_2\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right) \\
f_2(2) = r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu} & f_2(3) = \hat{\mu}_1\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right) & f_2(4) = \hat{\mu}_2\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right) \\
\hat{f}_1(1) = \mu_1\left(\frac{\hat{r}_2\hat{\mu}_2+1}{\hat{\mu}_2} + \hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right) & \hat{f}_1(2) = \tilde{\mu}_2\left(\hat{r}_2 + \hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right) + \frac{\mu_2}{\hat{\mu}_2} & \hat{f}_1(3) = \hat{r}\frac{\hat{\mu}_1(1-\hat{\mu}_1)}{1-\hat{\mu}} \\
\hat{f}_2(1) = \mu_1\left(\frac{\hat{r}_1\hat{\mu}_1+1}{\hat{\mu}_1} + \hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right) & \hat{f}_2(2) = \tilde{\mu}_2\left(\hat{r}_1 + \hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right) + \frac{\mu_2}{\hat{\mu}_1} & \hat{f}_2(4) = \hat{r}\frac{\hat{\mu}_2(1-\hat{\mu}_2)}{1-\hat{\mu}}
\end{array}
$$

A saber

$$
\begin{aligned}
f_1(3) &= \hat{\mu}_1\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_1}{\mu_2} = \hat{\mu}_1\left(r_2 + \frac{r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu}}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_1}{\mu_2} = \hat{\mu}_1\left(r_2 + \frac{r\tilde{\mu}_2}{1-\mu}\right) + \frac{\hat{\mu}_1}{\mu_2} \\
&= \hat{\mu}_1\left(r_2 + \frac{r\tilde{\mu}_2}{1-\mu} + \frac{1}{\mu_2}\right) = \hat{\mu}_1\left(\frac{r_2\mu_2+1}{\mu_2} + \frac{r\tilde{\mu}_2}{1-\mu}\right)
\end{aligned}
$$

$$
\begin{aligned}
f_1(4) &= \hat{\mu}_2\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_2}{\mu_2} = \hat{\mu}_2\left(r_2 + \frac{r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu}}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_2}{\mu_2} = \hat{\mu}_2\left(r_2 + \frac{r\tilde{\mu}_2}{1-\mu}\right) + \frac{\hat{\mu}_1}{\mu_2} \\
&= \hat{\mu}_2\left(r_2 + \frac{r\tilde{\mu}_2}{1-\mu} + \frac{1}{\mu_2}\right) = \hat{\mu}_2\left(\frac{r_2\mu_2+1}{\mu_2} + \frac{r\tilde{\mu}_2}{1-\mu}\right)
\end{aligned}
$$

$$
\begin{aligned}
f_2(3) &= \hat{\mu}_1\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_1}{\mu_1} = \hat{\mu}_1\left(r_1 + \frac{r\frac{\mu_1(1-\mu_1)}{1-\mu}}{1-\mu_1}\right) + \frac{\hat{\mu}_1}{\mu_1} = \hat{\mu}_1\left(r_1 + \frac{r\mu_1}{1-\mu}\right) + \frac{\hat{\mu}_1}{\mu_1} \\
&= \hat{\mu}_1\left(r_1 + \frac{r\mu_1}{1-\mu} + \frac{1}{\mu_1}\right) = \hat{\mu}_1\left(\frac{r_1\mu_1+1}{\mu_1} + \frac{r\mu_1}{1-\mu}\right)
\end{aligned}
$$

$$
\begin{aligned}
f_2(4) &= \hat{\mu}_2\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_2}{\mu_1} = \hat{\mu}_2\left(r_1 + \frac{r\frac{\mu_1(1-\mu_1)}{1-\mu}}{1-\mu_1}\right) + \frac{\hat{\mu}_1}{\mu_1} = \hat{\mu}_2\left(r_1 + \frac{r\mu_1}{1-\mu}\right) + \frac{\hat{\mu}_1}{\mu_1} \\
&= \hat{\mu}_2\left(r_1 + \frac{r\mu_1}{1-\mu} + \frac{1}{\mu_1}\right) = \hat{\mu}_2\left(\frac{r_1\mu_1+1}{\mu_1} + \frac{r\mu_1}{1-\mu}\right)
\end{aligned}
$$

$$
\begin{aligned}
\hat{f}_1(1) &= \mu_1\left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\tilde{\mu}_2}\right) + \frac{\mu_1}{\hat{\mu}_2} = \mu_1\left(\hat{r}_2 + \frac{\hat{r}\frac{\hat{\mu}_2(1-\hat{\mu}_2)}{1-\hat{\mu}}}{1-\hat{\mu}_2}\right) + \frac{\mu_1}{\hat{\mu}_2} = \mu_1\left(\hat{r}_2 + \frac{\hat{r}\hat{\mu}_2}{1-\hat{\mu}}\right) + \frac{\mu_1}{\mu_2} \\
&= \mu_1\left(\hat{r}_2 + \frac{\hat{r}\mu_2}{1-\hat{\mu}} + \frac{1}{\hat{\mu}_2}\right) = \mu_1\left(\frac{\hat{r}_2\hat{\mu}_2+1}{\hat{\mu}_2} + \frac{\hat{r}\hat{\mu}_2}{1-\hat{\mu}}\right)
\end{aligned}
$$

$$
\hat{f}_1(2) = \tilde{\mu}_2\left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\tilde{\mu}_2}\right) + \frac{\mu_2}{\hat{\mu}_2} = \tilde{\mu}_2\left(\hat{r}_2 + \frac{\hat{r}\frac{\hat{\mu}_2(1-\hat{\mu}_2)}{1-\hat{\mu}}}{1-\hat{\mu}_2}\right) + \frac{\mu_2}{\hat{\mu}_2} = \tilde{\mu}_2\left(\hat{r}_2 + \frac{\hat{r}\hat{\mu}_2}{1-\hat{\mu}}\right) + \frac{\mu_2}{\hat{\mu}_2}
$$

$$
\begin{aligned}
\hat{f}_2(1) &= \mu_1\left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + \frac{\mu_1}{\hat{\mu}_1} = \mu_1\left(\hat{r}_1 + \frac{\hat{r}\frac{\hat{\mu}_1(1-\hat{\mu}_1)}{1-\hat{\mu}}}{1-\hat{\mu}_1}\right) + \frac{\mu_1}{\hat{\mu}_1} = \mu_1\left(\hat{r}_1 + \frac{\hat{r}\hat{\mu}_1}{1-\hat{\mu}}\right) + \frac{\mu_1}{\hat{\mu}_1} \\
&= \mu_1\left(\hat{r}_1 + \frac{\hat{r}\hat{\mu}_1}{1-\hat{\mu}} + \frac{1}{\hat{\mu}_1}\right) = \mu_1\left(\frac{\hat{r}_1\hat{\mu}_1+1}{\hat{\mu}_1} + \frac{\hat{r}\hat{\mu}_1}{1-\hat{\mu}}\right)
\end{aligned}
$$

$$
\hat{f}_2(2) = \tilde{\mu}_2\left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\tilde{\mu}_1}\right) + \frac{\mu_2}{\hat{\mu}_1} = \tilde{\mu}_2\left(\hat{r}_1 + \frac{\hat{r}\frac{\hat{\mu}_1(1-\hat{\mu}_1)}{1-\hat{\mu}}}{1-\hat{\mu}_1}\right) + \frac{\mu_2}{\hat{\mu}_1} = \tilde{\mu}_2\left(\hat{r}_1 + \frac{\hat{r}\hat{\mu}_1}{1-\hat{\mu}}\right) + \frac{\mu_2}{\hat{\mu}_1}
$$

36.47. Resultado Principal

Sean $\mu_1, \mu_2, \breve{\mu}_2, \hat{\mu}_1, \hat{\mu}_2$ y $\tilde{\mu}_2 = \mu_2 + \breve{\mu}_2$ los valores esperados de los proceso definidos anteriormente, y sean $r_1, r_2, \hat{r}_1$ y $\hat{r}_2$ los valores esperado s de los tiempos de traslado del servidor entre las colas para cada uno de los sistemas de visitas cíclicas. Si se definen $\mu = \mu_1 + \tilde{\mu}_2$, $\hat{\mu} = \hat{\mu}_1 + \hat{\mu}_2$, y $r = r_1 + r_2$ y $\hat{r} = \hat{r}_1 + \hat{r}_2$, entonces se tiene el siguiente resultado.

Teorema 36.47.1 *Supongamos que $\mu < 1$, $\hat{\mu} < 1$, entonces, el número de usuarios presentes en cada una de las colas que conforman la Red de Sistemas de Visitas Cíclicas cuando uno de los servidores visita a alguna de ellas está dada por la solución del Sistema de Ecuaciones Lineales presentados arriba cuyas expresiones damos a continuación:*

$$\begin{array}{lll}
f_1(1) = r\frac{\mu_1(1-\mu_1)}{1-\mu}, & f_1(2) = r_2\tilde{\mu}_2, & f_1(3) = \hat{\mu}_1\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right), \\
f_1(4) = \hat{\mu}_2\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right), & f_2(1) = r_1\mu_1, & f_2(2) = r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu}, \\
f_2(3) = \hat{\mu}_1\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right), & f_2(4) = \hat{\mu}_2\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right), & \hat{f}_1(1) = \mu_1\left(\frac{\hat{r}_2\hat{\mu}_2+1}{\hat{\mu}_2} + \hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right), \\
\hat{f}_1(2) = \tilde{\mu}_2\left(\hat{r}_2 + \hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right) + \frac{\mu_2}{\hat{\mu}_2}, & \hat{f}_1(3) = \hat{r}\frac{\hat{\mu}_1(1-\hat{\mu}_1)}{1-\hat{\mu}}, & \hat{f}_1(4) = \hat{r}_2\hat{\mu}_2, \\
\hat{f}_2(1) = \mu_1\left(\frac{\hat{r}_1\hat{\mu}_1+1}{\hat{\mu}_1} + \hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right), & \hat{f}_2(2) = \tilde{\mu}_2\left(\hat{r}_1 + \hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right) + \frac{\hat{\mu}_2}{\hat{\mu}_1}, & \hat{f}_2(3) = \hat{r}_1\hat{\mu}_1, \\
 & \hat{f}_2(4) = \hat{r}\frac{\hat{\mu}_2(1-\hat{\mu}_2)}{1-\hat{\mu}}. &
\end{array}$$

36.48. Segundos Momentos

Para poder determinar los segundos momentos para los tiempos de traslado del servidor es necesaria la siguiente proposición:

Proposición 36.48.1 *Sea $f(g(x)h(y))$ función continua tal que tiene derivadas parciales mixtas de segundo orden, entonces se tiene lo siguiente:*

$$\frac{\partial}{\partial x} f(g(x)h(y)) = \frac{\partial f(g(x)h(y))}{\partial x} \cdot \frac{\partial g(x)}{\partial x} \cdot h(y)$$

por tanto

$$\frac{\partial}{\partial x}\frac{\partial}{\partial x} f(g(x)h(y)) = \frac{\partial^2}{\partial x} f(g(x)h(y)) \cdot \left(\frac{\partial g(x)}{\partial x}\right)^2 \cdot h^2(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g^2(x)}{\partial x^2} \cdot h(y) \quad (36.48.1)$$

y

$$\frac{\partial}{\partial y}\frac{\partial}{\partial x} f(g(x)h(y)) = \frac{\partial g(x)}{\partial x} \cdot \frac{\partial h(y)}{\partial y}\left\{\frac{\partial^2}{\partial y \partial x} f(g(x)h(y)) \cdot g(x) \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y))\right\}$$

Demostración 36.48.1

$$\begin{aligned}
\frac{\partial}{\partial x}\frac{\partial}{\partial x} f(g(x)h(y)) &= \frac{\partial}{\partial x}\left\{\frac{\partial f(g(x)h(y))}{\partial x} \cdot \frac{\partial g(x)}{\partial x} \cdot h(y)\right\} \\
&= \frac{\partial}{\partial x}\left\{\frac{\partial}{\partial x} f(g(x)h(y))\right\} \cdot \frac{\partial g(x)}{\partial x} \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g^2(x)}{\partial x^2} \cdot h(y) \\
&= \frac{\partial^2}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g(x)}{\partial x} \cdot h(y) \cdot \frac{\partial g(x)}{\partial x} \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g^2(x)}{\partial x^2} \cdot h(y) \\
&= \frac{\partial^2}{\partial x} f(g(x)h(y)) \cdot \left(\frac{\partial g(x)}{\partial x}\right)^2 \cdot h^2(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g^2(x)}{\partial x^2} \cdot h(y).
\end{aligned}$$

Por otra parte:

$$\begin{aligned}
\frac{\partial}{\partial y}\frac{\partial}{\partial x} f(g(x)h(y)) &= \frac{\partial}{\partial y}\left\{\frac{\partial f(g(x)h(y))}{\partial x} \cdot \frac{\partial g(x)}{\partial x} \cdot h(y)\right\} \\
&= \frac{\partial}{\partial y}\left\{\frac{\partial}{\partial x} f(g(x)h(y))\right\} \cdot \frac{\partial g(x)}{\partial x} \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g(x)}{\partial x} \cdot \frac{\partial h(y)}{y} \\
&= \frac{\partial^2}{\partial y \partial x} f(g(x)h(y)) \cdot \frac{\partial h(y)}{\partial y} \cdot g(x) \cdot \frac{\partial g(x)}{\partial x} \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g(x)}{\partial x} \cdot \frac{\partial h(y)}{\partial y} \\
&= \frac{\partial g(x)}{\partial x} \cdot \frac{\partial h(y)}{\partial y}\left\{\frac{\partial^2}{\partial y \partial x} f(g(x)h(y)) \cdot g(x) \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y))\right\}
\end{aligned}$$

Utilizando la proposición anterior (Proposiciíon 36.85.1)se tiene el siguiente resultado que me dice como calcular los segundos momentos para los procesos de traslado del servidor:

Proposición 36.48.2 *Sea R_i la Función Generadora de Probabilidades para el número de arribos a cada una de las colas de la Red de Sistemas de Visitas Cíclicas definidas como en (36.84.4). Entonces las derivadas parciales están dadas por las siguientes expresiones:*

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_i^2} &= \left(\frac{\partial P_i(z_i)}{\partial z_i}\right)^2\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial^2 z_i}\\ &+ \left(\frac{\partial P_i(z_i)}{\partial z_i}\right)^2\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_i}\end{aligned}$$

y además

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_2\partial z_1} &= \frac{\partial\tilde{P}_2(z_2)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_2\partial z_1}\\ &+ \frac{\partial\tilde{P}_2(z_2)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_1},\end{aligned}$$

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_1} &= \frac{\partial\hat{P}_i(w_i)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_1}\\ &+ \frac{\partial\hat{P}_i(w_i)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_1},\end{aligned}$$

finalmente

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_2} &= \frac{\partial\hat{P}_i(w_i)}{\partial w_i}\cdot\frac{\partial\tilde{P}_2(z_2)}{\partial z_2}\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_2}\\ &+ \frac{\partial\hat{P}_i(w_i)}{\partial w_i}\cdot\frac{\partial\tilde{P}_2(z_2)}{\partial z_1}\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_2},\end{aligned}$$

para $i = 1, 2$.

36.48.1. Sistema de Ecuaciones Lineales para los Segundos Momentos

En el apéndice (36.67) se demuestra que las ecuaciones para las ecuaciones parciales mixtas están dadas por:

$$\begin{aligned}f_1(1,1) &= r_2P_1^{(2)}(1)+\mu_1^2R_2^{(2)}(1)+2\mu_1r_2\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right)+\frac{1}{1-\tilde{\mu}_2}P_1^{(2)}f_2(2)+\mu_1^2\tilde{\theta}_2^{(2)}(1)f_2(2)\\ &+ \frac{\mu_1}{1-\tilde{\mu}_2}f_2(1,2)+\frac{\mu_1}{1-\tilde{\mu}_2}\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2,2)+f_2(1,2)\right)+f_2(1,1),\\ f_1(2,1) &= \mu_1r_2\tilde{\mu}_2+\mu_1\tilde{\mu}_2R_2^{(2)}(1)+r_2\tilde{\mu}_2\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right),\\ f_1(3,1) &= \mu_1\hat{\mu}_1r_2+\mu_1\hat{\mu}_1R_2^{(2)}(1)+r_2\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+r_2\hat{\mu}_1\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right)+\mu_1r_2\hat{F}_{2,1}^{(1)}(1)\\ &+ \left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right)\hat{F}_{2,1}^{(1)}(1)+\frac{\mu_1\hat{\mu}_1}{1-\tilde{\mu}_2}f_2(2)+\mu_1\hat{\mu}_1\tilde{\theta}_2^{(2)}(1)f_2(2)+\mu_1\hat{\mu}_1\left(\frac{1}{1-\tilde{\mu}_2}\right)^2f_2(2,2)\\ &+ +\frac{\hat{\mu}_1}{1-\tilde{\mu}_2}f_2(1,2),\\ f_1(4,1) &= \mu_1\hat{\mu}_2r_2+\mu_1\hat{\mu}_2R_2^{(2)}(1)+r_2\frac{\mu_1\hat{\mu}_2}{1-\tilde{\mu}_2}f_2(2)+\mu_1r_2\hat{F}_{2,2}^{(1)}(1)+r_2\hat{\mu}_2\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right)\\ &+ \hat{F}_{2,1}^{(1)}(1)\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right)+\frac{\mu_1\hat{\mu}_2}{1-\tilde{\mu}_2}f_2(2)+\mu_1\hat{\mu}_2\tilde{\theta}_2^{(2)}(1)f_2(2)+\mu_1\hat{\mu}_2\left(\frac{1}{1-\tilde{\mu}_2}\right)^2f_2(2,2)\\ &+ \frac{\hat{\mu}_2}{1-\tilde{\mu}_2}f_2^{(1,2)},\end{aligned}$$

$$

36.49. Medidas de Desempeño

Definición 36.49.1 *Sea L_i^* el número de usuarios cuando el servidor visita la cola Q_i para dar servicio, para $i = 1, 2$.*

Entonces

Proposición 36.49.1 *Para la cola Q_i, $i = 1, 2$, se tiene que el número de usuarios presentes al momento de ser visitada por el servidor está dado por*

$$\mathbb{E}[L_i^*] = f_i(i) \tag{36.49.1}$$

$$Var[L_i^*] = f_i(i,i) + \mathbb{E}[L_i^*] - \mathbb{E}[L_i^*]^2. \tag{36.49.2}$$

Definición 36.49.2 *El tiempo de Ciclo C_i es el periodo de tiempo que comienza cuando la cola i es visitada por primera vez en un ciclo, y termina cuando es visitado nuevamente en el próximo ciclo, bajo condiciones de estabilidad.*

$$C_i(z) = \mathbb{E}\left[z^{\overline{\tau}_i(m+1) - \overline{\tau}_i(m)}\right]$$

Definición 36.49.3 *El tiempo de intervisita I_i es el periodo de tiempo que comienza cuando se ha completado el servicio en un ciclo y termina cuando es visitada nuevamente en el próximo ciclo.*

$$I_i(z) = \mathbb{E}\left[z^{\tau_i(m+1)-\overline{\tau}_i(m)}\right]$$

Proposición 36.49.2 *Para los tiempos de intervisita del servidor I_i, se tiene que*

$$\begin{aligned}
\mathbb{E}[I_i] &= \frac{f_i(i)}{\mu_i}, \\
Var[I_i] &= \frac{Var\left[L_i^*\right]}{\mu_i^2} - \frac{\sigma_i^2}{\mu_i^2} f_i(i).
\end{aligned}$$

Proposición 36.49.3 *Para los tiempos que ocupa el servidor para atender a los usuarios presentes en la cola Q_i, con FGP denotada por S_i, se tiene que*

$$\begin{aligned}
\mathbb{E}[S_i] &= \frac{\mathbb{E}\left[L_i^*\right]}{1-\mu_i} = \frac{f_i(i)}{1-\mu_i}, \\
Var[S_i] &= \frac{Var\left[L_i^*\right]}{(1-\mu_i)^2} + \frac{\sigma^2 \mathbb{E}\left[L_i^*\right]}{(1-\mu_i)^3}
\end{aligned}$$

Proposición 36.49.4 *Para la duración de los ciclos C_i se tiene que*

$$\begin{aligned}
\mathbb{E}[C_i] &= \mathbb{E}[I_i]\,\mathbb{E}[\theta_i(z)] = \frac{\mathbb{E}\left[L_i^*\right]}{\mu_i}\frac{1}{1-\mu_i} = \frac{f_i(i)}{\mu_i(1-\mu_i)} \\
Var[C_i] &= \frac{Var\left[L_i^*\right]}{\mu_i^2(1-\mu_i)^2}.
\end{aligned}$$

=\;& \hat{r}_1\tilde{\mu}_2\hat{\mu}_2+\tilde{\mu}_2\hat{\mu}_2\hat{R}_1^{(2)}(1)+\hat{r}_1\hat{\mu}_2F_1^{(0,1)}+\hat{r}_1\frac{\tilde{\mu}_2\hat{\mu}_2}{1-\hat{\mu}_1}\hat{F}_1^{(1,0)}+\hat{r}_1\tilde{\mu}_2\left(\hat{F}_1^{(0,1)}+\frac{\hat{\mu}_2}{1-\hat{\mu}_1}\hat{F}_1^{(1,0)}\right)\\
+\;& F_1^{(0,1)}\left(\hat{F}_1^{(0,1)}+\frac{\hat{\mu}_2}{1-\hat{\mu}_1}\hat{F}_1^{(1,0)}\right)+\frac{\tilde{\mu}_2\hat{\mu}_2}{1-\hat{\mu}_1}\hat{F}_1^{(1,0)}+\tilde{\mu}_2\hat{\mu}_2\hat{\theta}_1^{(2)}(1)\hat{F}_1^{(1,0)}+\frac{\tilde{\mu}_2}{1-\hat{\mu}_1}\hat{F}_1^{(1,1)}\\
+\;& \tilde{\mu}_2\hat{\mu}_2\left(\frac{1}{1-\hat{\mu}_1}\right)^2\hat{F}_1^{(2,0)}.
\end{aligned}$$

15.

$$\begin{aligned}
&\frac{\partial}{\partial w_1}\frac{\partial}{\partial w_2}\left(\hat{R}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)\hat{F}_1\left(\hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right),w_2\right)F_1(z_1,z_2)\right)\\
=\;& \hat{r}_1\hat{\mu}_2\hat{\mu}_1+\hat{\mu}_2\hat{\mu}_1\hat{R}_1^{(2)}(1)+\hat{r}_1\hat{\mu}_1\left(\hat{F}_1^{(0,1)}+\frac{\hat{\mu}_2}{1-\hat{\mu}_1}\hat{F}_1^{(1,0)}\right).
\end{aligned}$$

16.

$$\begin{aligned}
&\frac{\partial}{\partial w_2}\frac{\partial}{\partial w_2}\left(\hat{R}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)\hat{F}_1\left(\hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right),w_2\right)F_1(z_1,z_2)\right)\\
=\;& \hat{r}_1\hat{P}_2^{(2)}(1)+\hat{\mu}_2^2\hat{R}_1^{(2)}(1)+2\hat{r}_1\hat{\mu}_2\left(\hat{F}_1^{(0,1)}+\frac{\hat{\mu}_2}{1-\hat{\mu}_1}\hat{F}_1^{(1,0)}\right)+\hat{F}_1^{(0,2)}+\frac{1}{1-\hat{\mu}_1}\hat{P}_2^{(2)}(1)\hat{F}_1^{(1,0)}\\
+\;& \hat{\mu}_2^2\hat{\theta}_1^{(2)}(1)\hat{F}_1^{(1,0)}+\frac{\hat{\mu}_2}{1-\hat{\mu}_1}\hat{F}_1^{(1,1)}+\frac{\hat{\mu}_2}{1-\hat{\mu}_1}\left(\hat{F}_1^{(1,1)}+\frac{\hat{\mu}_2}{1-\hat{\mu}_1}\hat{F}_1^{(2,0)}\right).
\end{aligned}$$

Las ecuaciones que determinan los segundos momentos de las longitudes de las colas de los dos sistemas se pueden ver en este sitio

Apéndice B

Distribución para los usuarios de traslado

Se puede demostrar que

$$\frac{d^k}{dy}\left(\frac{\lambda+\mu}{\lambda+\mu-y}\right)=\frac{k!}{(\lambda+\mu)^k} \tag{36.49.3}$$

Proposición 36.49.5 *Sea τ variable aleatoria no negativa con distribución exponencial con media μ, y sea $L(t)$ proceso Poisson con parámetro λ. Entonces*

$$\mathbb{P}\{L(\tau)=k\}=f_{L(\tau)}(k)=\left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)^{k}. \tag{36.49.4}$$

Además

$$\mathbb{E}[L(\tau)] = \frac{\lambda}{\mu} \tag{36.49.5}$$

$$\mathbb{E}\left[(L(\tau))^2\right] = \frac{\lambda}{\mu}\left(2\frac{\lambda}{\mu}+1\right) \tag{36.49.6}$$

$$V[L(\tau)] = \frac{\lambda}{\mu}\left(\frac{\lambda}{\mu}+1\right). \tag{36.49.7}$$

A saber, para k fijo se tiene que

$$\begin{aligned}
\mathbb{P}\{L(\tau)=k\} &= \mathbb{P}\{L(\tau)=k,\tau\in(0,\infty)\}\\
&= \int_0^\infty \mathbb{P}\{L(\tau)=k,\tau=y\}f_\tau(y)\,dy=\int_0^\infty \mathbb{P}\{L(y)=k\}f_\tau(y)\,dy\\
&= \int_0^\infty \frac{e^{-\lambda y}}{k!}(\lambda y)^k\left(\mu e^{-\mu y}\right)dy=\frac{\lambda^k\mu}{k!}\int_0^\infty y^k e^{-(\mu+\lambda)y}dy\\
&= \frac{\lambda^k\mu}{(\lambda+\mu)\,k!}\int_0^\infty y^k(\lambda+\mu)\,e^{-(\lambda+\mu)y}dy=\frac{\lambda^k\mu}{(\lambda+\mu)\,k!}\int_0^\infty y^k f_Y(y)\,dy\\
&= \frac{\lambda^k\mu}{(\lambda+\mu)\,k!}\mathbb{E}\left[Y^k\right]=\frac{\lambda^k\mu}{(\lambda+\mu)\,k!}\frac{d^k}{dy}\left(\frac{\lambda+\mu}{\lambda+\mu-y}\right)|_{y=0}\\
&= \frac{\lambda^k\mu}{(\lambda+\mu)\,k!}\frac{k!}{(\lambda+\mu)^k}=\left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)^k.
\end{aligned}$$

Además

$$\begin{aligned}
\sum_{k=0}^\infty \mathbb{P}\{L(\tau)=k\} &= \sum_{k=0}^\infty\left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)^k=\frac{\mu}{\lambda+\mu}\sum_{k=0}^\infty\left(\frac{\lambda}{\lambda+\mu}\right)^k\\
&= \frac{\mu}{\lambda+\mu}\left(\frac{1}{1-\frac{\lambda}{\lambda+\mu}}\right)=\frac{\mu}{\lambda+\mu}\left(\frac{\lambda+\mu}{\mu}\right)\\
&= 1.
\end{aligned}$$

determinemos primero la esperanza de $L(\tau)$:

$$\begin{aligned}
\mathbb{E}[L(\tau)] &= \sum_{k=0}^\infty k\mathbb{P}\{L(\tau)=k\}=\sum_{k=0}^\infty k\left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)^k\\
&= \left(\frac{\mu}{\lambda+\mu}\right)\sum_{k=0}^\infty k\left(\frac{\lambda}{\lambda+\mu}\right)^k=\left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)\sum_{k=1}^\infty k\left(\frac{\lambda}{\lambda+\mu}\right)^{k-1}\\
&= \frac{\mu\lambda}{(\lambda+\mu)^2}\left(\frac{1}{1-\frac{\lambda}{\lambda+\mu}}\right)^2=\frac{\mu\lambda}{(\lambda+\mu)^2}\left(\frac{\lambda+\mu}{\mu}\right)^2\\
&= \frac{\lambda}{\mu}.
\end{aligned}$$

Ahora su segundo momento:

$$\begin{aligned}
\mathbb{E}\left[(L(\tau))^2\right] &= \sum_{k=0}^{\infty} k^2 \mathbb{P}\{L(\tau)=k\} = \sum_{k=0}^{\infty} k^2 \left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)^k \\
&= \left(\frac{\mu}{\lambda+\mu}\right)\sum_{k=0}^{\infty} k^2 \left(\frac{\lambda}{\lambda+\mu}\right)^k = \frac{\mu\lambda}{(\lambda+\mu)^2}\sum_{k=2}^{\infty}(k-1)^2\left(\frac{\lambda}{\lambda+\mu}\right)^{k-2} \\
&= \frac{\mu\lambda}{(\lambda+\mu)^2}\left(\frac{\frac{\lambda}{\lambda+\mu}+1}{\left(\frac{\lambda}{\lambda+\mu}-1\right)^3}\right) = \frac{\mu\lambda}{(\lambda+\mu)^2}\left(-\frac{\frac{2\lambda+\mu}{\lambda+\mu}}{\left(-\frac{\mu}{\lambda+\mu}\right)^3}\right) \\
&= \frac{\mu\lambda}{(\lambda+\mu)^2}\left(\frac{2\lambda+\mu}{\lambda+\mu}\right)\left(\frac{\lambda+\mu}{\mu}\right)^3 = \frac{\lambda(2\lambda+\mu)}{\mu^2} \\
&= \frac{\lambda}{\mu}\left(2\frac{\lambda}{\mu}+1\right).
\end{aligned}$$

y por tanto

$$\begin{aligned}
V[L(\tau)] &= \frac{\lambda(2\lambda+\mu)}{\mu^2} - \left(\frac{\lambda}{\mu}\right)^2 = \frac{\lambda^2+\mu\lambda}{\mu^2} \\
&= \frac{\lambda}{\mu}\left(\frac{\lambda}{\mu}+1\right).
\end{aligned}$$

Ahora, determinemos la distribución del número de usuarios que pasan de $\hat{Q}_2$ a Q_2 considerando dos políticas de traslado en específico:

1. Solamente pasa un usuario,
2. Se permite el paso de k usuarios,

una vez que son atendidos por el servidor en $\hat{Q}_2$.

Política de un solo usuario: Sea R_2 el número de usuarios que llegan a $\hat{Q}_2$ al tiempo t, sea R_1 el número de usuarios que pasan de $\hat{Q}_2$ a Q_2 al tiempo t.

A saber:

$$\begin{aligned}
\mathbb{E}[R_1] &= \sum_{y\geq 0}\mathbb{P}[R_2=y]\,\mathbb{E}[R_1|R_2=y] \\
&= \sum_{y\geq 0}\mathbb{P}[R_2=y]\sum_{x\geq 0} x\mathbb{P}[R_1=x|R_2=y] \\
&= \sum_{y\geq 0}\sum_{x\geq 0} x\mathbb{P}[R_1=x|R_2=y]\,\mathbb{P}[R_2=y].
\end{aligned}$$

Determinemos

$$\mathbb{E}[R_1|R_2=y] = \sum_{x\geq 0} x\mathbb{P}[R_1=x|R_2=y]. \tag{36.49.8}$$

supongamos que $y=0$, entonces

$$\begin{aligned}
\mathbb{P}[R_1=0|R_2=0] &= 1, \\
\mathbb{P}[R_1=x|R_2=0] &= 0, \text{ para cualquier } x\geq 1,
\end{aligned}$$

por tanto

$$\mathbb{E}[R_1|R_2=0]=0.$$

Para $y=1$,

$$\begin{aligned}
\mathbb{P}[R_1=0|R_2=1] &= 0, \\
\mathbb{P}[R_1=1|R_2=1] &= 1,
\end{aligned}$$

entonces

$$\mathbb{E}[R_1|R_2=1]=1.$$

Para $y > 1$:

$$\begin{aligned}
\mathbb{P}\left[R_1 = 0 | R_2 \geq 1\right] &= 0, \\
\mathbb{P}\left[R_1 = 1 | R_2 \geq 1\right] &= 1, \\
\mathbb{P}\left[R_1 > 1 | R_2 \geq 1\right] &= 0,
\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1 | R_2 = y\right] = 1, \text{ para cualquier } y > 1.$$

es decir

$$\mathbb{E}\left[R_1 | R_2 = y\right] = 1, \text{ para cualquier } y \geq 1.$$

Entonces

$$\begin{aligned}
\mathbb{E}\left[R_1\right] &= \sum_{y \geq 0} \sum_{x \geq 0} x \mathbb{P}\left[R_1 = x | R_2 = y\right] \mathbb{P}\left[R_2 = y\right] = \sum_{y \geq 0} \sum_{x} \mathbb{E}\left[R_1 | R_2 = y\right] \mathbb{P}\left[R_2 = y\right] \\
&= \sum_{y \geq 0} \mathbb{P}\left[R_2 = y\right] = \sum_{y \geq 1} \frac{(\lambda t)^k}{k!} e^{-\lambda t} = 1.
\end{aligned}$$

Además para $k \in Z^+$

$$\begin{aligned}
f_{R_1}(k) &= \mathbb{P}\left[R_1 = k\right] = \sum_{n=0}^{\infty} \mathbb{P}\left[R_1 = k | R_2 = n\right] \mathbb{P}\left[R_2 = n\right] \\
&= \mathbb{P}\left[R_1 = k | R_2 = 0\right] \mathbb{P}\left[R_2 = 0\right] + \mathbb{P}\left[R_1 = k | R_2 = 1\right] \mathbb{P}\left[R_2 = 1\right] \\
&+ \mathbb{P}\left[R_1 = k | R_2 > 1\right] \mathbb{P}\left[R_2 > 1\right],
\end{aligned}$$

donde para

$k = 0$**:**

$$\begin{aligned}
\mathbb{P}\left[R_1 = 0\right] = \mathbb{P}\left[R_1 = 0 | R_2 = 0\right] \mathbb{P}\left[R_2 = 0\right] + \mathbb{P}\left[R_1 = 0 | R_2 = 1\right] \mathbb{P}\left[R_2 = 1\right] \\
+ \mathbb{P}\left[R_1 = 0 | R_2 > 1\right] \mathbb{P}\left[R_2 > 1\right] = \mathbb{P}\left[R_2 = 0\right].
\end{aligned}$$

$k = 1$**:**

$$\begin{aligned}
\mathbb{P}\left[R_1 = 1\right] = \mathbb{P}\left[R_1 = 1 | R_2 = 0\right] \mathbb{P}\left[R_2 = 0\right] + \mathbb{P}\left[R_1 = 1 | R_2 = 1\right] \mathbb{P}\left[R_2 = 1\right] \\
+ \mathbb{P}\left[R_1 = 1 | R_2 > 1\right] \mathbb{P}\left[R_2 > 1\right] = \sum_{n=1}^{\infty} \mathbb{P}\left[R_2 = n\right].
\end{aligned}$$

$k = 2$**:**

$$\begin{aligned}
\mathbb{P}\left[R_1 = 2\right] = \mathbb{P}\left[R_1 = 2 | R_2 = 0\right] \mathbb{P}\left[R_2 = 0\right] + \mathbb{P}\left[R_1 = 2 | R_2 = 1\right] \mathbb{P}\left[R_2 = 1\right] \\
+ \mathbb{P}\left[R_1 = 2 | R_2 > 1\right] \mathbb{P}\left[R_2 > 1\right] = 0.
\end{aligned}$$

$k = j$**:**

$$\begin{aligned}
\mathbb{P}\left[R_1 = j\right] = \mathbb{P}\left[R_1 = j | R_2 = 0\right] \mathbb{P}\left[R_2 = 0\right] + \mathbb{P}\left[R_1 = j | R_2 = 1\right] \mathbb{P}\left[R_2 = 1\right] \\
+ \mathbb{P}\left[R_1 = j | R_2 > 1\right] \mathbb{P}\left[R_2 > 1\right] = 0.
\end{aligned}$$

Por lo tanto

$$\begin{aligned}
f_{R_1}(0) &= \mathbb{P}\left[R_2 = 0\right] \\
f_{R_1}(1) &= \sum_{n \geq 1}^{\infty} \mathbb{P}\left[R_2 = n\right] \\
f_{R_1}(j) &= 0, \text{ para } j > 1.
\end{aligned}$$

Política de k usuarios: Al igual que antes, para $y \in Z^+$ fijo

$$\mathbb{E}\left[R_1 | R_2 = y\right] = \sum_{x} x \mathbb{P}\left[R_1 = x | R_2 = y\right].$$

Entonces, si tomamos diversos valore para y:

$y = 0$:

$$\begin{aligned}
\mathbb{P}\left[R_1 = 0 | R_2 = 0\right] &= 1, \\
\mathbb{P}\left[R_1 = x | R_2 = 0\right] &= 0, \text{ para cualquier } x \geq 1,
\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=0\right]=0.$$

Para $y=1$,

$$\begin{aligned}\mathbb{P}\left[R_1=0|R_2=1\right] &= 0,\\ \mathbb{P}\left[R_1=1|R_2=1\right] &= 1,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=1\right]=1.$$

Para $y=2$,

$$\begin{aligned}\mathbb{P}\left[R_1=0|R_2=2\right] &= 0,\\ \mathbb{P}\left[R_1=1|R_2=2\right] &= 1,\\ \mathbb{P}\left[R_1=2|R_2=2\right] &= 1,\\ \mathbb{P}\left[R_1=3|R_2=2\right] &= 0,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=2\right]=3.$$

Para $y=3$,

$$\begin{aligned}\mathbb{P}\left[R_1=0|R_2=3\right] &= 0,\\ \mathbb{P}\left[R_1=1|R_2=3\right] &= 1,\\ \mathbb{P}\left[R_1=2|R_2=3\right] &= 1,\\ \mathbb{P}\left[R_1=3|R_2=3\right] &= 1,\\ \mathbb{P}\left[R_1=4|R_2=3\right] &= 0,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=3\right]=6.$$

En general, para $k\geq 0$,

$$\begin{aligned}\mathbb{P}\left[R_1=0|R_2=k\right] &= 0,\\ \mathbb{P}\left[R_1=j|R_2=k\right] &= 1,\ \text{para } 1\leq j\leq k,\\ \mathbb{P}\left[R_1=j|R_2=k\right] &= 0,\ \text{para } j>k,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=k\right]=\frac{k\left(k+1\right)}{2}.$$

Por lo tanto

$$\begin{aligned}\mathbb{E}\left[R_1\right] &= \sum_{y}\mathbb{E}\left[R_1|R_2=y\right]\mathbb{P}\left[R_2=y\right]\\ &= \sum_{y}\mathbb{P}\left[R_2=y\right]\frac{y\left(y+1\right)}{2}=\sum_{y\geq 1}\left(\frac{y\left(y+1\right)}{2}\right)\frac{\left(\lambda t\right)^{y}}{y!}e^{-\lambda t}\\ &= \frac{\lambda t}{2}e^{-\lambda t}\sum_{y\geq 1}\left(y+1\right)\frac{\left(\lambda t\right)^{y-1}}{\left(y-1\right)!}=\frac{\lambda t}{2}e^{-\lambda t}\left(e^{\lambda t}\left(\lambda t+2\right)\right)\\ &= \frac{\lambda t\left(\lambda t+2\right)}{2},\end{aligned}$$

es decir,

$$\mathbb{E}\left[R_1\right]=\frac{\lambda t\left(\lambda t+2\right)}{2}. \tag{36.49.9}$$

Además para $k\in Z^{+}$ fijo

$$\begin{aligned}f_{R_1}\left(k\right) &= \mathbb{P}\left[R_1=k\right]=\sum_{n=0}^{\infty}\mathbb{P}\left[R_1=k|R_2=n\right]\mathbb{P}\left[R_2=n\right]\\ &= \mathbb{P}\left[R_1=k|R_2=0\right]\mathbb{P}\left[R_2=0\right]+\mathbb{P}\left[R_1=k|R_2=1\right]\mathbb{P}\left[R_2=1\right]\\ &+ \mathbb{P}\left[R_1=k|R_2=2\right]\mathbb{P}\left[R_2=2\right]+\cdots+\mathbb{P}\left[R_1=k|R_2=j\right]\mathbb{P}\left[R_2=j\right]+\cdots+\end{aligned}$$

donde para

$k = 0$:

$$\begin{aligned}\mathbb{P}[R_1 = 0] = \mathbb{P}[R_1 = 0|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = 0|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = 0|R_2 = j]\,\mathbb{P}[R_2 = j] = \mathbb{P}[R_2 = 0].\end{aligned}$$

$k = 1$:

$$\begin{aligned}\mathbb{P}[R_1 = 1] = \mathbb{P}[R_1 = 1|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = 1|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = 1|R_2 = 1]\,\mathbb{P}[R_2 = 1] + \cdots + \mathbb{P}[R_1 = 1|R_2 = j]\,\mathbb{P}[R_2 = j] \\ = \sum_{n=1}^{\infty} \mathbb{P}[R_2 = n].\end{aligned}$$

$k = 2$:

$$\begin{aligned}\mathbb{P}[R_1 = 2] = \mathbb{P}[R_1 = 2|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = 2|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = 2|R_2 = 2]\,\mathbb{P}[R_2 = 2] + \cdots + \mathbb{P}[R_1 = 2|R_2 = j]\,\mathbb{P}[R_2 = j] \\ = \sum_{n=2}^{\infty} \mathbb{P}[R_2 = n].\end{aligned}$$

En general

$$\begin{aligned}\mathbb{P}[R_1 = k] = \mathbb{P}[R_1 = k|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = k|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = k|R_2 = 2]\,\mathbb{P}[R_2 = 2] + \cdots + \mathbb{P}[R_1 = k|R_2 = k]\,\mathbb{P}[R_2 = k] \\ = \sum_{n=k}^{\infty} \mathbb{P}[R_2 = n].\end{aligned}$$

Por lo tanto

$$f_{R_1}(k) \quad = \quad \mathbb{P}[R_1 = k] = \sum_{n=k}^{\infty} \mathbb{P}[R_2 = n].$$

Objetivos Principales

- Encontrar las ecuaciones que modelan el comportamiento de una Red de Sistemas de Visitas Cíclicas (RSVC) con propiedades similares.
- Encontrar expresiones analíticas para las longitudes de las colas al momento en que el servidor llega a una de ellas para comenzar a dar servicio, así como de sus segundos momentos.
- Determinar las principales medidas de Desempeño para la RSVC tales como: Número de usuarios presentes en cada una de las colas del sistema cuando uno de los servidores está presente atendiendo, Tiempos que transcurre entre las visitas del servidor a la misma cola.

36.50. Descripción de una Red de Sistemas de Visitas Cíclicas

Consideremos una red de sistema de visitas cíclicas conformada por dos sistemas de visitas cíclicas, cada una con dos colas independientes, donde además se permite el intercambio de usuarios entre los dos sistemas en la segunda cola de cada uno de ellos.

Supuestos sobe la Red de Sistemas de Visitas Cíclicas

- Los arribos de los usuarios ocurren conforme a un proceso Poisson con tasa de llegada μ_1 y μ_2 para el sistema 1, mientras que para el sistema 2, lo hacen conforme a un proceso Poisson con tasa $\hat{\mu}_1, \hat{\mu}_2$ respectivamente.
- Se considerarán intervalos de tiempo de la forma $[t, t+1]$. Los usuarios arriban por paquetes de manera independiente del resto de las colas. Se define el grupo de usuarios que llegan a cada una de las colas del sistema 1, caracterizadas por Q_1 y Q_2 respectivamente, en el intervalo de tiempo $[t, t+1]$ por $X_1(t), X_2(t)$.
- Se definen los procesos $\hat{X}_1(t), \hat{X}_2(t)$ para las colas del sistema 2, denotadas por $\hat{Q}_1$ y $\hat{Q}_2$ respectivamente. Donde además se supone que $\mu_i < 1$ y $\hat{\mu} < 1$ para $i = 1, 2$.

- Se define el proceso $Y_2(t)$ para el número de usuarios que se trasladan del sistema 2 al sistema 1, de la cola $\hat{Q}_2$ a la cola Q_2, en el intervalo de tiempo $[t, t+1]$. El traslado de un sistema a otro ocurre de manera que los tiempos entre llegadas de los usuarios a la cola dos del sistema 1 provenientes del sistema 2, se distribuye de manera general con parámetro $\tilde{\mu}_2$, con $\tilde{\mu}_2 < 1$.
- En lo que respecta al servidor, en términos de los tiempos de visita a cada una de las colas, se definen las variables aleatorias τ_i, para Q_i, para $i = 1, 2$, respectivamente; y ζ_i para $\hat{Q}_i$, $i = 1, 2$, del sistema 2 respectivamente. A los tiempos en que el servidor termina de atender en las colas $Q_i, \hat{Q}_i$,se les denotará por $\overline{\tau}_i, \overline{\zeta}_i$ para $i = 1, 2$, respectivamente.
- Los tiempos de traslado del servidor desde el momento en que termina de atender a una cola y llega a la siguiente para comenzar a dar servicio están dados por $\tau_{i+1} - \overline{\tau}_i$ y $\zeta_{i+1} - \overline{\zeta}_i$, $i = 1, 2$, para el sistema 1 y el sistema 2, respectivamente.

El uso de la Función Generadora de Probabilidades (FGP's) nos permite determinar las Funciones de Distribución de Probabilidades Conjunta de manera indirecta sin necesidad de hacer uso de las propiedades de las distribuciones de probabilidad de cada uno de los procesos que intervienen en la Red de Sistemas de Visitas Cíclicas.

Cada uno de estos procesos con su respectiva FGP. Además, para cada una de las colas en cada sistema, el número de usuarios al tiempo en que llega el servidor a dar servicio está dado por el número de usuarios presentes en la cola al tiempo t, más el número de usuarios que llegan a la cola en el intervalo de tiempo $[\tau_i, \overline{\tau}_i]$.

Una vez definidas las Funciones Generadoras de Probabilidades Conjuntas se construyen las ecuaciones recursivas que permiten obtener la información sobre la longitud de cada una de las colas, al momento en que uno de los servidores llega a una de las colas para dar servicio, basándose en la información que se tiene sobre su llegada a la cola inmediata anterior.

36.50.1. Funciones Generadoras de Probabilidades

Para cada uno de los procesos de llegada a las colas $X_i, \hat{X}_i$, $i = 1, 2$, y Y_2, con $\tilde{X}_2 = X_2 + Y_2$ anteriores se define su Función Generadora de Probabilidades (FGP): $P_i(z_i) = \mathbb{E}\left[z_i^{X_i(t)}\right], \hat{P}_i(w_i) = \mathbb{E}\left[w_i^{\hat{X}_i(t)}\right]$, para $i = 1, 2$, y $\check{P}_2(z_2) = \mathbb{E}\left[z_2^{Y_2(t)}\right], \tilde{P}_2(z_2) = \mathbb{E}\left[z_2^{\tilde{X}_2(t)}\right]$, con primer momento definidos por $\mu_i = \mathbb{E}[X_i(t)] = P_i^{(1)}(1), \hat{\mu}_i = \mathbb{E}\left[\hat{X}_i(t)\right] = \hat{P}_i^{(1)}(1)$, para $i = 1, 2$, y $\check{\mu}_2 = \mathbb{E}[Y_2(t)] = \check{P}_2^{(1)}(1), \tilde{\mu}_2 = \mathbb{E}\left[\tilde{X}_2(t)\right] = \tilde{P}_2^{(1)}(1)$.

En lo que respecta al servidor, en términos de los tiempos de visita a cada una de las colas, se denotarán por $B_i(t)$ a los procesos correspondientes a las variables aleatorias τ_i para Q_i, respectivamente; y $\hat{B}_i(t)$ con parámetros ζ_i para $\hat{Q}_i$, del sistema 2 respectivamente. Y a los tiempos en que el servidor termina de atender en las colas $Q_i, \hat{Q}_i$, se les denotará por $\overline{\tau}_i, \overline{\zeta}_i$ respectivamente. Entonces, los tiempos de servicio están dados por las diferencias $\overline{\tau}_i - \tau_i$ para Q_i, y $\overline{\zeta}_i - \zeta_i$ para $\hat{Q}_i$ respectivamente, para $i = 1, 2$.

Sus procesos se definen por: $S_i(z_i) = \mathbb{E}\left[z_i^{\overline{\tau}_i - \tau_i}\right]$ y $\hat{S}_i(w_i) = \mathbb{E}\left[w_i^{\overline{\zeta}_i - \zeta_i}\right]$, con primer momento dado por: $s_i = \mathbb{E}[\overline{\tau}_i - \tau_i]$ y $\hat{s}_i = \mathbb{E}\left[\overline{\zeta}_i - \zeta_i\right]$, para $i = 1, 2$. Análogamente los tiempos de traslado del servidor desde el momento en que termina de atender a una cola y llega a la siguiente para comenzar a dar servicio están dados por $\tau_{i+1} - \overline{\tau}_i$ y $\zeta_{i+1} - \overline{\zeta}_i$ para el sistema 1 y el sistema 2, respectivamente, con $i = 1, 2$.

La FGP para estos tiempos de traslado están dados por $R_i(z_i) = \mathbb{E}\left[z_1^{\tau_{i+1} - \overline{\tau}_i}\right]$ y $\hat{R}_i(w_i) = \mathbb{E}\left[w_i^{\zeta_{i+1} - \overline{\zeta}_i}\right]$ y al igual que como se hizo con anterioridad, se tienen los primeros momentos de estos procesos de traslado del servidor entre las colas de cada uno de los sistemas que conforman la red de sistemas de visitas cíclicas: $r_i = R_i^{(1)}(1) = \mathbb{E}[\tau_{i+1} - \overline{\tau}_i]$ y $\hat{r}_i = \hat{R}_i^{(1)}(1) = \mathbb{E}\left[\zeta_{i+1} - \overline{\zeta}_i\right]$ para $i = 1, 2$.

Se definen los procesos de conteo para el número de usuarios en cada una de las colas al tiempo t, $L_i(t)$, para $H_i(t)$ del sistema 1, mientras que para el segundo sistema, se tienen los procesos $\hat{L}_i(t)$ para $\hat{H}_i(t)$, es decir, $H_i(t) = \mathbb{E}\left[z_i^{L_i(t)}\right]$ y $\hat{H}_i(t) = \mathbb{E}\left[w_i^{\hat{L}_i(t)}\right]$. Con lo dichohasta ahora, se tiene que el número de usuarios presentes en los tiempos $\overline{\tau}_1, \overline{\tau}_2, \overline{\zeta}_1, \overline{\zeta}_2$, es cero, es decir, $L_i(\overline{\tau_i}) = 0$, y $\hat{L}_i\left(\overline{\zeta_i}\right) = 0$ para i=1,2 para cada uno de los dos sistemas.

Para cada una de las colas en cada sistema, el número de usuarios al tiempo en que llega el servidor a dar servicio está dado por el número de usuarios presentes en la cola al tiempo $t = \tau_i, \zeta_i$, más el número de usuarios que llegan a la cola en el intervalo de tiempo $[\tau_i, \overline{\tau}_i], \left[\zeta_i, \overline{\zeta}_i\right]$, es decir $\hat{L}_i(\overline{\tau}_j) = \hat{L}_i(\tau_j) + \hat{X}_i(\overline{\tau}_j - \tau_j)$, para $i, j = 1, 2$, mientras que para el primer sistema: $L_1(\overline{\tau}_j) = L_1(\tau_j) + X_1(\overline{\tau}_j - \tau_j)$. En el caso específico de Q_2, además, hay que considerar el número de usuarios que pasan del sistema 2 al sistema 1, a traves de $\hat{Q}_2$ mientras el servidor en Q_2 está ausente, es decir:

$$L_2(\overline{\tau}_1) = L_2(\tau_1) + X_2(\overline{\tau}_1 - \tau_1) + Y_2(\overline{\tau}_1 - \tau_1). \tag{36.50.1}$$

36.50.2. El problema de la ruina del jugador

Supongamos que se tiene un jugador que cuenta con un capital inicial de $\tilde{L}_0 \geq 0$ unidades, esta persona realiza una serie de dos juegos simultáneos e independientes de manera sucesiva, dichos eventos son independientes e idénticos entre sí para cada realización. La ganancia en el n-ésimo juego es $\tilde{X}_n = X_n + Y_n$ unidades de las cuales se resta una cuota de 1 unidad por cada juego simultáneo, es decir, se restan dos unidades por cada juego realizado. En términos de la teoría de colas puede pensarse como el número de usuarios que llegan a una cola vía dos procesos de arribo distintos e independientes entre sí. Su Función Generadora de Probabilidades (FGP) está dada por $F(z) = \mathbb{E}\left[z^{\tilde{L}_0}\right]$, además

$$\tilde{P}(z) = \mathbb{E}\left[z^{\tilde{X}_n}\right] = \mathbb{E}\left[z^{X_n+Y_n}\right] = \mathbb{E}\left[z^{X_n} z^{Y_n}\right] = \mathbb{E}\left[z^{X_n}\right]\mathbb{E}\left[z^{Y_n}\right] = P(z)\,\check{P}(z),$$

con $\tilde{\mu} = \mathbb{E}\left[\tilde{X}_n\right] = \tilde{P}[z] < 1$. Sea $\tilde{L}_n$ el capital remanente después del n-ésimo juego. Entonces

$$\tilde{L}_n = \tilde{L}_0 + \tilde{X}_1 + \tilde{X}_2 + \cdots + \tilde{X}_n - 2n.$$

La ruina del jugador ocurre después del n-ésimo juego, es decir, la cola se vacía después del n-ésimo juego, entonces sea T definida como $T = min\left\{\tilde{L}_n = 0\right\}$. Si $\tilde{L}_0 = 0$, entonces claramente $T = 0$. En este sentido T puede interpretarse como la longitud del periodo de tiempo que el servidor ocupa para dar servicio en la cola, comenzando con $\tilde{L}_0$ grupos de usuarios presentes en la cola, quienes arribaron conforme a un proceso dado por $\tilde{P}(z)$.

Sea $g_{n,k}$ la probabilidad del evento de que el jugador no caiga en ruina antes del n-ésimo juego, y que además tenga un capital de k unidades antes del n-ésimo juego, es decir,
Dada $n \in \{1, 2, \ldots,\}$ y $k \in \{0, 1, 2, \ldots,\}$

$$g_{n,k} := P\left\{\tilde{L}_j > 0, j = 1, \ldots, n, \tilde{L}_n = k\right\}$$

la cual además se puede escribir como:

$$\begin{aligned}
g_{n,k} &= P\left\{\tilde{L}_j > 0, j = 1, \ldots, n, \tilde{L}_n = k\right\} = \sum_{j=1}^{k+1} g_{n-1,j} P\left\{\tilde{X}_n = k - j + 1\right\} \\
&= \sum_{j=1}^{k+1} g_{n-1,j} P\{X_n + Y_n = k - j + 1\} = \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j} P\{X_n + Y_n = k - j + 1, Y_n = l\} \\
&= \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j} P\{X_n + Y_n = k - j + 1 | Y_n = l\} P\{Y_n = l\} \\
&= \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j} P\{X_n = k - j - l + 1\} P\{Y_n = l\}
\end{aligned}$$

es decir

$$g_{n,k} = \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j} P\{X_n = k - j - l + 1\} P\{Y_n = l\} \tag{36.50.2}$$

además

$$g_{0,k} = P\left\{\tilde{L}_0 = k\right\}. \tag{36.50.3}$$

Se definen las siguientes FGP:

$$G_n(z) = \sum_{k=0}^{\infty} g_{n,k} z^k, \text{ para } n = 0, 1, \ldots, \tag{36.50.4}$$

$$G(z, w) = \sum_{n=0}^{\infty} G_n(z) w^n. \tag{36.50.5}$$

En particular para $k = 0$,

$$g_{n,0} = G_n(0) = P\left\{\tilde{L}_j > 0, \text{ para } j < n, \text{ y } \tilde{L}_n = 0\right\} = P\{T = n\},$$

además

$$G(0, w) = \sum_{n=0}^{\infty} G_n(0) w^n = \sum_{n=0}^{\infty} P\{T = n\} w^n = \mathbb{E}\left[w^T\right]$$

la cuál resulta ser la FGP del tiempo de ruina T.

Proposición 36.50.1 *Sean $G_n(z)$ y $G(z,w)$ definidas como en (36.81.4) y (36.81.5) respectivamente, entonces*

$$G_n(z) = \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z). \tag{36.50.6}$$

Además

$$G(z,w) = \frac{zF(z) - wP(z)G(0,w)}{z - wR(z)}, \tag{36.50.7}$$

con un único polo en el círculo unitario, además, el polo es de la forma $z = \theta(w)$ y satisface que

i) $\tilde{\theta}(1) = 1$,

ii) $\tilde{\theta}^{(1)}(1) = \frac{1}{1-\tilde{\mu}}$,

iii) $\tilde{\theta}^{(2)}(1) = \frac{\tilde{\mu}}{(1-\tilde{\mu})^2} + \frac{\tilde{\sigma}}{(1-\tilde{\mu})^3}$.

Finalmente, además se cumple que

$$\mathbb{E}\left[w^T\right] = G(0,w) = F\left[\tilde{\theta}(w)\right]. \tag{36.50.8}$$

Multiplicando las ecuaciones (36.81.2) y (36.81.3) por el término z^k:

$$\begin{aligned}
g_{n,k}z^k &= \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}P\{X_n = k-j-l+1\}P\{Y_n = l\}z^k,\\
g_{0,k}z^k &= P\left\{\tilde{L}_0 = k\right\}z^k,
\end{aligned}$$

ahora sumamos sobre k

$$\begin{aligned}
\sum_{k=0}^{\infty} g_{n,k}z^k &= \sum_{k=0}^{\infty}\sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}P\{X_n = k-j-l+1\}P\{Y_n = l\}z^k\\
&= \sum_{k=0}^{\infty} z^k \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}P\{X_n = k-(j+l-1)\}P\{Y_n = l\}\\
&= \sum_{k=0}^{\infty} z^{k+(j+l-1)-(j+l-1)} \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}P\{X_n = k-(j+l-1)\}P\{Y_n = l\}\\
&= \sum_{k=0}^{\infty}\sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}z^{j-1}P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}P\{Y_n = l\}z^l\\
&= \sum_{j=1}^{\infty}\sum_{l=1}^{j} g_{n-1,j}z^{j-1}\sum_{k=j+l-1}^{\infty} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}P\{Y_n = l\}z^l\\
&= \sum_{j=1}^{\infty} g_{n-1,j}z^{j-1}\sum_{l=1}^{j}\sum_{k=j+l-1}^{\infty} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}P\{Y_n = l\}z^l\\
&= \sum_{j=1}^{\infty} g_{n-1,j}z^{j-1}\sum_{k=j+l-1}^{\infty}\sum_{l=1}^{j} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}P\{Y_n = l\}z^l
\end{aligned}$$

luego

$$\begin{aligned}
&= \sum_{j=1}^{\infty} g_{n-1,j}z^{j-1}\sum_{k=j+l-1}^{\infty}\sum_{l=1}^{j} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}\sum_{l=1}^{j} P\{Y_n = l\}z^l\\
&= \sum_{j=1}^{\infty} g_{n-1,j}z^{j-1}\sum_{l=1}^{\infty} P\{Y_n = l\}z^l\sum_{k=j+l-1}^{\infty}\sum_{l=1}^{j} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}\\
&= \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z)\sum_{k=j+l-1}^{\infty}\sum_{l=1}^{j} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}\\
&= \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z)P(z) = \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z),
\end{aligned}$$

es decir la ecuación (36.81.4) se puede reescribir como

$$G_n(z) = \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z). \tag{36.50.9}$$

Por otra parte recordemos la ecuación (36.81.4)

$$G_n(z) = \sum_{k=0}^{\infty} g_{n,k} z^k, \text{ entonces } \frac{G_n(z)}{z} = \sum_{k=1}^{\infty} g_{n,k} z^{k-1},$$

Por lo tanto utilizando la ecuación (36.81.9):

$$\begin{aligned} G(z,w) &= \sum_{n=0}^{\infty} G_n(z) w^n = G_0(z) + \sum_{n=1}^{\infty} G_n(z) w^n = F(z) + \sum_{n=0}^{\infty}\left[G_n(z) - G_n(0)\right] w^n \frac{\tilde{P}(z)}{z} \\ &= F(z) + \frac{w}{z}\sum_{n=0}^{\infty}\left[G_n(z) - G_n(0)\right] w^{n-1}\tilde{P}(z) \end{aligned}$$

es decir

$$G(z,w) = F(z) + \frac{w}{z}\left[G(z,w) - G(0,w)\right]\tilde{P}(z),$$

entonces

$$\begin{aligned} G(z,w) = F(z) + \frac{w}{z}\left[G(z,w) - G(0,w)\right]\tilde{P}(z) &= F(z) + \frac{w}{z}\tilde{P}(z)G(z,w) - \frac{w}{z}\tilde{P}(z)G(0,w) \\ &\Leftrightarrow \\ G(z,w)\left\{1 - \frac{w}{z}\tilde{P}(z)\right\} &= F(z) - \frac{w}{z}\tilde{P}(z)G(0,w), \end{aligned}$$

por lo tanto,

$$G(z,w) = \frac{zF(z) - w\tilde{P}(z)G(0,w)}{1 - w\tilde{P}(z)}. \tag{36.50.10}$$

Ahora $G(z,w)$ es analítica en $|z| = 1$. Sean z, w tales que $|z| = 1$ y $|w| \leq 1$, como $\tilde{P}(z)$ es FGP

$$|z - \left(z - w\tilde{P}(z)\right)| < |z| \Leftrightarrow |w\tilde{P}(z)| < |z|$$

es decir, se cumplen las condiciones del Teorema de Rouché y por tanto, z y $z - w\tilde{P}(z)$ tienen el mismo número de ceros en $|z| = 1$. Sea $z = \tilde{\theta}(w)$ la solución única de $z - w\tilde{P}(z)$, es decir

$$\tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right) = 0, \tag{36.50.11}$$

con $|\tilde{\theta}(w)| < 1$. Cabe hacer mención que $\tilde{\theta}(w)$ es la FGP para el tiempo de ruina cuando $\tilde{L}_0 = 1$.

Considerando la ecuación (36.81.11)

$$\begin{aligned} 0 &= \frac{\partial}{\partial w}\tilde{\theta}(w)|_{w=1} - \frac{\partial}{\partial w}\left\{w\tilde{P}\left(\tilde{\theta}(w)\right)\right\}|_{w=1} = \tilde{\theta}^{(1)}(w)|_{w=1} - \frac{\partial}{\partial w} w\left\{\tilde{P}\left(\tilde{\theta}(w)\right)\right\}|_{w=1} \\ &- w\frac{\partial}{\partial w}\tilde{P}\left(\tilde{\theta}(w)\right)|_{w=1} = \tilde{\theta}^{(1)}(1) - \tilde{P}\left(\tilde{\theta}(1)\right) - w\left\{\frac{\partial\tilde{P}\left(\tilde{\theta}(w)\right)}{\partial\tilde{\theta}(w)} \cdot \frac{\partial\tilde{\theta}(w)}{\partial w}|_{w=1}\right\} \\ &\tilde{\theta}^{(1)}(1) - \tilde{P}\left(\tilde{\theta}(1)\right) - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right) \cdot \tilde{\theta}^{(1)}(1), \end{aligned}$$

luego

$$\tilde{P}\left(\tilde{\theta}(1)\right) = \tilde{\theta}^{(1)}(1) - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right) \cdot \tilde{\theta}^{(1)}(1) = \tilde{\theta}^{(1)}(1)\left(1 - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)\right),$$

por tanto

$$\tilde{\theta}^{(1)}(1) = \frac{\tilde{P}\left(\tilde{\theta}(1)\right)}{\left(1 - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)\right)} = \frac{1}{1 - \tilde{\mu}}.$$

Ahora determinemos el segundo momento de $\tilde{\theta}(w)$, nuevamente consideremos la ecuación (36.81.11):

$$0 = \tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right) \Rightarrow 0 = \frac{\partial}{\partial w}\left\{\tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right)\right\} \Rightarrow 0 = \frac{\partial}{\partial w}\left\{\frac{\partial}{\partial w}\left\{\tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right)\right\}\right\}$$

luego

$$
\begin{aligned}
& \frac{\partial}{\partial w}\left\{\frac{\partial}{\partial w}\tilde{\theta}(w)-\frac{\partial}{\partial w}\left[w\tilde{P}\left(\tilde{\theta}(w)\right)\right]\right\}=\frac{\partial}{\partial w}\left\{\frac{\partial}{\partial w}\tilde{\theta}(w)-\frac{\partial}{\partial w}\left[w\tilde{P}\left(\tilde{\theta}(w)\right)\right]\right\} \\
= & \frac{\partial}{\partial w}\left\{\frac{\partial\tilde{\theta}(w)}{\partial w}-\left[\tilde{P}\left(\tilde{\theta}(w)\right)+w\frac{\partial}{\partial w}R\left(\tilde{\theta}(w)\right)\right]\right\}=\frac{\partial}{\partial w}\left\{\frac{\partial\tilde{\theta}(w)}{\partial w}-\left[\tilde{P}\left(\tilde{\theta}(w)\right)+w\frac{\partial\tilde{P}\left(\tilde{\theta}(w)\right)}{\partial w}\frac{\partial\tilde{\theta}(w)}{\partial w}\right]\right\} \\
= & \frac{\partial}{\partial w}\left\{\tilde{\theta}^{(1)}(w)-\tilde{P}\left(\tilde{\theta}(w)\right)-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)\right\} \\
= & \frac{\partial}{\partial w}\tilde{\theta}^{(1)}(w)-\frac{\partial}{\partial w}\tilde{P}\left(\tilde{\theta}(w)\right)-\frac{\partial}{\partial w}\left[w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)\right] \\
= & \frac{\partial}{\partial w}\tilde{\theta}^{(1)}(w)-\frac{\partial\tilde{P}\left(\tilde{\theta}(w)\right)}{\partial\tilde{\theta}(w)}\frac{\partial\tilde{\theta}(w)}{\partial w}-\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)-w\frac{\partial\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}{\partial w}\tilde{\theta}^{(1)}(w)-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\frac{\partial\tilde{\theta}^{(1)}(w)}{\partial w} \\
= & \tilde{\theta}^{(2)}(w)-\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)-\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)-w\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)\left(\tilde{\theta}^{(1)}(w)\right)^{2}-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(2)}(w) \\
= & \tilde{\theta}^{(2)}(w)-2\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)-w\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)\left(\tilde{\theta}^{(1)}(w)\right)^{2}-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(2)}(w) \\
= & \tilde{\theta}^{(2)}(w)\left[1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right]-\tilde{\theta}^{(1)}(w)\left[w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)+2\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right]
\end{aligned}
$$

luego

$$
\begin{aligned}
\tilde{\theta}^{(2)}(w)\left[1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right] & - \tilde{\theta}^{(1)}(w)\left[w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)+2\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right]=0 \\
\tilde{\theta}^{(2)}(w) & = \frac{\tilde{\theta}^{(1)}(w)\left[w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)+2R^{(1)}\left(\tilde{\theta}(w)\right)\right]}{1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)} \\
\tilde{\theta}^{(2)}(w) & = \frac{\tilde{\theta}^{(1)}(w)w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)}{1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}+\frac{2\tilde{\theta}^{(1)}(w)\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}{1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}
\end{aligned}
$$

si evaluamos la expresión anterior en $w=1$:

$$
\begin{aligned}
\tilde{\theta}^{(2)}(1) & = \frac{\left(\tilde{\theta}^{(1)}(1)\right)^{2}\tilde{P}^{(2)}\left(\tilde{\theta}(1)\right)}{1-\tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)}+\frac{2\tilde{\theta}^{(1)}(1)\tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)}{1-\tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)}=\frac{\left(\tilde{\theta}^{(1)}(1)\right)^{2}\tilde{P}^{(2)}(1)}{1-\tilde{P}^{(1)}(1)}+\frac{2\tilde{\theta}^{(1)}(1)\tilde{P}^{(1)}(1)}{1-\tilde{P}^{(1)}(1)} \\
& = \frac{\left(\frac{1}{1-\tilde{\mu}}\right)^{2}\tilde{P}^{(2)}(1)}{1-\tilde{\mu}}+\frac{2\left(\frac{1}{1-\tilde{\mu}}\right)\tilde{\mu}}{1-\tilde{\mu}}=\frac{\tilde{P}^{(2)}(1)}{(1-\tilde{\mu})^{3}}+\frac{2\tilde{\mu}}{(1-\tilde{\mu})^{2}}=\frac{\sigma^{2}-\tilde{\mu}+\tilde{\mu}^{2}}{(1-\tilde{\mu})^{3}}+\frac{2\tilde{\mu}}{(1-\tilde{\mu})^{2}} \\
& = \frac{\sigma^{2}-\tilde{\mu}+\tilde{\mu}^{2}+2\tilde{\mu}(1-\tilde{\mu})}{(1-\tilde{\mu})^{3}}
\end{aligned}
$$

es decir

$$
\tilde{\theta}^{(2)}(1) = \frac{\sigma^{2}+\tilde{\mu}-\tilde{\mu}^{2}}{(1-\tilde{\mu})^{3}}=\frac{\sigma^{2}}{(1-\tilde{\mu})^{3}}+\frac{\tilde{\mu}(1-\tilde{\mu})}{(1-\tilde{\mu})^{3}}=\frac{\sigma^{2}}{(1-\tilde{\mu})^{3}}+\frac{\tilde{\mu}}{(1-\tilde{\mu})^{2}}.
$$

Corolario 36.50.1 *El tiempo de ruina del jugador tiene primer y segundo momento dados por*

$$
\mathbb{E}[T] = \frac{\mathbb{E}\left[\tilde{L}_{0}\right]}{1-\tilde{\mu}} \tag{36.50.12}
$$

$$
Var[T] = \frac{Var\left[\tilde{L}_{0}\right]}{(1-\tilde{\mu})^{2}}+\frac{\sigma^{2}\mathbb{E}\left[\tilde{L}_{0}\right]}{(1-\tilde{\mu})^{3}}. \tag{36.50.13}
$$

36.51. Procesos de Llegadas a las colas en la RSVC

Se definen los procesos de llegada de los usuarios a cada una de las colas dependiendo de la llegada del servidor pero del sistema al cuál no pertenece la cola en cuestión:

Para el sistema 1 y el servidor del segundo sistema

$$F_{i,j}\left(z_i;\zeta_j\right)=\mathbb{E}\left[z_i^{L_i(\zeta_j)}\right]=\sum_{k=0}^{\infty}\mathbb{P}\left[L_i\left(\zeta_j\right)=k\right]z_i^k,\text{ para } i,j=1,2.$$

Ahora se definen para el segundo sistema y el servidor del primero

$$\hat{F}_{i,j}\left(w_i;\tau_j\right) = \mathbb{E}\left[w_i^{\hat{L}_i(\tau_j)}\right]=\sum_{k=0}^{\infty}\mathbb{P}\left[\hat{L}_i\left(\tau_j\right)=k\right]w_i^k,\text{ para } i,j=1,2.$$

Ahora, con lo anterior definamos la FGP conjunta para el segundo sistema;

$$\mathbb{E}\left[w_1^{\hat{L}_1(\tau_j)}w_2^{\hat{L}_2(\tau_j)}\right] = \mathbb{E}\left[w_1^{\hat{L}_1(\tau_j)}\right]\mathbb{E}\left[w_2^{\hat{L}_2(\tau_j)}\right]=\hat{F}_{1,j}\left(w_1;\tau_j\right)\hat{F}_{2,j}\left(w_2;\tau_j\right)=\hat{F}_j\left(w_1,w_2;\tau_j\right).$$

Con respecto al sistema 1 se tiene la FGP conjunta con respecto al servidor del otro sistema:

$$\mathbb{E}\left[z_1^{L_1(\zeta_j)}z_2^{L_2(\zeta_j)}\right] = \mathbb{E}\left[z_1^{L_1(\zeta_j)}\right]\mathbb{E}\left[z_2^{L_2(\zeta_j)}\right]=F_{1,j}\left(z_1;\zeta_j\right)F_{2,j}\left(z_2;\zeta_j\right)=F_j\left(z_1,z_2;\zeta_j\right).$$

Ahora analicemos la Red de Sistemas de Visitas Cíclicas, entonces se define la PGF conjunta al tiempo t para los tiempos de visita del servidor en cada una de las colas, para comenzar a dar servicio, definidos anteriormente al tiempo $t=\{\tau_1,\tau_2,\zeta_1,\zeta_2\}$:

$$F_j\left(z_1,z_2,w_1,w_2\right) = \mathbb{E}\left[\prod_{i=1}^{2}z_i^{L_i(\tau_j)}\prod_{i=1}^{2}w_i^{\hat{L}_i(\tau_j)}\right] \tag{36.51.1}$$

$$\hat{F}_j\left(z_1,z_2,w_1,w_2\right) = \mathbb{E}\left[\prod_{i=1}^{2}z_i^{L_i(\zeta_j)}\prod_{i=1}^{2}w_i^{\hat{L}_i(\zeta_j)}\right] \tag{36.51.2}$$

para $j=1,2$. Entonces, con la finalidad de encontrar el número de usuarios presentes en el sistema cuando el servidor deja de atender una de las colas de cualquier sistema se tiene lo siguiente

$$\begin{aligned}
&\mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)}z_2^{L_2(\overline{\tau}_1)}w_1^{\hat{L}_1(\overline{\tau}_1)}w_2^{\hat{L}_2(\overline{\tau}_1)}\right]=\mathbb{E}\left[z_2^{L_2(\overline{\tau}_1)}w_1^{\hat{L}_1(\overline{\tau}_1)}w_2^{\hat{L}_2(\overline{\tau}_1)}\right]\\
=\;&\mathbb{E}\left[z_2^{L_2(\tau_1)+X_2(\overline{\tau}_1-\tau_1)+Y_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{L}_1(\tau_1)+\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{L}_2(\tau_1)+\hat{X}_2(\overline{\tau}_1-\tau_1)}\right]
\end{aligned}$$

utilizando la ecuacion dada (37.4.1), luego

$$\begin{aligned}
=\;&\mathbb{E}\left[z_2^{L_2(\tau_1)}z_2^{X_2(\overline{\tau}_1-\tau_1)}z_2^{Y_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{L}_1(\tau_1)}w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{L}_2(\tau_1)}w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right]\\
=\;&\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right\}\left\{z_2^{X_2(\overline{\tau}_1-\tau_1)}z_2^{Y_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right]
\end{aligned}$$

Aplicando el hecho de que el número de usuarios que llegan a cada una de las colas del segundo sistema es independiente de las llegadas a las colas del primer sistema:

$$=\;\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{z_2^{X_2(\overline{\tau}_1-\tau_1)}z_2^{Y_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]$$

dado que los arribos a cada una de las colas son independientes, podemos separar la esperanza para los procesos de llegada a Q_1 y Q_2 al tiempo τ_1, que es el tiempo en que el servidor visita a Q_1. Recordando que $\tilde{X}_2\left(z_2\right)=X_2\left(z_2\right)+Y_2\left(z_2\right)$ se tiene

$$\begin{aligned}
=\;&\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{z_2^{\tilde{X}_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]\\
=\;&\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{\tilde{P}_2\left(z_2\right)^{\overline{\tau}_1-\tau_1}\hat{P}_1\left(w_1\right)^{\overline{\tau}_1-\tau_1}\hat{P}_2\left(w_2\right)^{\overline{\tau}_1-\tau_1}\right\}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]\\
=\;&\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right\}^{\overline{\tau}_1-\tau_1}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]\\
=\;&\mathbb{E}\left[z_2^{L_2(\tau_1)}\theta_1\left(\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right)^{L_1(\tau_1)}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]\\
=\;&F_1\left(\theta_1\left(\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),z2\right)\hat{F}_1\left(w_1,w_2;\tau_1\right)\\
\equiv\;&F_1\left(\theta_1\left(\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),z_2,w_1,w_2\right)
\end{aligned}$$

Las igualdades anteriores son ciertas pues el número de usuarios que llegan a $\hat{Q}_2$ durante el intervalo $[\tau_1, \overline{\tau}_1]$ aún no han sido atendidos por el servidor del sistema 2 y por tanto aún no pueden pasar al sistema 1 a traves de Q_2. Por tanto el número de usuarios que pasan de $\hat{Q}_2$ a Q_2 en el intervalo de tiempo $[\tau_1, \overline{\tau}_1]$ depende de la política de traslado entre los dos sistemas, conforme a la sección anterior.

Por lo tanto

$$\begin{aligned}
\mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)} z_2^{L_2(\overline{\tau}_1)} w_1^{\hat{L}_1(\overline{\tau}_1)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right] &= F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right) && (36.51.3)\\
&= F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z2\right)\hat{F}_1(w_1, w_2; \tau_1) && (36.51.4)
\end{aligned}$$

Utilizando un razonamiento análogo para $\overline{\tau}_2$:

$$\begin{aligned}
&\mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)} z_2^{L_2(\overline{\tau}_2)} w_1^{\hat{L}_1(\overline{\tau}_2)} w_2^{\hat{L}_2(\overline{\tau}_2)}\right] = \mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)} w_1^{\hat{L}_1(\overline{\tau}_2)} w_2^{\hat{L}_2(\overline{\tau}_2)}\right]\\
=\ & \mathbb{E}\left[z_1^{L_1(\tau_2)+X_1(\overline{\tau}_2-\tau_2)} w_1^{\hat{L}_1(\tau_2)+\hat{X}_1(\overline{\tau}_2-\tau_2)} w_2^{\hat{L}_2(\tau_2)+\hat{X}_2(\overline{\tau}_2-\tau_2)}\right]\\
=\ & \mathbb{E}\left[z_1^{L_1(\tau_2)} z_1^{X_1(\overline{\tau}_2-\tau_2)} w_1^{\hat{L}_1(\tau_2)} w_1^{\hat{X}_1(\overline{\tau}_2-\tau_2)} w_2^{\hat{L}_2(\tau_2)} w_2^{\hat{X}_2(\overline{\tau}_2-\tau_2)}\right]\\
=\ & \mathbb{E}\left[z_1^{L_1(\tau_2)} z_1^{X_1(\overline{\tau}_2-\tau_2)} w_1^{\hat{X}_1(\overline{\tau}_2-\tau_2)} w_2^{\hat{X}_2(\overline{\tau}_2-\tau_2)}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)} w_2^{\hat{L}_2(\tau_2)}\right]\\
=\ & \mathbb{E}\left[z_1^{L_1(\tau_2)} P_1(z_1)^{\overline{\tau}_2-\tau_2}\,\hat{P}_1(w_1)^{\overline{\tau}_2-\tau_2}\,\hat{P}_2(w_2)^{\overline{\tau}_2-\tau_2}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)} w_2^{\hat{L}_2(\tau_2)}\right]
\end{aligned}$$

utlizando la proposición relacionada con la ruina del jugador

$$\begin{aligned}
=\ & \mathbb{E}\left[z_1^{L_1(\tau_2)}\left\{P_1(z_1)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right\}^{\overline{\tau}_2-\tau_2}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)} w_2^{\hat{L}_2(\tau_2)}\right]\\
=\ & \mathbb{E}\left[z_1^{L_1(\tau_2)}\tilde{\theta}_2\left(P_1(z_1)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right)^{L_2(\tau_2)}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)} w_2^{\hat{L}_2(\tau_2)}\right]\\
=\ & F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right)\right)\hat{F}_2(w_1, w_2; \tau_2)
\end{aligned}$$

entonces se define

$$\begin{aligned}
\mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)} z_2^{L_2(\overline{\tau}_2)} w_1^{\hat{L}_1(\overline{\tau}_2)} w_2^{\hat{L}_2(\overline{\tau}_2)}\right] &= F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), w_1, w_2\right) && (36.51.5)\\
&\equiv F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right)\right)\hat{F}_2(w_1, w_2; \tau_2) && (36.51.6)
\end{aligned}$$

Ahora para $\overline{\zeta}_1$:

$$\begin{aligned}
&\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)} z_2^{L_2(\overline{\zeta}_1)} w_1^{\hat{L}_1(\overline{\zeta}_1)} w_2^{\hat{L}_2(\overline{\zeta}_1)}\right] = \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)} z_2^{L_2(\overline{\zeta}_1)} w_2^{\hat{L}_2(\overline{\zeta}_1)}\right]\\
=\ & \mathbb{E}\left[z_1^{L_1(\zeta_1)} z_1^{X_1(\overline{\zeta}_1-\zeta_1)} z_2^{L_2(\zeta_1)} z_2^{X_2(\overline{\zeta}_1-\zeta_1)} z_2^{Y_2(\overline{\zeta}_1-\zeta_1)} w_2^{\hat{L}_2(\zeta_1)} w_2^{\hat{X}_2(\overline{\zeta}_1-\zeta_1)}\right]\\
=\ & \mathbb{E}\left[z_1^{L_1(\zeta_1)} z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[z_1^{X_1(\overline{\zeta}_1-\zeta_1)} z_2^{\tilde{X}_2(\overline{\zeta}_1-\zeta_1)} w_2^{\hat{X}_2(\overline{\zeta}_1-\zeta_1)} w_2^{\hat{L}_2(\zeta_1)}\right]\\
=\ & \mathbb{E}\left[z_1^{L_1(\zeta_1)} z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[P_1(z_1)^{\overline{\zeta}_1-\zeta_1}\,\tilde{P}_2(z_2)^{\overline{\zeta}_1-\zeta_1}\,\hat{P}_2(w_2)^{\overline{\zeta}_1-\zeta_1}\,w_2^{\hat{L}_2(\zeta_1)}\right]\\
=\ & \mathbb{E}\left[z_1^{L_1(\zeta_1)} z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[\left\{P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_2(w_2)\right\}^{\overline{\zeta}_1-\zeta_1}\,w_2^{\hat{L}_2(\zeta_1)}\right]\\
=\ & \mathbb{E}\left[z_1^{L_1(\zeta_1)} z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[\hat{\theta}_1\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_2(w_2)\right)^{\hat{L}_1(\zeta_1)}\,w_2^{\hat{L}_2(\zeta_1)}\right]\\
=\ & F_1(z_1, z_2; \zeta_1)\,\hat{F}_1\left(\hat{\theta}_1\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_2(w_2)\right), w_2\right)
\end{aligned}$$

es decir

$$\begin{aligned}
\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)} z_2^{L_2(\overline{\zeta}_1)} w_1^{\hat{L}_1(\overline{\zeta}_1)} w_2^{\hat{L}_2(\overline{\zeta}_1)}\right] &= \hat{F}_1\left(z_1, z_2, \hat{\theta}_1\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_2(w_2)\right), w_2\right) && (36.51.7)\\
&= F_1(z_1, z_2; \zeta_1)\,\hat{F}_1\left(\hat{\theta}_1\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_2(w_2)\right), w_2\right). && (36.51.8)
\end{aligned}$$

Finalmente para $\overline{\zeta}_2$:

$$\begin{aligned}
& \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)} w_2^{\hat{L}_2(\overline{\zeta}_2)}\right] = \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)}\right] \\
= & \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_1^{X_1(\overline{\zeta}_2-\zeta_2)} z_2^{L_2(\zeta_2)} z_2^{X_2(\overline{\zeta}_2-\zeta_2)} z_2^{Y_2(\overline{\zeta}_2-\zeta_2)} w_1^{\hat{L}_1(\zeta_2)} w_1^{\hat{X}_1(\overline{\zeta}_2-\zeta_2)}\right] \\
= & \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_2^{L_2(\zeta_2)}\right] \mathbb{E}\left[z_1^{X_1(\overline{\zeta}_2-\zeta_2)} z_2^{\tilde{X}_2(\overline{\zeta}_2-\zeta_2)} w_1^{\hat{X}_1(\overline{\zeta}_2-\zeta_2)} w_1^{\hat{L}_1(\zeta_2)}\right] \\
= & \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_2^{L_2(\zeta_2)}\right] \mathbb{E}\left[P_1(z_1)^{\overline{\zeta}_2-\zeta_2}\, \tilde{P}_2(z_2)^{\overline{\zeta}_2-\zeta_2}\, \hat{P}(w_1)^{\overline{\zeta}_2-\zeta_2}\, w_1^{\hat{L}_1(\zeta_2)}\right] \\
= & \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_2^{L_2(\zeta_2)}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\zeta_2)} \left\{P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}(w_1)\right\}^{\overline{\zeta}_2-\zeta_2}\right] \\
= & \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_2^{L_2(\zeta_2)}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\zeta_2)} \hat{\theta}_2\left(P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}(w_1)\right)^{\hat{L}_2\zeta_2}\right] \\
= & F_2(z_1, z_2; \zeta_2)\, \hat{F}_2\left(w_1, \hat{\theta}_2\left(P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}_1(w_1)\right)\right]
\end{aligned}$$

es decir

$$\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)} w_2^{\hat{L}_2(\overline{\zeta}_2)}\right] = \hat{F}_2\left(z_1, z_2, w_1, \hat{\theta}_2\left(P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}_1(w_1)\right)\right) \tag{36.51.9}$$

$$= F_2(z_1, z_2; \zeta_2)\, \hat{F}_2\left(w_1, \hat{\theta}_2\left(P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}_1(w_1)\right)\right) \tag{36.51.10}$$

36.52. Ecuaciones Recursivas para la R.S.V.C.

Con lo desarrollado hasta ahora podemos encontrar las ecuaciones recursivas que modelan la Red de Sistemas de Visitas Cíclicas (R.S.V.C):

$$\begin{aligned}
F_2(z_1, z_2, w_1, w_2) &= R_1(z_1, z_2, w_1, w_2)\, \mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)} z_2^{L_2(\overline{\tau}_1)} w_1^{\hat{L}_1(\overline{\tau}_1)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right] \\
F_1(z_1, z_2, w_1, w_2) &= R_2(z_1, z_2, w_1, w_2)\, \mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)} z_2^{L_2(\overline{\tau}_2)} w_1^{\hat{L}_1(\overline{\tau}_2)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right] \\
\hat{F}_2(z_1, z_2, w_1, w_2) &= \hat{R}_1(z_1, z_2, w_1, w_2)\, \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)} z_2^{L_2(\overline{\zeta}_1)} w_1^{\hat{L}_1(\overline{\zeta}_1)} w_2^{\hat{L}_2(\overline{\zeta}_1)}\right] \\
\hat{F}_1(z_1, z_2, w_1, w_2) &= \hat{R}_2(z_1, z_2, w_1, w_2)\, \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)} w_2^{\hat{L}_2(\overline{\zeta}_2)}\right]
\end{aligned}$$

que son equivalentes a las siguientes ecuaciones

$$F_2(z_1, z_2, w_1, w_2) = R_1\left(P_1(z_1)\, \tilde{P}_2(z_2) \prod_{i=1}^{2} \hat{P}_i(w_i)\right) F_1\left(\theta_1\left(\tilde{P}_2(z_2)\, \hat{P}_1(w_1)\, \hat{P}_2(w_2)\right), z_2, w_1, w_2\right) \tag{36.52.1}$$

$$F_1(z_1, z_2, w_1, w_2) = R_2\left(P_1(z_1)\, \tilde{P}_2(z_2) \prod_{i=1}^{2} \hat{P}_i(w_i)\right) F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\, \hat{P}_1(w_1)\, \hat{P}_2(w_2)\right), w_1, w_2\right) \tag{36.52.2}$$

$$\hat{F}_2(z_1, z_2, w_1, w_2) = \hat{R}_1\left(P_1(z_1)\, \tilde{P}_2(z_2) \prod_{i=1}^{2} \hat{P}_i(w_i)\right) \hat{F}_1\left(z_1, z_2, \hat{\theta}_1\left(P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}_2(w_2)\right), w_2\right) \tag{36.52.3}$$

$$\hat{F}_1(z_1, z_2, w_1, w_2) = \hat{R}_2\left(P_1(z_1)\, \tilde{P}_2(z_2) \prod_{i=1}^{2} \hat{P}_i(w_i)\right) \hat{F}_2\left(z_1, z_2, w_1, \hat{\theta}_2\left(P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}_1(w_1)\right)\right) \tag{36.52.4}$$

36.52.1. Tiempos de Traslado del Servidor

Para

$$R_1(\mathbf{z}, \mathbf{w}) = R_1\left((P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}_1(w_1)\, \hat{P}_2(w_2)\right) \tag{36.52.5}$$

se tiene que

$$\begin{aligned}
\tfrac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= R_1^{(1)}(1)\, P_1^{(1)}(1) = r_1\mu_1, & \tfrac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= R_1^{(1)}(1)\, \tilde{P}_2^{(1)}(1) = r_1\tilde{\mu}_2, \\
\tfrac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= R_1^{(1)}(1)\, \hat{P}_1^{(1)}(1) = r_1\hat{\mu}_1, & \tfrac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= R_1^{(1)}(1)\, \hat{P}_2^{(1)}(1) = r_1\hat{\mu}_2,
\end{aligned}$$

Análogamente se tiene

$$R_2(\mathbf{z},\mathbf{w}) = R_2\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right) \tag{36.52.6}$$

$$\begin{array}{ll}\frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} = R_2^{(1)}(1)\,P_1^{(1)}(1) = r_2\mu_1, & \frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} = R_2^{(1)}(1)\,\tilde{P}_2^{(1)}(1) = r_2\tilde{\mu}_2,\\ \frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} = R_2^{(1)}(1)\,\hat{P}_1^{(1)}(1) = r_2\hat{\mu}_1, & \frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} = R_2^{(1)}(1)\,\hat{P}_2^{(1)}(1) = r_2\hat{\mu}_2,\end{array}$$

Para el segundo sistema:

$$\hat{R}_1(\mathbf{z},\mathbf{w}) = \hat{R}_1\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right) \tag{36.52.7}$$

$$\begin{array}{ll}\frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_1^{(1)}(1)\,P_1^{(1)}(1) = \hat{r}_1\mu_1, & \frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_1^{(1)}(1)\,\tilde{P}_2^{(1)}(1) = \hat{r}_1\tilde{\mu}_2,\\ \frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_1^{(1)}(1)\,\hat{P}_1^{(1)}(1) = \hat{r}_1\hat{\mu}_1, & \frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_1^{(1)}(1)\,\hat{P}_2^{(1)}(1) = \hat{r}_1\hat{\mu}_2,\end{array}$$

Finalmente

$$\hat{R}_2(\mathbf{z},\mathbf{w}) = \hat{R}_2\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right) \tag{36.52.8}$$

$$\begin{array}{ll}\frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_2^{(1)}(1)\,P_1^{(1)}(1) = \hat{r}_2\mu_1, & \frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_2^{(1)}(1)\,\tilde{P}_2^{(1)}(1) = \hat{r}_2\tilde{\mu}_2,\\ \frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_2^{(1)}(1)\,\hat{P}_1^{(1)}(1) = \hat{r}_2\hat{\mu}_1, & \frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_2^{(1)}(1)\,\hat{P}_2^{(1)}(1) = \hat{r}_2\hat{\mu}_2.\end{array}$$

36.52.2. Usuarios presentes en la cola

Hagamos lo correspondiente con las siguientes expresiones obtenidas en la sección anterior: Recordemos que

$$F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right) = F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2\right)\hat{F}_1(w_1, w_2; \tau_1)$$

entonces

$$\begin{array}{rcl}\frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} & = & 0\\ \frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} & = & \frac{\partial F_1}{\partial z_1}\cdot\frac{\partial \theta_1}{\partial \tilde{P}_2}\cdot\frac{\partial \tilde{P}_2}{\partial z_2} + \frac{\partial F_1}{\partial z_2}\\ \frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} & = & \frac{\partial F_1}{\partial z_1}\cdot\frac{\partial \theta_1}{\partial \hat{P}_1}\cdot\frac{\partial \hat{P}_1}{\partial w_1} + \frac{\partial \hat{F}_1}{\partial w_1}\\ \frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} & = & \frac{\partial F_1}{\partial z_1}\cdot\frac{\partial \theta_1}{\partial \hat{P}_2}\cdot\frac{\partial \hat{P}_2}{\partial w_2} + \frac{\partial \hat{F}_1}{\partial w_2}\end{array}$$

para τ_2:

$$F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), w_1, w_2\right) = F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right)\right)\hat{F}_2(w_1, w_2; \tau_2)$$

al igual que antes

$$
\begin{aligned}
\frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_2}{\partial z_2}\cdot\frac{\partial\tilde{\theta}_2}{\partial P_1}\cdot\frac{\partial P_1}{\partial z_2}+\frac{\partial F_2}{\partial z_1}\\
\frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= 0\\
\frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_2}{\partial z_2}\cdot\frac{\partial\tilde{\theta}_2}{\partial \hat{P}_1}\cdot\frac{\partial \hat{P}_1}{\partial w_1}+\frac{\partial \hat{F}_2}{\partial w_1}\\
\frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_2}{\partial z_2}\cdot\frac{\partial\tilde{\theta}_2}{\partial \hat{P}_2}\cdot\frac{\partial \hat{P}_2}{\partial w_2}+\frac{\partial \hat{F}_2}{\partial w_2}
\end{aligned}
$$

Ahora para el segundo sistema

$$
\hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)=F_1\left(z_1,z_2;\zeta_1\right)\hat{F}_1\left(\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)
$$

entonces

$$
\begin{aligned}
\frac{\partial \hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{F}_1}{\partial w_1}\cdot\frac{\partial\hat{\theta}_1}{\partial P_1}\cdot\frac{\partial P_1}{\partial z_1}+\frac{\partial F_1}{\partial z_1}\\
\frac{\partial \hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{F}_1}{\partial w_1}\cdot\frac{\partial\hat{\theta}_1}{\partial \tilde{P}_2}\cdot\frac{\partial \tilde{P}_2}{\partial z_2}+\frac{\partial F_1}{\partial z_2}\\
\frac{\partial \hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= 0\\
\frac{\partial \hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{F}_1}{\partial w_1}\cdot\frac{\partial\hat{\theta}_1}{\partial \hat{P}_2}\cdot\frac{\partial \hat{P}_2}{\partial w_2}+\frac{\partial \hat{F}_1}{\partial w_2}
\end{aligned}
$$

Finalmente para ζ_2

$$
\hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right) = F_2\left(z_1,z_2;\zeta_2\right)\hat{F}_2\left(w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right]
$$

por tanto:

$$
\begin{aligned}
\frac{\partial \hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{F}_2}{\partial w_2}\cdot\frac{\partial\hat{\theta}_2}{\partial P_1}\cdot\frac{\partial P_1}{\partial z_1}+\frac{\partial F_2}{\partial z_1}\\
\frac{\partial \hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{F}_2}{\partial w_2}\cdot\frac{\partial\hat{\theta}_2}{\partial \tilde{P}_2}\cdot\frac{\partial \tilde{P}_2}{\partial z_2}+\frac{\partial F_2}{\partial z_2}\\
\frac{\partial \hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{F}_2}{\partial w_2}\cdot\frac{\partial\hat{\theta}_2}{\partial \hat{P}_1}\cdot\frac{\partial \hat{P}_1}{\partial w_1}+\frac{\partial \hat{F}_2}{\partial w_1}\\
\frac{\partial \hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= 0
\end{aligned}
$$

36.52.3. Ecuaciones Recursivas

Entonces, de todo lo desarrollado hasta ahora se tienen las siguientes ecuaciones:

$$
\begin{aligned}
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= r_1\mu_1 \\
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= = r_1\tilde{\mu}_2 + f_1(1)\left(\frac{1}{1-\mu_1}\right)\tilde{\mu}_2 + f_1(2) \\
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= r_1\hat{\mu}_1 + f_1(1)\left(\frac{1}{1-\mu_1}\right)\hat{\mu}_1 + \hat{F}^{(1)}_{1,1}(1) \\
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= r_1\hat{\mu}_2 + f_1(1)\left(\frac{1}{1-\mu_1}\right)\hat{\mu}_2 + \hat{F}^{(1)}_{2,1}(1) \\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= r_2\mu_1 + f_2(2)\left(\frac{1}{1-\tilde{\mu}_2}\right)\mu_1 + f_2(1) \\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= r_2\tilde{\mu}_2 \\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= r_2\hat{\mu}_1 + f_2(2)\left(\frac{1}{1-\tilde{\mu}_2}\right)\hat{\mu}_1 + \hat{F}^{(1)}_{2,1}(1) \\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= r_2\hat{\mu}_2 + f_2(2)\left(\frac{1}{1-\tilde{\mu}_2}\right)\hat{\mu}_2 + \hat{F}^{(1)}_{2,2}(1) \\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_1\mu_1 + \hat{f}_1(1)\left(\frac{1}{1-\hat{\mu}_1}\right)\mu_1 + F^{(1)}_{1,1}(1) \\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_1\mu_2 + \hat{f}_1(1)\left(\frac{1}{1-\hat{\mu}_1}\right)\tilde{\mu}_2 + F^{(1)}_{2,1}(1) \\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_1\hat{\mu}_1 \\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_1\hat{\mu}_2 + \hat{f}_1(1)\left(\frac{1}{1-\hat{\mu}_1}\right)\hat{\mu}_2 + \hat{f}_1(2) \\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_2\mu_1 + \hat{f}_2(1)\left(\frac{1}{1-\hat{\mu}_2}\right)\mu_1 + F^{(1)}_{1,2}(1) \\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_2\tilde{\mu}_2 + \hat{f}_2(2)\left(\frac{1}{1-\hat{\mu}_2}\right)\tilde{\mu}_2 + F^{(1)}_{2,2}(1) \\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_2\hat{\mu}_1 + \hat{f}_2(2)\left(\frac{1}{1-\hat{\mu}_2}\right)\hat{\mu}_1 + \hat{f}_2(1) \\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_2\hat{\mu}_2
\end{aligned}
$$

Es decir, se tienen las siguientes ecuaciones:

$$
\begin{aligned}
f_2(1) &= r_1\mu_1 \\
f_1(2) &= r_2\tilde{\mu}_2 \\
f_2(2) &= r_1\tilde{\mu}_2 + \tilde{\mu}_2\left(\frac{f_1(1)}{1-\mu_1}\right) + f_1(2) = \left(r_1 + \frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2 + r_2\tilde{\mu}_2 \\
&= \left(r_1 + r_2 + \frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2 = \left(r + \frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2 \\
f_2(3) &= r_1\hat{\mu}_1 + \hat{\mu}_1\left(\frac{f_1(1)}{1-\mu_1}\right) + \hat{F}^{(1)}_{1,1}(1) = \hat{\mu}_1\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_1}{\mu_1} \\
f_2(4) &= r_1\hat{\mu}_2 + \hat{\mu}_2\left(\frac{f_1(1)}{1-\mu_1}\right) + \hat{F}^{(1)}_{2,1}(1) = \hat{\mu}_2\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_2}{\mu_1} \\
f_1(1) &= r_2\mu_1 + \mu_1\left(\frac{f_2(2)}{1-\tilde{\mu}_2}\right) + r_1\mu_1 = \mu_1\left(r_1 + r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) \\
&= \mu_1\left(r + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) \\
f_1(3) &= r_2\hat{\mu}_1 + \hat{\mu}_1\left(\frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \hat{F}^{(1)}_{1,2}(1) = \hat{\mu}_1\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_1}{\mu_2} \\
f_1(4) &= r_2\hat{\mu}_2 + \hat{\mu}_2\left(\frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \hat{F}^{(1)}_{2,2}(1) = \hat{\mu}_2\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_2}{\mu_2} \\
\hat{f}_1(4) &= \hat{r}_2\hat{\mu}_2 \\
\hat{f}_2(3) &= \hat{r}_1\hat{\mu}_1 \\
\hat{f}_1(1) &= \hat{r}_2\mu_1 + \mu_1\left(\frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right) + F^{(1)}_{1,2}(1) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\mu_1 + \frac{\mu_1}{\hat{\mu}_2} \\
\hat{f}_1(2) &= \hat{r}_2\tilde{\mu}_2 + \tilde{\mu}_2\left(\frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right) + F^{(1)}_{2,2}(1) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\tilde{\mu}_2 + \frac{\mu_2}{\hat{\mu}_2} \\
\hat{f}_1(3) &= \hat{r}_2\hat{\mu}_1 + \hat{\mu}_1\left(\frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right) + \hat{f}_2(3) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 + \hat{r}_1\hat{\mu}_1 \\
&= \left(\hat{r}_1 + \hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 = \left(\hat{r} + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 \\
\hat{f}_2(1) &= \hat{r}_1\mu_1 + \mu_1\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + F^{(1)}_{1,1}(1) = \left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\mu_1 + \frac{\mu_1}{\hat{\mu}_1} \\
\hat{f}_2(2) &= \hat{r}_1\tilde{\mu}_2 + \tilde{\mu}_2\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + F^{(1)}_{2,1}(1) = \left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\tilde{\mu}_2 + \frac{\mu_2}{\hat{\mu}_1} \\
\hat{f}_2(4) &= \hat{r}_1\hat{\mu}_2 + \hat{\mu}_2\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + \hat{f}_1(4) = \hat{r}_1\hat{\mu}_2 + \hat{r}_2\hat{\mu}_2 + \hat{\mu}_2\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) \\
&= \left(\hat{r} + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\hat{\mu}_2
\end{aligned}
$$

es decir,

$$
\begin{array}{lll}
f_1(1) = \mu_1\left(r + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) & f_1(2) = r_2\tilde{\mu}_2 & f_1(3) = \hat{\mu}_1\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_1}{\mu_2} \\
f_1(4) = \hat{\mu}_2\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_2}{\mu_2} & f_2(1) = r_1\mu_1 & f_2(2) = \left(r + \frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2 \\
f_2(3) = \hat{\mu}_1\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_1}{\mu_1} & f_2(4) = \hat{\mu}_2\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_2}{\mu_1} & \hat{f}_1(1) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\mu_1 + \frac{\mu_1}{\hat{\mu}_2} \\
\hat{f}_1(2) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\tilde{\mu}_2 + \frac{\mu_2}{\hat{\mu}_2} & \hat{f}_1(3) = \left(\hat{r} + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 & \hat{f}_1(4) = \hat{r}_2\hat{\mu}_2 \\
\hat{f}_2(1) = \left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\mu_1 + \frac{\mu_1}{\hat{\mu}_1} & \hat{f}_2(2) = \left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\tilde{\mu}_2 + \frac{\mu_2}{\hat{\mu}_1} & \hat{f}_2(3) = \hat{r}_1\hat{\mu}_1 \\
 & \hat{f}_2(4) = \left(\hat{r} + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\hat{\mu}_2 &
\end{array}
$$

36.52.4. Solución del Sistema de Ecuaciones Lineales

A saber, se puede demostrar que la solución del sistema de ecuaciones está dado por las siguientes expresiones, donde

$$\mu = \mu_1 + \tilde{\mu}_2 \ , \ \hat{\mu} = \hat{\mu}_1 + \hat{\mu}_2 \ , \ r = r_1 + r_2 \text{ y } \hat{r} = \hat{r}_1 + \hat{r}_2$$

entonces

$$
\begin{array}{lll}
f_1(1) = r\frac{\mu_1(1-\mu_1)}{1-\mu} & f_1(3) = \hat{\mu}_1\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right) & f_1(4) = \hat{\mu}_2\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right) \\
f_2(2) = r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu} & f_2(3) = \hat{\mu}_1\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right) & f_2(4) = \hat{\mu}_2\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right) \\
\hat{f}_1(1) = \mu_1\left(\frac{\hat{r}_2\hat{\mu}_2+1}{\hat{\mu}_2} + \hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right) & \hat{f}_1(2) = \tilde{\mu}_2\left(\hat{r}_2 + \hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right) + \frac{\mu_2}{\hat{\mu}_2} & \hat{f}_1(3) = \hat{r}\frac{\hat{\mu}_1(1-\hat{\mu}_1)}{1-\hat{\mu}} \\
\hat{f}_2(1) = \mu_1\left(\frac{\hat{r}_1\hat{\mu}_1+1}{\hat{\mu}_1} + \hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right) & \hat{f}_2(2) = \tilde{\mu}_2\left(\hat{r}_1 + \hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right) + \frac{\mu_2}{\hat{\mu}_1} & \hat{f}_2(4) = \hat{r}\frac{\hat{\mu}_2(1-\hat{\mu}_2)}{1-\hat{\mu}}
\end{array}
$$

A saber

$$
\begin{aligned}

$$

36.53. Resultado Principal

Sean $\mu_1, \mu_2, \breve{\mu}_2, \hat{\mu}_1, \hat{\mu}_2$ y $\tilde{\mu}_2 = \mu_2 + \breve{\mu}_2$ los valores esperados de los proceso definidos anteriormente, y sean $r_1, r_2, \hat{r}_1$ y $\hat{r}_2$ los valores esperado s de los tiempos de traslado del servidor entre las colas para cada uno de los sistemas de visitas cíclicas. Si se definen $\mu = \mu_1 + \tilde{\mu}_2$, $\hat{\mu} = \hat{\mu}_1 + \hat{\mu}_2$, y $r = r_1 + r_2$ y $\hat{r} = \hat{r}_1 + \hat{r}_2$, entonces se tiene el siguiente resultado.

Teorema 36.53.1 *Supongamos que $\mu < 1$, $\hat{\mu} < 1$, entonces, el número de usuarios presentes en cada una de las colas que conforman la Red de Sistemas de Visitas Cíclicas cuando uno de los servidores visita a alguna de ellas está dada por la solución del Sistema de Ecuaciones Lineales presentados arriba cuyas expresiones damos a continuación:*

$$\begin{array}{lll}
f_1(1) = r\frac{\mu_1(1-\mu_1)}{1-\mu}, & f_1(2) = r_2\tilde{\mu}_2, & f_1(3) = \hat{\mu}_1\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right), \\
f_1(4) = \hat{\mu}_2\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right), & f_2(1) = r_1\mu_1, & f_2(2) = r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu}, \\
f_2(3) = \hat{\mu}_1\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right), & f_2(4) = \hat{\mu}_2\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right), & \hat{f}_1(1) = \mu_1\left(\frac{\hat{r}_2\hat{\mu}_2+1}{\hat{\mu}_2} + \hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right), \\
\hat{f}_1(2) = \tilde{\mu}_2\left(\hat{r}_2 + \hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right) + \frac{\mu_2}{\hat{\mu}_2}, & \hat{f}_1(3) = \hat{r}\frac{\hat{\mu}_1(1-\hat{\mu}_1)}{1-\hat{\mu}}, & \hat{f}_1(4) = \hat{r}_2\hat{\mu}_2, \\
\hat{f}_2(1) = \mu_1\left(\frac{\hat{r}_1\hat{\mu}_1+1}{\hat{\mu}_1} + \hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right), & \hat{f}_2(2) = \tilde{\mu}_2\left(\hat{r}_1 + \hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right) + \frac{\hat{\mu}_2}{\hat{\mu}_1}, & \hat{f}_2(3) = \hat{r}_1\hat{\mu}_1, \\
 & \hat{f}_2(4) = \hat{r}\frac{\hat{\mu}_2(1-\hat{\mu}_2)}{1-\hat{\mu}}. &
\end{array}$$

36.54. Segundos Momentos

Para poder determinar los segundos momentos para los tiempos de traslado del servidor es necesaria la siguiente proposición:

Proposición 36.54.1 *Sea $f(g(x)h(y))$ función continua tal que tiene derivadas parciales mixtas de segundo orden, entonces se tiene lo siguiente:*

$$\frac{\partial}{\partial x} f(g(x)h(y)) = \frac{\partial f(g(x)h(y))}{\partial x} \cdot \frac{\partial g(x)}{\partial x} \cdot h(y)$$

por tanto

$$\frac{\partial}{\partial x}\frac{\partial}{\partial x} f(g(x)h(y)) = \frac{\partial^2}{\partial x} f(g(x)h(y)) \cdot \left(\frac{\partial g(x)}{\partial x}\right)^2 \cdot h^2(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g^2(x)}{\partial x^2} \cdot h(y) \quad (36.54.1)$$

y

$$\frac{\partial}{\partial y}\frac{\partial}{\partial x} f(g(x)h(y)) = \frac{\partial g(x)}{\partial x} \cdot \frac{\partial h(y)}{\partial y}\left\{\frac{\partial^2}{\partial y \partial x} f(g(x)h(y)) \cdot g(x) \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y))\right\}$$

Demostración 36.54.1

$$\begin{aligned}
\frac{\partial}{\partial x}\frac{\partial}{\partial x} f(g(x)h(y)) &= \frac{\partial}{\partial x}\left\{\frac{\partial f(g(x)h(y))}{\partial x} \cdot \frac{\partial g(x)}{\partial x} \cdot h(y)\right\} \\
&= \frac{\partial}{\partial x}\left\{\frac{\partial}{\partial x} f(g(x)h(y))\right\} \cdot \frac{\partial g(x)}{\partial x} \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g^2(x)}{\partial x^2} \cdot h(y) \\
&= \frac{\partial^2}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g(x)}{\partial x} \cdot h(y) \cdot \frac{\partial g(x)}{\partial x} \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g^2(x)}{\partial x^2} \cdot h(y) \\
&= \frac{\partial^2}{\partial x} f(g(x)h(y)) \cdot \left(\frac{\partial g(x)}{\partial x}\right)^2 \cdot h^2(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g^2(x)}{\partial x^2} \cdot h(y).
\end{aligned}$$

Por otra parte:

$$\begin{aligned}
\frac{\partial}{\partial y}\frac{\partial}{\partial x} f(g(x)h(y)) &= \frac{\partial}{\partial y}\left\{\frac{\partial f(g(x)h(y))}{\partial x} \cdot \frac{\partial g(x)}{\partial x} \cdot h(y)\right\} \\
&= \frac{\partial}{\partial y}\left\{\frac{\partial}{\partial x} f(g(x)h(y))\right\} \cdot \frac{\partial g(x)}{\partial x} \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g(x)}{\partial x} \cdot \frac{\partial h(y)}{y} \\
&= \frac{\partial^2}{\partial y \partial x} f(g(x)h(y)) \cdot \frac{\partial h(y)}{\partial y} \cdot g(x) \cdot \frac{\partial g(x)}{\partial x} \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g(x)}{\partial x} \cdot \frac{\partial h(y)}{\partial y} \\
&= \frac{\partial g(x)}{\partial x} \cdot \frac{\partial h(y)}{\partial y}\left\{\frac{\partial^2}{\partial y \partial x} f(g(x)h(y)) \cdot g(x) \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y))\right\}
\end{aligned}$$

Utilizando la proposición anterior (Proposiciíon 36.85.1)se tiene el siguiente resultado que me dice como calcular los segundos momentos para los procesos de traslado del servidor:

Proposición 36.54.2 *Sea R_i la Función Generadora de Probabilidades para el número de arribos a cada una de las colas de la Red de Sistemas de Visitas Cíclicas definidas como en (36.84.4). Entonces las derivadas parciales están dadas por las siguientes expresiones:*

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_i^2} &= \left(\frac{\partial P_i(z_i)}{\partial z_i}\right)^2\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial^2 z_i}\\ &+ \left(\frac{\partial P_i(z_i)}{\partial z_i}\right)^2\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_i}\end{aligned}$$

y además

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_2\partial z_1} &= \frac{\partial\tilde{P}_2(z_2)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_2\partial z_1}\\ &+ \frac{\partial\tilde{P}_2(z_2)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_1},\end{aligned}$$

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_1} &= \frac{\partial\hat{P}_i(w_i)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_1}\\ &+ \frac{\partial\hat{P}_i(w_i)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_1},\end{aligned}$$

finalmente

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_2} &= \frac{\partial\hat{P}_i(w_i)}{\partial w_i}\cdot\frac{\partial\tilde{P}_2(z_2)}{\partial z_2}\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_2}\\ &+ \frac{\partial\hat{P}_i(w_i)}{\partial w_i}\cdot\frac{\partial\tilde{P}_2(z_2)}{\partial z_1}\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_2},\end{aligned}$$

para $i = 1, 2$.

36.54.1. Sistema de Ecuaciones Lineales para los Segundos Momentos

En el apéndice (36.67) se demuestra que las ecuaciones para las ecuaciones parciales mixtas están dadas por:

$$\begin{aligned}f_1(1,1) &= r_2P_1^{(2)}(1)+\mu_1^2R_2^{(2)}(1)+2\mu_1r_2\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right)+\frac{1}{1-\tilde{\mu}_2}P_1^{(2)}f_2(2)+\mu_1^2\tilde{\theta}_2^{(2)}(1)f_2(2)\\ &+ \frac{\mu_1}{1-\tilde{\mu}_2}f_2(1,2)+\frac{\mu_1}{1-\tilde{\mu}_2}\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2,2)+f_2(1,2)\right)+f_2(1,1),\\ f_1(2,1) &= \mu_1r_2\tilde{\mu}_2+\mu_1\tilde{\mu}_2R_2^{(2)}(1)+r_2\tilde{\mu}_2\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right),\\ f_1(3,1) &= \mu_1\hat{\mu}_1r_2+\mu_1\hat{\mu}_1R_2^{(2)}(1)+r_2\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+r_2\hat{\mu}_1\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right)+\mu_1r_2\hat{F}_{2,1}^{(1)}(1)\\ &+ \left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right)\hat{F}_{2,1}^{(1)}(1)+\frac{\mu_1\hat{\mu}_1}{1-\tilde{\mu}_2}f_2(2)+\mu_1\hat{\mu}_1\tilde{\theta}_2^{(2)}(1)f_2(2)+\mu_1\hat{\mu}_1\left(\frac{1}{1-\tilde{\mu}_2}\right)^2f_2(2,2)\\ &+ +\frac{\hat{\mu}_1}{1-\tilde{\mu}_2}f_2(1,2),\\ f_1(4,1) &= \mu_1\hat{\mu}_2r_2+\mu_1\hat{\mu}_2R_2^{(2)}(1)+r_2\frac{\mu_1\hat{\mu}_2}{1-\tilde{\mu}_2}f_2(2)+\mu_1r_2\hat{F}_{2,2}^{(1)}(1)+r_2\hat{\mu}_2\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right)\\ &+ \hat{F}_{2,1}^{(1)}(1)\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right)+\frac{\mu_1\hat{\mu}_2}{1-\tilde{\mu}_2}f_2(2)+\mu_1\hat{\mu}_2\tilde{\theta}_2^{(2)}(1)f_2(2)+\mu_1\hat{\mu}_2\left(\frac{1}{1-\tilde{\mu}_2}\right)^2f_2(2,2)\\ &+ \frac{\hat{\mu}_2}{1-\tilde{\mu}_2}f_2^{(1,2)},\end{aligned}$$

$$
\begin{aligned}

36.55. Medidas de Desempeño

Definición 36.55.1 *Sea L_i^* el número de usuarios cuando el servidor visita la cola Q_i para dar servicio, para $i = 1, 2$.*

Entonces

Proposición 36.55.1 *Para la cola Q_i, $i = 1, 2$, se tiene que el número de usuarios presentes al momento de ser visitada por el servidor está dado por*

$$\mathbb{E}[L_i^*] = f_i(i) \tag{36.55.1}$$

$$Var[L_i^*] = f_i(i,i) + \mathbb{E}[L_i^*] - \mathbb{E}[L_i^*]^2. \tag{36.55.2}$$

Definición 36.55.2 *El tiempo de Ciclo C_i es el periodo de tiempo que comienza cuando la cola i es visitada por primera vez en un ciclo, y termina cuando es visitado nuevamente en el próximo ciclo, bajo condiciones de estabilidad.*

$$C_i(z) = \mathbb{E}\left[z^{\overline{\tau}_i(m+1) - \overline{\tau}_i(m)}\right]$$

Definición 36.55.3 *El tiempo de intervisita I_i es el periodo de tiempo que comienza cuando se ha completado el servicio en un ciclo y termina cuando es visitada nuevamente en el próximo ciclo.*

$$I_i(z) = \mathbb{E}\left[z^{\tau_i(m+1)-\overline{\tau}_i(m)}\right]$$

Proposición 36.55.2 *Para los tiempos de intervisita del servidor I_i, se tiene que*

$$\begin{aligned}
\mathbb{E}[I_i] &= \frac{f_i(i)}{\mu_i}, \\
Var[I_i] &= \frac{Var\left[L_i^*\right]}{\mu_i^2} - \frac{\sigma_i^2}{\mu_i^2} f_i(i).
\end{aligned}$$

Proposición 36.55.3 *Para los tiempos que ocupa el servidor para atender a los usuarios presentes en la cola Q_i, con FGP denotada por S_i, se tiene que*

$$\begin{aligned}
\mathbb{E}[S_i] &= \frac{\mathbb{E}\left[L_i^*\right]}{1-\mu_i} = \frac{f_i(i)}{1-\mu_i}, \\
Var[S_i] &= \frac{Var\left[L_i^*\right]}{(1-\mu_i)^2} + \frac{\sigma^2 \mathbb{E}\left[L_i^*\right]}{(1-\mu_i)^3}
\end{aligned}$$

Proposición 36.55.4 *Para la duración de los ciclos C_i se tiene que*

$$\begin{aligned}
\mathbb{E}[C_i] &= \mathbb{E}[I_i]\,\mathbb{E}[\theta_i(z)] = \frac{\mathbb{E}\left[L_i^*\right]}{\mu_i}\frac{1}{1-\mu_i} = \frac{f_i(i)}{\mu_i(1-\mu_i)} \\
Var[C_i] &= \frac{Var\left[L_i^*\right]}{\mu_i^2(1-\mu_i)^2}.
\end{aligned}$$

\end{aligned}$$

15.

$$\begin{aligned}
&\frac{\partial}{\partial w_1}\frac{\partial}{\partial w_2}\left(\hat{R}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)\hat{F}_1\left(\hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right),w_2\right)F_1(z_1,z_2)\right)\\
=\;& \hat{r}_1\hat{\mu}_2\hat{\mu}_1+\hat{\mu}_2\hat{\mu}_1\hat{R}_1^{(2)}(1)+\hat{r}_1\hat{\mu}_1\left(\hat{F}_1^{(0,1)}+\frac{\hat{\mu}_2}{1-\hat{\mu}_1}\hat{F}_1^{(1,0)}\right).
\end{aligned}$$

16.

$$\begin{aligned}
&\frac{\partial}{\partial w_2}\frac{\partial}{\partial w_2}\left(\hat{R}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)\hat{F}_1\left(\hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right),w_2\right)F_1(z_1,z_2)\right)\\
=\;& \hat{r}_1\hat{P}_2^{(2)}(1)+\hat{\mu}_2^2\hat{R}_1^{(2)}(1)+2\hat{r}_1\hat{\mu}_2\left(\hat{F}_1^{(0,1)}+\frac{\hat{\mu}_2}{1-\hat{\mu}_1}\hat{F}_1^{(1,0)}\right)+\hat{F}_1^{(0,2)}+\frac{1}{1-\hat{\mu}_1}\hat{P}_2^{(2)}(1)\hat{F}_1^{(1,0)}\\
+\;& \hat{\mu}_2^2\hat{\theta}_1^{(2)}(1)\hat{F}_1^{(1,0)}+\frac{\hat{\mu}_2}{1-\hat{\mu}_1}\hat{F}_1^{(1,1)}+\frac{\hat{\mu}_2}{1-\hat{\mu}_1}\left(\hat{F}_1^{(1,1)}+\frac{\hat{\mu}_2}{1-\hat{\mu}_1}\hat{F}_1^{(2,0)}\right).
\end{aligned}$$

Las ecuaciones que determinan los segundos momentos de las longitudes de las colas de los dos sistemas se pueden ver en este sitio

Apéndice B

Distribución para los usuarios de traslado

Se puede demostrar que

$$\frac{d^k}{dy}\left(\frac{\lambda+\mu}{\lambda+\mu-y}\right)=\frac{k!}{(\lambda+\mu)^k} \tag{36.55.3}$$

Proposición 36.55.5 *Sea τ variable aleatoria no negativa con distribución exponencial con media μ, y sea $L(t)$ proceso Poisson con parámetro λ. Entonces*

$$\mathbb{P}\{L(\tau)=k\}=f_{L(\tau)}(k)=\left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)^{k}. \tag{36.55.4}$$

Además

$$\mathbb{E}[L(\tau)] = \frac{\lambda}{\mu} \tag{36.55.5}$$

$$\mathbb{E}\left[(L(\tau))^2\right] = \frac{\lambda}{\mu}\left(2\frac{\lambda}{\mu}+1\right) \tag{36.55.6}$$

$$V[L(\tau)] = \frac{\lambda}{\mu}\left(\frac{\lambda}{\mu}+1\right). \tag{36.55.7}$$

A saber, para k fijo se tiene que

$$\begin{aligned}
\mathbb{P}\{L(\tau)=k\} &= \mathbb{P}\{L(\tau)=k,\tau\in(0,\infty)\}\\
&= \int_0^\infty \mathbb{P}\{L(\tau)=k,\tau=y\}f_\tau(y)\,dy=\int_0^\infty \mathbb{P}\{L(y)=k\}f_\tau(y)\,dy\\
&= \int_0^\infty \frac{e^{-\lambda y}}{k!}(\lambda y)^k\left(\mu e^{-\mu y}\right)dy=\frac{\lambda^k\mu}{k!}\int_0^\infty y^k e^{-(\mu+\lambda)y}dy\\
&= \frac{\lambda^k\mu}{(\lambda+\mu)\,k!}\int_0^\infty y^k(\lambda+\mu)\,e^{-(\lambda+\mu)y}dy=\frac{\lambda^k\mu}{(\lambda+\mu)\,k!}\int_0^\infty y^k f_Y(y)\,dy\\
&= \frac{\lambda^k\mu}{(\lambda+\mu)\,k!}\mathbb{E}\left[Y^k\right]=\frac{\lambda^k\mu}{(\lambda+\mu)\,k!}\frac{d^k}{dy}\left(\frac{\lambda+\mu}{\lambda+\mu-y}\right)|_{y=0}\\
&= \frac{\lambda^k\mu}{(\lambda+\mu)\,k!}\frac{k!}{(\lambda+\mu)^k}=\left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)^k.
\end{aligned}$$

Además

$$\begin{aligned}
\sum_{k=0}^\infty \mathbb{P}\{L(\tau)=k\} &= \sum_{k=0}^\infty\left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)^k=\frac{\mu}{\lambda+\mu}\sum_{k=0}^\infty\left(\frac{\lambda}{\lambda+\mu}\right)^k\\
&= \frac{\mu}{\lambda+\mu}\left(\frac{1}{1-\frac{\lambda}{\lambda+\mu}}\right)=\frac{\mu}{\lambda+\mu}\left(\frac{\lambda+\mu}{\mu}\right)\\
&= 1.
\end{aligned}$$

determinemos primero la esperanza de $L(\tau)$:

$$\begin{aligned}
\mathbb{E}[L(\tau)] &= \sum_{k=0}^\infty k\mathbb{P}\{L(\tau)=k\}=\sum_{k=0}^\infty k\left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)^k\\
&= \left(\frac{\mu}{\lambda+\mu}\right)\sum_{k=0}^\infty k\left(\frac{\lambda}{\lambda+\mu}\right)^k=\left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)\sum_{k=1}^\infty k\left(\frac{\lambda}{\lambda+\mu}\right)^{k-1}\\
&= \frac{\mu\lambda}{(\lambda+\mu)^2}\left(\frac{1}{1-\frac{\lambda}{\lambda+\mu}}\right)^2=\frac{\mu\lambda}{(\lambda+\mu)^2}\left(\frac{\lambda+\mu}{\mu}\right)^2\\
&= \frac{\lambda}{\mu}.
\end{aligned}$$

Ahora su segundo momento:

$$\begin{aligned}
\mathbb{E}\left[(L(\tau))^2\right] &= \sum_{k=0}^{\infty} k^2 \mathbb{P}\{L(\tau)=k\} = \sum_{k=0}^{\infty} k^2 \left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)^k \\
&= \left(\frac{\mu}{\lambda+\mu}\right)\sum_{k=0}^{\infty} k^2 \left(\frac{\lambda}{\lambda+\mu}\right)^k = \frac{\mu\lambda}{(\lambda+\mu)^2}\sum_{k=2}^{\infty}(k-1)^2\left(\frac{\lambda}{\lambda+\mu}\right)^{k-2} \\
&= \frac{\mu\lambda}{(\lambda+\mu)^2}\left(\frac{\frac{\lambda}{\lambda+\mu}+1}{\left(\frac{\lambda}{\lambda+\mu}-1\right)^3}\right) = \frac{\mu\lambda}{(\lambda+\mu)^2}\left(-\frac{\frac{2\lambda+\mu}{\lambda+\mu}}{\left(-\frac{\mu}{\lambda+\mu}\right)^3}\right) \\
&= \frac{\mu\lambda}{(\lambda+\mu)^2}\left(\frac{2\lambda+\mu}{\lambda+\mu}\right)\left(\frac{\lambda+\mu}{\mu}\right)^3 = \frac{\lambda(2\lambda+\mu)}{\mu^2} \\
&= \frac{\lambda}{\mu}\left(2\frac{\lambda}{\mu}+1\right).
\end{aligned}$$

y por tanto

$$\begin{aligned}
V[L(\tau)] &= \frac{\lambda(2\lambda+\mu)}{\mu^2} - \left(\frac{\lambda}{\mu}\right)^2 = \frac{\lambda^2+\mu\lambda}{\mu^2} \\
&= \frac{\lambda}{\mu}\left(\frac{\lambda}{\mu}+1\right).
\end{aligned}$$

Ahora, determinemos la distribución del número de usuarios que pasan de $\hat{Q}_2$ a Q_2 considerando dos políticas de traslado en específico:

1. Solamente pasa un usuario,
2. Se permite el paso de k usuarios,

una vez que son atendidos por el servidor en $\hat{Q}_2$.

Política de un solo usuario: Sea R_2 el número de usuarios que llegan a $\hat{Q}_2$ al tiempo t, sea R_1 el número de usuarios que pasan de $\hat{Q}_2$ a Q_2 al tiempo t.

A saber:

$$\begin{aligned}
\mathbb{E}[R_1] &= \sum_{y\geq 0}\mathbb{P}[R_2=y]\,\mathbb{E}[R_1|R_2=y] \\
&= \sum_{y\geq 0}\mathbb{P}[R_2=y]\sum_{x\geq 0} x\mathbb{P}[R_1=x|R_2=y] \\
&= \sum_{y\geq 0}\sum_{x\geq 0} x\mathbb{P}[R_1=x|R_2=y]\,\mathbb{P}[R_2=y].
\end{aligned}$$

Determinemos

$$\mathbb{E}[R_1|R_2=y] = \sum_{x\geq 0} x\mathbb{P}[R_1=x|R_2=y]. \tag{36.55.8}$$

supongamos que $y=0$, entonces

$$\begin{aligned}
\mathbb{P}[R_1=0|R_2=0] &= 1, \\
\mathbb{P}[R_1=x|R_2=0] &= 0, \text{ para cualquier } x\geq 1,
\end{aligned}$$

por tanto

$$\mathbb{E}[R_1|R_2=0]=0.$$

Para $y=1$,

$$\begin{aligned}
\mathbb{P}[R_1=0|R_2=1] &= 0, \\
\mathbb{P}[R_1=1|R_2=1] &= 1,
\end{aligned}$$

entonces

$$\mathbb{E}[R_1|R_2=1]=1.$$

Para $y > 1$:

$$\begin{aligned}\mathbb{P}\left[R_1 = 0 | R_2 \geq 1\right] &= 0,\\ \mathbb{P}\left[R_1 = 1 | R_2 \geq 1\right] &= 1,\\ \mathbb{P}\left[R_1 > 1 | R_2 \geq 1\right] &= 0,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1 | R_2 = y\right] = 1, \text{ para cualquier } y > 1.$$

es decir

$$\mathbb{E}\left[R_1 | R_2 = y\right] = 1, \text{ para cualquier } y \geq 1.$$

Entonces

$$\begin{aligned}\mathbb{E}\left[R_1\right] &= \sum_{y\geq 0}\sum_{x\geq 0} x\mathbb{P}\left[R_1 = x | R_2 = y\right]\mathbb{P}\left[R_2 = y\right] = \sum_{y\geq 0}\sum_{x} \mathbb{E}\left[R_1 | R_2 = y\right]\mathbb{P}\left[R_2 = y\right]\\ &= \sum_{y\geq 0}\mathbb{P}\left[R_2 = y\right] = \sum_{y\geq 1}\frac{(\lambda t)^k}{k!}e^{-\lambda t} = 1.\end{aligned}$$

Además para $k \in Z^+$

$$\begin{aligned}f_{R_1}(k) &= \mathbb{P}\left[R_1 = k\right] = \sum_{n=0}^{\infty}\mathbb{P}\left[R_1 = k | R_2 = n\right]\mathbb{P}\left[R_2 = n\right]\\ &= \mathbb{P}\left[R_1 = k | R_2 = 0\right]\mathbb{P}\left[R_2 = 0\right] + \mathbb{P}\left[R_1 = k | R_2 = 1\right]\mathbb{P}\left[R_2 = 1\right]\\ &+ \mathbb{P}\left[R_1 = k | R_2 > 1\right]\mathbb{P}\left[R_2 > 1\right],\end{aligned}$$

donde para

$k = 0$**:**

$$\begin{aligned}\mathbb{P}\left[R_1 = 0\right] = \mathbb{P}\left[R_1 = 0 | R_2 = 0\right]\mathbb{P}\left[R_2 = 0\right] + \mathbb{P}\left[R_1 = 0 | R_2 = 1\right]\mathbb{P}\left[R_2 = 1\right]\\ + \mathbb{P}\left[R_1 = 0 | R_2 > 1\right]\mathbb{P}\left[R_2 > 1\right] = \mathbb{P}\left[R_2 = 0\right].\end{aligned}$$

$k = 1$**:**

$$\begin{aligned}\mathbb{P}\left[R_1 = 1\right] = \mathbb{P}\left[R_1 = 1 | R_2 = 0\right]\mathbb{P}\left[R_2 = 0\right] + \mathbb{P}\left[R_1 = 1 | R_2 = 1\right]\mathbb{P}\left[R_2 = 1\right]\\ + \mathbb{P}\left[R_1 = 1 | R_2 > 1\right]\mathbb{P}\left[R_2 > 1\right] = \sum_{n=1}^{\infty}\mathbb{P}\left[R_2 = n\right].\end{aligned}$$

$k = 2$**:**

$$\begin{aligned}\mathbb{P}\left[R_1 = 2\right] = \mathbb{P}\left[R_1 = 2 | R_2 = 0\right]\mathbb{P}\left[R_2 = 0\right] + \mathbb{P}\left[R_1 = 2 | R_2 = 1\right]\mathbb{P}\left[R_2 = 1\right]\\ + \mathbb{P}\left[R_1 = 2 | R_2 > 1\right]\mathbb{P}\left[R_2 > 1\right] = 0.\end{aligned}$$

$k = j$**:**

$$\begin{aligned}\mathbb{P}\left[R_1 = j\right] = \mathbb{P}\left[R_1 = j | R_2 = 0\right]\mathbb{P}\left[R_2 = 0\right] + \mathbb{P}\left[R_1 = j | R_2 = 1\right]\mathbb{P}\left[R_2 = 1\right]\\ + \mathbb{P}\left[R_1 = j | R_2 > 1\right]\mathbb{P}\left[R_2 > 1\right] = 0.\end{aligned}$$

Por lo tanto

$$\begin{aligned}f_{R_1}(0) &= \mathbb{P}\left[R_2 = 0\right]\\ f_{R_1}(1) &= \sum_{n\geq 1}^{\infty}\mathbb{P}\left[R_2 = n\right]\\ f_{R_1}(j) &= 0, \text{ para } j > 1.\end{aligned}$$

Política de k usuarios: Al igual que antes, para $y \in Z^+$ fijo

$$\mathbb{E}\left[R_1 | R_2 = y\right] = \sum_{x} x\mathbb{P}\left[R_1 = x | R_2 = y\right].$$

Entonces, si tomamos diversos valore para y:

$y = 0$:

$$\begin{aligned}\mathbb{P}\left[R_1 = 0 | R_2 = 0\right] &= 1,\\ \mathbb{P}\left[R_1 = x | R_2 = 0\right] &= 0, \text{ para cualquier } x \geq 1,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=0\right]=0.$$

Para $y=1$,

$$\begin{aligned}\mathbb{P}\left[R_1=0|R_2=1\right] &= 0,\\ \mathbb{P}\left[R_1=1|R_2=1\right] &= 1,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=1\right]=1.$$

Para $y=2$,

$$\begin{aligned}\mathbb{P}\left[R_1=0|R_2=2\right] &= 0,\\ \mathbb{P}\left[R_1=1|R_2=2\right] &= 1,\\ \mathbb{P}\left[R_1=2|R_2=2\right] &= 1,\\ \mathbb{P}\left[R_1=3|R_2=2\right] &= 0,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=2\right]=3.$$

Para $y=3$,

$$\begin{aligned}\mathbb{P}\left[R_1=0|R_2=3\right] &= 0,\\ \mathbb{P}\left[R_1=1|R_2=3\right] &= 1,\\ \mathbb{P}\left[R_1=2|R_2=3\right] &= 1,\\ \mathbb{P}\left[R_1=3|R_2=3\right] &= 1,\\ \mathbb{P}\left[R_1=4|R_2=3\right] &= 0,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=3\right]=6.$$

En general, para $k\geq 0$,

$$\begin{aligned}\mathbb{P}\left[R_1=0|R_2=k\right] &= 0,\\ \mathbb{P}\left[R_1=j|R_2=k\right] &= 1,\ \text{para } 1\leq j\leq k,\\ \mathbb{P}\left[R_1=j|R_2=k\right] &= 0,\ \text{para } j>k,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=k\right]=\frac{k\left(k+1\right)}{2}.$$

Por lo tanto

$$\begin{aligned}\mathbb{E}\left[R_1\right] &= \sum_{y}\mathbb{E}\left[R_1|R_2=y\right]\mathbb{P}\left[R_2=y\right]\\ &= \sum_{y}\mathbb{P}\left[R_2=y\right]\frac{y\left(y+1\right)}{2}=\sum_{y\geq 1}\left(\frac{y\left(y+1\right)}{2}\right)\frac{\left(\lambda t\right)^{y}}{y!}e^{-\lambda t}\\ &= \frac{\lambda t}{2}e^{-\lambda t}\sum_{y\geq 1}\left(y+1\right)\frac{\left(\lambda t\right)^{y-1}}{\left(y-1\right)!}=\frac{\lambda t}{2}e^{-\lambda t}\left(e^{\lambda t}\left(\lambda t+2\right)\right)\\ &= \frac{\lambda t\left(\lambda t+2\right)}{2},\end{aligned}$$

es decir,

$$\mathbb{E}\left[R_1\right]=\frac{\lambda t\left(\lambda t+2\right)}{2}. \tag{36.55.9}$$

Además para $k\in Z^{+}$ fijo

$$\begin{aligned}f_{R_1}\left(k\right) &= \mathbb{P}\left[R_1=k\right]=\sum_{n=0}^{\infty}\mathbb{P}\left[R_1=k|R_2=n\right]\mathbb{P}\left[R_2=n\right]\\ &= \mathbb{P}\left[R_1=k|R_2=0\right]\mathbb{P}\left[R_2=0\right]+\mathbb{P}\left[R_1=k|R_2=1\right]\mathbb{P}\left[R_2=1\right]\\ &+ \mathbb{P}\left[R_1=k|R_2=2\right]\mathbb{P}\left[R_2=2\right]+\cdots+\mathbb{P}\left[R_1=k|R_2=j\right]\mathbb{P}\left[R_2=j\right]+\cdots+\end{aligned}$$

donde para

$k = 0$:

$$\begin{aligned}\mathbb{P}[R_1 = 0] = \mathbb{P}[R_1 = 0|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = 0|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = 0|R_2 = j]\,\mathbb{P}[R_2 = j] = \mathbb{P}[R_2 = 0].\end{aligned}$$

$k = 1$:

$$\begin{aligned}\mathbb{P}[R_1 = 1] = \mathbb{P}[R_1 = 1|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = 1|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = 1|R_2 = 1]\,\mathbb{P}[R_2 = 1] + \cdots + \mathbb{P}[R_1 = 1|R_2 = j]\,\mathbb{P}[R_2 = j] \\ = \sum_{n=1}^{\infty} \mathbb{P}[R_2 = n].\end{aligned}$$

$k = 2$:

$$\begin{aligned}\mathbb{P}[R_1 = 2] = \mathbb{P}[R_1 = 2|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = 2|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = 2|R_2 = 2]\,\mathbb{P}[R_2 = 2] + \cdots + \mathbb{P}[R_1 = 2|R_2 = j]\,\mathbb{P}[R_2 = j] \\ = \sum_{n=2}^{\infty} \mathbb{P}[R_2 = n].\end{aligned}$$

En general

$$\begin{aligned}\mathbb{P}[R_1 = k] = \mathbb{P}[R_1 = k|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = k|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = k|R_2 = 2]\,\mathbb{P}[R_2 = 2] + \cdots + \mathbb{P}[R_1 = k|R_2 = k]\,\mathbb{P}[R_2 = k] \\ = \sum_{n=k}^{\infty} \mathbb{P}[R_2 = n].\end{aligned}$$

Por lo tanto

$$f_{R_1}(k) \quad = \quad \mathbb{P}[R_1 = k] = \sum_{n=k}^{\infty} \mathbb{P}[R_2 = n].$$

Objetivos Principales

- Encontrar las ecuaciones que modelan el comportamiento de una Red de Sistemas de Visitas Cíclicas (RSVC) con propiedades similares.
- Encontrar expresiones analíticas para las longitudes de las colas al momento en que el servidor llega a una de ellas para comenzar a dar servicio, así como de sus segundos momentos.
- Determinar las principales medidas de Desempeño para la RSVC tales como: Número de usuarios presentes en cada una de las colas del sistema cuando uno de los servidores está presente atendiendo, Tiempos que transcurre entre las visitas del servidor a la misma cola.

36.56. Descripción de una Red de Sistemas de Visitas Cíclicas

Consideremos una red de sistema de visitas cíclicas conformada por dos sistemas de visitas cíclicas, cada una con dos colas independientes, donde además se permite el intercambio de usuarios entre los dos sistemas en la segunda cola de cada uno de ellos.

Supóngase además que los arribos de los usuarios ocurren conforme a un proceso Poisson con tasa de llegada μ_1 y μ_2 para el sistema 1, mientras que para el sistema 2, lo hacen conforme a un proceso Poisson con tasa $\hat{\mu}_1, \hat{\mu}_2$ respectivamente.

El traslado de un sistema a otro ocurre de manera que los tiempos entre llegadas de los usuarios a la cola dos del sistema 1 provenientes del sistema 2, se distribuye de manera exponencial con parámetro $\check{\mu}_2$.

Se considerarán intervalos de tiempo de la forma $[t, t+1]$. Los usuarios arriban por paquetes de manera independiente del resto de las colas. Se define el grupo de usuarios que llegan a cada una de las colas del sistema 1, caracterizadas por Q_1 y Q_2 respectivamente, en el intervalo de tiempo $[t, t+1]$ por $X_1(t), X_2(t)$. De igual manera se definen los procesos $\hat{X}_1(t), \hat{X}_2(t)$ para las colas del sistema 2, denotadas por $\hat{Q}_1$ y $\hat{Q}_2$ respectivamente.

Para el número de usuarios que se trasladan del sistema 2 al sistema 1, de la cola $\hat{Q}_2$ a la cola Q_2, en el intervalo de tiempo $[t, t+1]$, se define el proceso $Y_2(t)$.

El uso de la Función Generadora de Probabilidades (FGP's) nos permite determinar las Funciones de Distribución de Probabilidades Conjunta de manera indirecta sin necesidad de hacer uso de las propiedades de las distribuciones de probabilidad de cada uno de los procesos que intervienen en la Red de Sistemas de Visitas Cíclicas.

En lo que respecta al servidor, en términos de los tiempos de visita a cada una de las colas, se definen las variables aleatorias τ_1, τ_2 para Q_1, Q_2 respectivamente; y ζ_1, ζ_2 para $\hat{Q}_1, \hat{Q}_2$ del sistema 2. A los tiempos en que el servidor termina de atender en las colas $Q_1, Q_2, \hat{Q}_1, \hat{Q}_2$, se les denotará por $\overline{\tau}_1, \overline{\tau}_2, \overline{\zeta}_1, \overline{\zeta}_2$ respectivamente.

Los tiempos de traslado del servidor desde el momento en que termina de atender a una cola y llega a la siguiente para comenzar a dar servicio están dados por $\tau_2 - \overline{\tau}_1, \tau_1 - \overline{\tau}_2$ y $\zeta_2 - \overline{\zeta}_1, \zeta_1 - \overline{\zeta}_2$ para el sistema 1 y el sistema 2, respectivamente.

Cada uno de estos procesos con su respectiva FGP. Además, para cada una de las colas en cada sistema, el número de usuarios al tiempo en que llega el servidor a dar servicio está dado por el número de usuarios presentes en la cola al tiempo t, más el número de usuarios que llegan a la cola en el intervalo de tiempo $[\tau_i, \overline{\tau}_i]$.

Una vez definidas las Funciones Generadoras de Probabilidades Conjuntas se construyen las ecuaciones recursivas que permiten obtener la información sobre la longitud de cada una de las colas, al momento en que uno de los servidores llega a una de las colas para dar servicio, basándose en la información que se tiene sobre su llegada a la cola inmediata anterior.

36.56.1. Funciones Generadoras de Probabilidades

Para cada uno de los procesos de llegada a las colas $X_1, X_2, \hat{X}_1, \hat{X}_2$ y Y_2, con $\tilde{X}_2 = X_2 + Y_2$ anteriores se define su Función Generadora de Probabilidades (FGP):

$$\begin{aligned} P_1(z_1) &= \mathbb{E}\left[z_1^{X_1(t)}\right], & P_2(z_2) &= \mathbb{E}\left[z_2^{X_2(t)}\right], & \check{P}_2(z_2) &= \mathbb{E}\left[z_2^{Y_2(t)}\right], \\ \hat{P}_1(w_1) &= \mathbb{E}\left[w_1^{\hat{X}_1(t)}\right], & \hat{P}_2(w_2) &= \mathbb{E}\left[w_2^{\hat{X}_2(t)}\right], & \tilde{P}_2(z_2) &= \mathbb{E}\left[z_2^{\tilde{X}_2(t)}\right]. \end{aligned}$$

Con primer momento definidos por

$$\begin{aligned} \mu_1 &= \mathbb{E}[X_1(t)] = P_1^{(1)}(1), & \mu_2 &= \mathbb{E}[X_2(t)] = P_2^{(1)}(1), \\ \check{\mu}_2 &= \mathbb{E}[Y_2(t)] = \check{P}_2^{(1)}(1), & \hat{\mu}_1 &= \mathbb{E}\left[\hat{X}_1(t)\right] = \hat{P}_1^{(1)}(1), \\ \hat{\mu}_2 &= \mathbb{E}\left[\hat{X}_2(t)\right] = \hat{P}_2^{(1)}(1), & \tilde{\mu}_2 &= \mathbb{E}\left[\tilde{X}_2(t)\right] = \tilde{P}_2^{(1)}(1). \end{aligned}$$

En lo que respecta al servidor, en términos de los tiempos de visita a cada una de las colas, se denotarán por $B_1(t), B_2(t)$ los procesos correspondientes a las variables aleatorias τ_1, τ_2 para Q_1, Q_2 respectivamente; y $\hat{B}_1(t), \hat{B}_2(t)$ con parámetros ζ_1, ζ_2 para $\hat{Q}_1, \hat{Q}_2$ del sistema 2. Y a los tiempos en que el servidor termina de atender en las colas $Q_1, Q_2, \hat{Q}_1, \hat{Q}_2$, se les denotará por $\overline{\tau}_1, \overline{\tau}_2, \overline{\zeta}_1, \overline{\zeta}_2$ respectivamente. Entonces, los tiempos de servicio están dados por las diferencias $\overline{\tau}_1 - \tau_1, \overline{\tau}_2 - \tau_2$ para Q_1, Q_2, y $\overline{\zeta}_1 - \zeta_1, \overline{\zeta}_2 - \zeta_2$ para $\hat{Q}_1, \hat{Q}_2$ respectivamente.

Sus procesos se definen por:

$$\begin{aligned} S_1(z_1) &= \mathbb{E}\left[z_1^{\overline{\tau}_1 - \tau_1}\right], & S_2(z_2) &= \mathbb{E}\left[z_1^{\overline{\tau}_2 - \tau_2}\right], \\ \hat{S}_1(w_1) &= \mathbb{E}\left[w_1^{\overline{\zeta}_1 - \zeta_1}\right], & \hat{S}_2(w_2) &= \mathbb{E}\left[w_2^{\overline{\zeta}_2 - \zeta_2}\right], \end{aligned}$$

con primer momento dado por:

$$s_1 = \mathbb{E}[\overline{\tau}_1 - \tau_1], \quad s_2 = \mathbb{E}[\overline{\tau}_2 - \tau_2], \quad \hat{s}_1 = \mathbb{E}\left[\overline{\zeta}_1 - \zeta_1\right], \quad \hat{s}_2 = \mathbb{E}\left[\overline{\zeta}_2 - \zeta_2\right].$$

Análogamente los tiempos de traslado del servidor desde el momento en que termina de atender a una cola y llega a la siguiente para comenzar a dar servicio están dados por $\tau_2 - \overline{\tau}_1, \tau_1 - \overline{\tau}_2$ y $\zeta_2 - \overline{\zeta}_1, \zeta_1 - \overline{\zeta}_2$ para el sistema 1 y el sistema 2, respectivamente.

La FGP para estos tiempos de traslado están dados por

$$\begin{aligned} R_1(z_1) &= \mathbb{E}\left[z_1^{\tau_2 - \overline{\tau}_1}\right], & R_2(z_2) &= \mathbb{E}\left[z_2^{\tau_1 - \overline{\tau}_2}\right], \\ \hat{R}_1(w_1) &= \mathbb{E}\left[w_1^{\zeta_2 - \overline{\zeta}_1}\right], & \hat{R}_2(w_2) &= \mathbb{E}\left[w_2^{\zeta_1 - \overline{\zeta}_2}\right], \end{aligned}$$

y al igual que como se hizo con anterioridad

$$r_1 = R_1^{(1)}(1) = \mathbb{E}\left[\tau_2 - \overline{\tau}_1\right], \quad r_2 = R_2^{(1)}(1) = \mathbb{E}\left[\tau_1 - \overline{\tau}_2\right],$$
$$\hat{r}_1 = \hat{R}_1^{(1)}(1) = \mathbb{E}\left[\zeta_2 - \overline{\zeta}_1\right], \quad \hat{r}_2 = \hat{R}_2^{(1)}(1) = \mathbb{E}\left[\zeta_1 - \overline{\zeta}_2\right].$$

Se definen los procesos de conteo para el número de usuarios en cada una de las colas al tiempo t, $L_1(t), L_2(t)$, para $H_1(t), H_2(t)$ del sistema 1, respectivamente. Y para el segundo sistema, se tienen los procesos $\hat{L}_1(t), \hat{L}_2(t)$ para $\hat{H}_1(t), \hat{H}_2(t)$, respectivamente, es decir,

$$H_1(t) = \mathbb{E}\left[z_1^{L_1(t)}\right], \quad H_2(t) = \mathbb{E}\left[z_2^{L_2(t)}\right], \quad \hat{H}_1(t) = \mathbb{E}\left[w_1^{\hat{L}_1(t)}\right], \quad \hat{H}_2(t) = \mathbb{E}\left[w_2^{\hat{L}_2(t)}\right].$$

Por lo dicho anteriormente se tiene que el número de usuarios presentes en los tiempos $\overline{\tau}_1, \overline{\tau}_2, \overline{\zeta}_1, \overline{\zeta}_2$, es cero, es decir, $L_i(\overline{\tau_i}) = 0$, y $\hat{L}_i\left(\overline{\zeta_i}\right) = 0$ para i=1,2 para cada uno de los dos sistemas.

Para cada una de las colas en cada sistema, el número de usuarios al tiempo en que llega el servidor a dar servicio está dado por el número de usuarios presentes en la cola al tiempo $t = \tau_i, \zeta_i$, más el número de usuarios que llegan a la cola en el intervalo de tiempo $[\tau_i, \overline{\tau}_i], \left[\zeta_i, \overline{\zeta}_i\right]$, es decir

$$L_1(\overline{\tau}_1) = L_1(\tau_1) + X_1(\overline{\tau}_1 - \tau_1), \quad \hat{L}_1(\overline{\tau}_1) = \hat{L}_1(\tau_1) + \hat{X}_1(\overline{\tau}_1 - \tau_1),$$
$$\hat{L}_2(\overline{\tau}_1) = \hat{L}_2(\tau_1) + \hat{X}_2(\overline{\tau}_1 - \tau_1).$$

En el caso específico de Q_2, además, hay que considerar el número de usuarios que pasan del sistema 2 al sistema 1, a traves de $\hat{Q}_2$ mientras el servidor en Q_2 está ausente, es decir:

$$L_2(\overline{\tau}_1) = L_2(\tau_1) + X_2(\overline{\tau}_1 - \tau_1) + Y_2(\overline{\tau}_1 - \tau_1). \tag{36.56.1}$$

36.56.2. El problema de la ruina del jugador

Supongamos que se tiene un jugador que cuenta con un capital inicial de $\tilde{L}_0 \geq 0$ unidades, esta persona realiza una serie de dos juegos simultáneos e independientes de manera sucesiva, dichos eventos son independientes e idénticos entre sí para cada realización.

La ganancia en el n-ésimo juego es

$$\tilde{X}_n = X_n + Y_n$$

unidades de las cuales se resta una cuota de 1 unidad por cada juego simultáneo, es decir, se restan dos unidades por cada juego realizado.

En términos de la teoría de colas puede pensarse como el número de usuarios que llegan a una cola vía dos procesos de arribo distintos e independientes entre sí.

Su Función Generadora de Probabilidades (FGP) está dada por

$$F(z) = \mathbb{E}\left[z^{\tilde{L}_0}\right]$$

$$\tilde{P}(z) = \mathbb{E}\left[z^{\tilde{X}_n}\right] = \mathbb{E}\left[z^{X_n + Y_n}\right] = \mathbb{E}\left[z^{X_n} z^{Y_n}\right] = \mathbb{E}\left[z^{X_n}\right]\mathbb{E}\left[z^{Y_n}\right] = P(z)\,\check{P}(z),$$

entonces

$$\tilde{\mu} \quad = \quad \mathbb{E}\left[\tilde{X}_n\right] = \tilde{P}[z] < 1.$$

Sea $\tilde{L}_n$ el capital remanente después del n-ésimo juego. Entonces

$$\tilde{L}_n \quad = \quad \tilde{L}_0 + \tilde{X}_1 + \tilde{X}_2 + \cdots + \tilde{X}_n - 2n.$$

La ruina del jugador ocurre después del n-ésimo juego, es decir, la cola se vacía después del n-ésimo juego, entonces sea T definida como

$$T \quad = \quad min\left\{\tilde{L}_n = 0\right\}$$

Si $\tilde{L}_0 = 0$, entonces claramente $T = 0$. En este sentido T puede interpretarse como la longitud del periodo de tiempo que el servidor ocupa para dar servicio en la cola, comenzando con $\tilde{L}_0$ grupos de usuarios presentes en la cola, quienes arribaron conforme a un proceso dado por $\tilde{P}(z)$.

Sea $g_{n,k}$ la probabilidad del evento de que el jugador no caiga en ruina antes del n-ésimo juego, y que además tenga un capital de k unidades antes del n-ésimo juego, es decir,

Dada $n \in \{1, 2, \ldots, \}$ y $k \in \{0, 1, 2, \ldots, \}$

$$g_{n,k} := P\left\{\tilde{L}_j > 0, j = 1, \ldots, n, \tilde{L}_n = k\right\}$$

la cual además se puede escribir como:

$$\begin{aligned}
g_{n,k} &= P\left\{\tilde{L}_j > 0, j = 1, \ldots, n, \tilde{L}_n = k\right\} = \sum_{j=1}^{k+1} g_{n-1,j} P\left\{\tilde{X}_n = k - j + 1\right\} \\
&= \sum_{j=1}^{k+1} g_{n-1,j} P\left\{X_n + Y_n = k - j + 1\right\} = \sum_{j=1}^{k+1} \sum_{l=1}^{j} g_{n-1,j} P\left\{X_n + Y_n = k - j + 1, Y_n = l\right\} \\
&= \sum_{j=1}^{k+1} \sum_{l=1}^{j} g_{n-1,j} P\left\{X_n + Y_n = k - j + 1 | Y_n = l\right\} P\left\{Y_n = l\right\} \\
&= \sum_{j=1}^{k+1} \sum_{l=1}^{j} g_{n-1,j} P\left\{X_n = k - j - l + 1\right\} P\left\{Y_n = l\right\}
\end{aligned}$$

es decir

$$g_{n,k} = \sum_{j=1}^{k+1} \sum_{l=1}^{j} g_{n-1,j} P\left\{X_n = k - j - l + 1\right\} P\left\{Y_n = l\right\} \tag{36.56.2}$$

además

$$g_{0,k} = P\left\{\tilde{L}_0 = k\right\}. \tag{36.56.3}$$

Se definen las siguientes FGP:

$$G_n(z) = \sum_{k=0}^{\infty} g_{n,k} z^k, \text{ para } n = 0, 1, \ldots, \tag{36.56.4}$$

$$G(z, w) = \sum_{n=0}^{\infty} G_n(z) w^n. \tag{36.56.5}$$

En particular para $k = 0$,

$$g_{n,0} = G_n(0) = P\left\{\tilde{L}_j > 0, \text{ para } j < n, \text{ y } \tilde{L}_n = 0\right\} = P\left\{T = n\right\},$$

además

$$G(0, w) = \sum_{n=0}^{\infty} G_n(0) w^n = \sum_{n=0}^{\infty} P\left\{T = n\right\} w^n = \mathbb{E}\left[w^T\right]$$

la cuál resulta ser la FGP del tiempo de ruina T.

Proposición 36.56.1 *Sean $G_n(z)$ y $G(z, w)$ definidas como en (36.81.4) y (36.81.5) respectivamente, entonces*

$$G_n(z) = \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right] \tilde{P}(z). \tag{36.56.6}$$

Además

$$G(z, w) = \frac{zF(z) - wP(z) G(0, w)}{z - wR(z)}, \tag{36.56.7}$$

con un único polo en el círculo unitario, además, el polo es de la forma $z = \theta(w)$ y satisface que

i) $\tilde{\theta}(1) = 1$,

ii) $\tilde{\theta}^{(1)}(1) = \frac{1}{1-\tilde{\mu}}$,

iii) $\tilde{\theta}^{(2)}(1) = \frac{\tilde{\mu}}{(1-\tilde{\mu})^2} + \frac{\tilde{\sigma}}{(1-\tilde{\mu})^3}$.

Finalmente, además se cumple que

$$\mathbb{E}\left[w^T\right] = G(0,w) = F\left[\tilde{\theta}(w)\right]. \tag{36.56.8}$$

Multiplicando las ecuaciones (36.81.2) y (36.81.3) por el término z^k:

$$\begin{aligned} g_{n,k}z^k &= \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}P\{X_n = k-j-l+1\}P\{Y_n = l\}z^k, \\ g_{0,k}z^k &= P\left\{\tilde{L}_0 = k\right\}z^k, \end{aligned}$$

ahora sumamos sobre k

$$\begin{aligned} \sum_{k=0}^{\infty} g_{n,k}z^k &= \sum_{k=0}^{\infty}\sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}P\{X_n = k-j-l+1\}P\{Y_n = l\}z^k \\ &= \sum_{k=0}^{\infty} z^k \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}P\{X_n = k-(j+l-1)\}P\{Y_n = l\} \\ &= \sum_{k=0}^{\infty} z^{k+(j+l-1)-(j+l-1)} \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}P\{X_n = k-(j+l-1)\}P\{Y_n = l\} \\ &= \sum_{k=0}^{\infty}\sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}z^{j-1}P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}P\{Y_n = l\}z^l \\ &= \sum_{j=1}^{\infty}\sum_{l=1}^{j} g_{n-1,j}z^{j-1}\sum_{k=j+l-1}^{\infty} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}P\{Y_n = l\}z^l \\ &= \sum_{j=1}^{\infty} g_{n-1,j}z^{j-1}\sum_{l=1}^{j}\sum_{k=j+l-1}^{\infty} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}P\{Y_n = l\}z^l \\ &= \sum_{j=1}^{\infty} g_{n-1,j}z^{j-1}\sum_{k=j+l-1}^{\infty}\sum_{l=1}^{j} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}P\{Y_n = l\}z^l \end{aligned}$$

luego

$$\begin{aligned} &= \sum_{j=1}^{\infty} g_{n-1,j}z^{j-1}\sum_{k=j+l-1}^{\infty}\sum_{l=1}^{j} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}\sum_{l=1}^{j} P\{Y_n = l\}z^l \\ &= \sum_{j=1}^{\infty} g_{n-1,j}z^{j-1}\sum_{l=1}^{\infty} P\{Y_n = l\}z^l \sum_{k=j+l-1}^{\infty}\sum_{l=1}^{j} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)} \\ &= \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z)\sum_{k=j+l-1}^{\infty}\sum_{l=1}^{j} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)} \\ &= \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z)P(z) = \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z), \end{aligned}$$

es decir la ecuación (36.81.4) se puede reescribir como

$$G_n(z) = \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z). \tag{36.56.9}$$

Por otra parte recordemos la ecuación (36.81.4)

$$G_n(z) = \sum_{k=0}^{\infty} g_{n,k}z^k, \text{ entonces } \frac{G_n(z)}{z} = \sum_{k=1}^{\infty} g_{n,k}z^{k-1},$$

Por lo tanto utilizando la ecuación (36.81.9):

$$\begin{aligned} G(z,w) &= \sum_{n=0}^{\infty} G_n(z)\, w^n = G_0(z) + \sum_{n=1}^{\infty} G_n(z)\, w^n = F(z) + \sum_{n=0}^{\infty} \left[G_n(z) - G_n(0)\right] w^n \frac{\tilde{P}(z)}{z} \\ &= F(z) + \frac{w}{z} \sum_{n=0}^{\infty} \left[G_n(z) - G_n(0)\right] w^{n-1} \tilde{P}(z) \end{aligned}$$

es decir

$$G(z,w) = F(z) + \frac{w}{z}\left[G(z,w) - G(0,w)\right]\tilde{P}(z),$$

entonces

$$\begin{aligned} G(z,w) = F(z) + \frac{w}{z}\left[G(z,w) - G(0,w)\right]\tilde{P}(z) &= F(z) + \frac{w}{z}\tilde{P}(z)\, G(z,w) - \frac{w}{z}\tilde{P}(z)\, G(0,w) \\ &\Leftrightarrow \\ G(z,w)\left\{1 - \frac{w}{z}\tilde{P}(z)\right\} &= F(z) - \frac{w}{z}\tilde{P}(z)\, G(0,w), \end{aligned}$$

por lo tanto,

$$G(z,w) = \frac{zF(z) - w\tilde{P}(z)\, G(0,w)}{1 - w\tilde{P}(z)}. \tag{36.56.10}$$

Ahora $G(z,w)$ es analítica en $|z| = 1$. Sean z, w tales que $|z| = 1$ y $|w| \leq 1$, como $\tilde{P}(z)$ es FGP

$$|z - \left(z - w\tilde{P}(z)\right)| < |z| \Leftrightarrow |w\tilde{P}(z)| < |z|$$

es decir, se cumplen las condiciones del Teorema de Rouché y por tanto, z y $z - w\tilde{P}(z)$ tienen el mismo número de ceros en $|z| = 1$. Sea $z = \tilde{\theta}(w)$ la solución única de $z - w\tilde{P}(z)$, es decir

$$\tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right) = 0, \tag{36.56.11}$$

con $|\tilde{\theta}(w)| < 1$. Cabe hacer mención que $\tilde{\theta}(w)$ es la FGP para el tiempo de ruina cuando $\tilde{L}_0 = 1$.
Considerando la ecuación (36.81.11)

$$\begin{aligned} &\frac{\partial}{\partial w}\tilde{\theta}(w)|_{w=1} - \frac{\partial}{\partial w}\left\{w\tilde{P}\left(\tilde{\theta}(w)\right)\right\}|_{w=1} = 0 \\ &\tilde{\theta}^{(1)}(w)|_{w=1} - \frac{\partial}{\partial w} w\left\{\tilde{P}\left(\tilde{\theta}(w)\right)\right\}|_{w=1} - w\frac{\partial}{\partial w}\tilde{P}\left(\tilde{\theta}(w)\right)|_{w=1} = 0 \\ &\tilde{\theta}^{(1)}(1) - \tilde{P}\left(\tilde{\theta}(1)\right) - w\left\{\frac{\partial\tilde{P}\left(\tilde{\theta}(w)\right)}{\partial\tilde{\theta}(w)} \cdot \frac{\partial\tilde{\theta}(w)}{\partial w}|_{w=1}\right\} = 0 \\ &\tilde{\theta}^{(1)}(1) - \tilde{P}\left(\tilde{\theta}(1)\right) - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right) \cdot \tilde{\theta}^{(1)}(1) = 0 \end{aligned}$$

luego

$$\begin{aligned} &\tilde{\theta}^{(1)}(1) - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right) \cdot \tilde{\theta}^{(1)}(1) = \tilde{P}\left(\tilde{\theta}(1)\right) \\ &\tilde{\theta}^{(1)}(1)\left(1 - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)\right) = \tilde{P}\left(\tilde{\theta}(1)\right) \\ &\tilde{\theta}^{(1)}(1) = \frac{\tilde{P}\left(\tilde{\theta}(1)\right)}{\left(1 - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)\right)} = \frac{1}{1 - \tilde{\mu}}. \end{aligned}$$

Ahora determinemos el segundo momento de $\tilde{\theta}(w)$, nuevamente consideremos la ecuación (36.81.11):

$$\begin{aligned} &\tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right) = 0 \\ &\frac{\partial}{\partial w}\left\{\tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right)\right\} = 0 \\ &\frac{\partial}{\partial w}\left\{\frac{\partial}{\partial w}\left\{\tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right)\right\}\right\} = 0 \end{aligned}$$

luego

$$\begin{aligned}
\frac{\partial}{\partial w}\left\{\frac{\partial}{\partial w}\tilde{\theta}(w)-\frac{\partial}{\partial w}\left[w\tilde{P}\left(\tilde{\theta}(w)\right)\right]\right\} &= \frac{\partial}{\partial w}\left\{\frac{\partial}{\partial w}\tilde{\theta}(w)-\frac{\partial}{\partial w}\left[w\tilde{P}\left(\tilde{\theta}(w)\right)\right]\right\} \\
&= \frac{\partial}{\partial w}\left\{\frac{\partial\tilde{\theta}(w)}{\partial w}-\left[\tilde{P}\left(\tilde{\theta}(w)\right)+w\frac{\partial}{\partial w}R\left(\tilde{\theta}(w)\right)\right]\right\} \\
&= \frac{\partial}{\partial w}\left\{\frac{\partial\tilde{\theta}(w)}{\partial w}-\left[\tilde{P}\left(\tilde{\theta}(w)\right)+w\frac{\partial\tilde{P}\left(\tilde{\theta}(w)\right)}{\partial w}\frac{\partial\tilde{\theta}(w)}{\partial w}\right]\right\} \\
&= \frac{\partial}{\partial w}\left\{\tilde{\theta}^{(1)}(w)-\tilde{P}\left(\tilde{\theta}(w)\right)-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)\right\} \\
&= \frac{\partial}{\partial w}\tilde{\theta}^{(1)}(w)-\frac{\partial}{\partial w}\tilde{P}\left(\tilde{\theta}(w)\right)-\frac{\partial}{\partial w}\left[w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)\right]
\end{aligned}$$

$$\begin{aligned}
&= \frac{\partial}{\partial w}\tilde{\theta}^{(1)}(w)-\frac{\partial\tilde{P}\left(\tilde{\theta}(w)\right)}{\partial\tilde{\theta}(w)}\frac{\partial\tilde{\theta}(w)}{\partial w}-\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w) \\
&- w\frac{\partial\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}{\partial w}\tilde{\theta}^{(1)}(w)-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\frac{\partial\tilde{\theta}^{(1)}(w)}{\partial w} \\
&= \tilde{\theta}^{(2)}(w)-\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)-\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w) \\
&- w\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)\left(\tilde{\theta}^{(1)}(w)\right)^2-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(2)}(w) \\
&= \tilde{\theta}^{(2)}(w)-2\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w) \\
&- w\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)\left(\tilde{\theta}^{(1)}(w)\right)^2-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(2)}(w) \\
&= \tilde{\theta}^{(2)}(w)\left[1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right]-\tilde{\theta}^{(1)}(w)\left[w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)+2\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right]
\end{aligned}$$

luego

$$\begin{aligned}
\tilde{\theta}^{(2)}(w)\left[1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right] &- \tilde{\theta}^{(1)}(w)\left[w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)+2\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right]=0 \\
\tilde{\theta}^{(2)}(w) &= \frac{\tilde{\theta}^{(1)}(w)\left[w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)+2R^{(1)}\left(\tilde{\theta}(w)\right)\right]}{1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)} \\
\tilde{\theta}^{(2)}(w) &= \frac{\tilde{\theta}^{(1)}(w)\,w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)}{1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}+\frac{2\tilde{\theta}^{(1)}(w)\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}{1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}
\end{aligned}$$

si evaluamos la expresión anterior en $w=1$:

$$\begin{aligned}
\tilde{\theta}^{(2)}(1) &= \frac{\left(\tilde{\theta}^{(1)}(1)\right)^2\tilde{P}^{(2)}\left(\tilde{\theta}(1)\right)}{1-\tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)}+\frac{2\tilde{\theta}^{(1)}(1)\tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)}{1-\tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)}=\frac{\left(\tilde{\theta}^{(1)}(1)\right)^2\tilde{P}^{(2)}(1)}{1-\tilde{P}^{(1)}(1)}+\frac{2\tilde{\theta}^{(1)}(1)\tilde{P}^{(1)}(1)}{1-\tilde{P}^{(1)}(1)} \\
&= \frac{\left(\frac{1}{1-\tilde{\mu}}\right)^2\tilde{P}^{(2)}(1)}{1-\tilde{\mu}}+\frac{2\left(\frac{1}{1-\tilde{\mu}}\right)\tilde{\mu}}{1-\tilde{\mu}}=\frac{\tilde{P}^{(2)}(1)}{(1-\tilde{\mu})^3}+\frac{2\tilde{\mu}}{(1-\tilde{\mu})^2}=\frac{\sigma^2-\tilde{\mu}+\tilde{\mu}^2}{(1-\tilde{\mu})^3}+\frac{2\tilde{\mu}}{(1-\tilde{\mu})^2} \\
&= \frac{\sigma^2-\tilde{\mu}+\tilde{\mu}^2+2\tilde{\mu}(1-\tilde{\mu})}{(1-\tilde{\mu})^3}
\end{aligned}$$

es decir

$$\tilde{\theta}^{(2)}(1) = \frac{\sigma^2+\tilde{\mu}-\tilde{\mu}^2}{(1-\tilde{\mu})^3}=\frac{\sigma^2}{(1-\tilde{\mu})^3}+\frac{\tilde{\mu}(1-\tilde{\mu})}{(1-\tilde{\mu})^3}=\frac{\sigma^2}{(1-\tilde{\mu})^3}+\frac{\tilde{\mu}}{(1-\tilde{\mu})^2}.$$

Corolario 36.56.1 *El tiempo de ruina del jugador tiene primer y segundo momento dados por*

$$\mathbb{E}[T] = \frac{\mathbb{E}\left[\tilde{L}_0\right]}{1-\tilde{\mu}} \tag{36.56.12}$$

$$Var[T] = \frac{Var\left[\tilde{L}_0\right]}{(1-\tilde{\mu})^2}+\frac{\sigma^2\mathbb{E}\left[\tilde{L}_0\right]}{(1-\tilde{\mu})^3}. \tag{36.56.13}$$

36.57. Procesos de Llegadas a las colas en la RSVC

Se definen los procesos de llegada de los usuarios a cada una de las colas dependiendo de la llegada del servidor pero del sistema al cuál no pertenece la cola en cuestión:

Para el sistema 1 y el servidor del segundo sistema

$$F_{i,j}\left(z_i;\zeta_j\right)=\mathbb{E}\left[z_i^{L_i(\zeta_j)}\right]=\sum_{k=0}^{\infty}\mathbb{P}\left[L_i\left(\zeta_j\right)=k\right]z_i^k,\text{ para } i,j=1,2.$$

Ahora se definen para el segundo sistema y el servidor del primero

$$\hat{F}_{i,j}\left(w_i;\tau_j\right) = \mathbb{E}\left[w_i^{\hat{L}_i(\tau_j)}\right]=\sum_{k=0}^{\infty}\mathbb{P}\left[\hat{L}_i\left(\tau_j\right)=k\right]w_i^k,\text{ para } i,j=1,2.$$

Ahora, con lo anterior definamos la FGP conjunta para el segundo sistema;

$$\mathbb{E}\left[w_1^{\hat{L}_1(\tau_j)}w_2^{\hat{L}_2(\tau_j)}\right] = \mathbb{E}\left[w_1^{\hat{L}_1(\tau_j)}\right]\mathbb{E}\left[w_2^{\hat{L}_2(\tau_j)}\right]=\hat{F}_{1,j}\left(w_1;\tau_j\right)\hat{F}_{2,j}\left(w_2;\tau_j\right)=\hat{F}_j\left(w_1,w_2;\tau_j\right).$$

Con respecto al sistema 1 se tiene la FGP conjunta con respecto al servidor del otro sistema:

$$\mathbb{E}\left[z_1^{L_1(\zeta_j)}z_2^{L_2(\zeta_j)}\right] = \mathbb{E}\left[z_1^{L_1(\zeta_j)}\right]\mathbb{E}\left[z_2^{L_2(\zeta_j)}\right]=F_{1,j}\left(z_1;\zeta_j\right)F_{2,j}\left(z_2;\zeta_j\right)=F_j\left(z_1,z_2;\zeta_j\right).$$

Ahora analicemos la Red de Sistemas de Visitas Cíclicas, entonces se define la PGF conjunta al tiempo t para los tiempos de visita del servidor en cada una de las colas, para comenzar a dar servicio, definidos anteriormente al tiempo $t=\{\tau_1,\tau_2,\zeta_1,\zeta_2\}$:

$$F_j\left(z_1,z_2,w_1,w_2\right) = \mathbb{E}\left[\prod_{i=1}^{2}z_i^{L_i(\tau_j)}\prod_{i=1}^{2}w_i^{\hat{L}_i(\tau_j)}\right] \tag{36.57.1}$$

$$\hat{F}_j\left(z_1,z_2,w_1,w_2\right) = \mathbb{E}\left[\prod_{i=1}^{2}z_i^{L_i(\zeta_j)}\prod_{i=1}^{2}w_i^{\hat{L}_i(\zeta_j)}\right] \tag{36.57.2}$$

para $j=1,2$. Entonces, con la finalidad de encontrar el número de usuarios presentes en el sistema cuando el servidor deja de atender una de las colas de cualquier sistema se tiene lo siguiente

$$\begin{aligned}&\mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)}z_2^{L_2(\overline{\tau}_1)}w_1^{\hat{L}_1(\overline{\tau}_1)}w_2^{\hat{L}_2(\overline{\tau}_1)}\right]=\mathbb{E}\left[z_2^{L_2(\overline{\tau}_1)}w_1^{\hat{L}_1(\overline{\tau}_1)}w_2^{\hat{L}_2(\overline{\tau}_1)}\right]\\ =\ &\mathbb{E}\left[z_2^{L_2(\tau_1)+X_2(\overline{\tau}_1-\tau_1)+Y_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{L}_1(\tau_1)+\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{L}_2(\tau_1)+\hat{X}_2(\overline{\tau}_1-\tau_1)}\right]\end{aligned}$$

utilizando la ecuacion dada (36.82.1), luego

$$\begin{aligned}=\ &\mathbb{E}\left[z_2^{L_2(\tau_1)}z_2^{X_2(\overline{\tau}_1-\tau_1)}z_2^{Y_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{L}_1(\tau_1)}w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{L}_2(\tau_1)}w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right]\\ =\ &\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right\}\left\{z_2^{X_2(\overline{\tau}_1-\tau_1)}z_2^{Y_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right]\end{aligned}$$

Aplicando la ecuación (36.81.1)

$$=\ \mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{z_2^{X_2(\overline{\tau}_1-\tau_1)}z_2^{Y_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]$$

dado que los arribos a cada una de las colas son independientes, podemos separar la esperanza para los procesos de llegada a Q_1 y Q_2 en τ_1

Recordando que $\tilde{X}_2\left(z_2\right)=X_2\left(z_2\right)+Y_2\left(z_2\right)$ se tiene

$$\begin{aligned}=\ &\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{z_2^{\tilde{X}_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]\\ =\ &\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{\tilde{P}_2\left(z_2\right)^{\overline{\tau}_1-\tau_1}\hat{P}_1\left(w_1\right)^{\overline{\tau}_1-\tau_1}\hat{P}_2\left(w_2\right)^{\overline{\tau}_1-\tau_1}\right\}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]\\ =\ &\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right\}^{\overline{\tau}_1-\tau_1}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]\end{aligned}$$

Entonces

$$
\begin{aligned}
&= \mathbb{E}\left[z_2^{L_2(\tau_1)}\theta_1\left(\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right)^{L_1(\tau_1)}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]\\
&= F_1\left(\theta_1\left(\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),z2\right)\hat{F}_1\left(w_1,w_2;\tau_1\right)\\
&\equiv F_1\left(\theta_1\left(\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),z_2,w_1,w_2\right)
\end{aligned}
$$

Las igualdades anteriores son ciertas pues el número de usuarios que llegan a $\hat{Q}_2$ durante el intervalo $[\tau_1,\overline{\tau}_1]$ aún no han sido atendidos por el servidor del sistema 2 y por tanto aún no pueden pasar al sistema 1 por Q_2. Por tanto el número de usuarios que pasan de $\hat{Q}_2$ a Q_2 en el intervalo de tiempo $[\tau_1,\overline{\tau}_1]$ depende de la política de traslado entre los dos sistemas, conforme a la sección anterior.

Por lo tanto

$$
\begin{aligned}
\mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)}z_2^{L_2(\overline{\tau}_1)}w_1^{\hat{L}_1(\overline{\tau}_1)}w_2^{\hat{L}_2(\overline{\tau}_1)}\right] &= F_1\left(\theta_1\left(\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),z_2,w_1,w_2\right) && (36.57.3)\\
&= F_1\left(\theta_1\left(\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),z2\right)\hat{F}_1\left(w_1,w_2;\tau_1\right) && (36.57.4)
\end{aligned}
$$

Utilizando un razonamiento análogo para $\overline{\tau}_2$:

$$
\begin{aligned}
&\mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)}z_2^{L_2(\overline{\tau}_2)}w_1^{\hat{L}_1(\overline{\tau}_2)}w_2^{\hat{L}_2(\overline{\tau}_2)}\right]=\mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)}w_1^{\hat{L}_1(\overline{\tau}_2)}w_2^{\hat{L}_2(\overline{\tau}_2)}\right]\\
=\ &\mathbb{E}\left[z_1^{L_1(\tau_2)+X_1(\overline{\tau}_2-\tau_2)}w_1^{\hat{L}_1(\tau_2)+\hat{X}_1(\overline{\tau}_2-\tau_2)}w_2^{\hat{L}_2(\tau_2)+\hat{X}_2(\overline{\tau}_2-\tau_2)}\right]\\
=\ &\mathbb{E}\left[z_1^{L_1(\tau_2)}z_1^{X_1(\overline{\tau}_2-\tau_2)}w_1^{\hat{L}_1(\tau_2)}w_1^{\hat{X}_1(\overline{\tau}_2-\tau_2)}w_2^{\hat{L}_2(\tau_2)}w_2^{\hat{X}_2(\overline{\tau}_2-\tau_2)}\right]\\
=\ &\mathbb{E}\left[z_1^{L_1(\tau_2)}z_1^{X_1(\overline{\tau}_2-\tau_2)}w_1^{\hat{X}_1(\overline{\tau}_2-\tau_2)}w_2^{\hat{X}_2(\overline{\tau}_2-\tau_2)}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)}w_2^{\hat{L}_2(\tau_2)}\right]\\
=\ &\mathbb{E}\left[z_1^{L_1(\tau_2)}P_1\left(z_1\right)^{\overline{\tau}_2-\tau_2}\hat{P}_1\left(w_1\right)^{\overline{\tau}_2-\tau_2}\hat{P}_2\left(w_2\right)^{\overline{\tau}_2-\tau_2}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)}w_2^{\hat{L}_2(\tau_2)}\right]
\end{aligned}
$$

utlizando la proposición relacionada con la ruina del jugador

$$
\begin{aligned}
&= \mathbb{E}\left[z_1^{L_1(\tau_2)}\left\{P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right\}^{\overline{\tau}_2-\tau_2}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)}w_2^{\hat{L}_2(\tau_2)}\right]\\
&= \mathbb{E}\left[z_1^{L_1(\tau_2)}\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right)^{L_2(\tau_2)}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)}w_2^{\hat{L}_2(\tau_2)}\right]\\
&= F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right)\right)\hat{F}_2\left(w_1,w_2;\tau_2\right)
\end{aligned}
$$

entonces se define

$$
\begin{aligned}
\mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)}z_2^{L_2(\overline{\tau}_2)}w_1^{\hat{L}_1(\overline{\tau}_2)}w_2^{\hat{L}_2(\overline{\tau}_2)}\right] &= F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right) && (36.57.5)\\
&\equiv F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right)\right)\hat{F}_2\left(w_1,w_2;\tau_2\right) && (36.57.6)
\end{aligned}
$$

Ahora para $\overline{\zeta}_1$:

$$
\begin{aligned}
&\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)}z_2^{L_2(\overline{\zeta}_1)}w_1^{\hat{L}_1(\overline{\zeta}_1)}w_2^{\hat{L}_2(\overline{\zeta}_1)}\right]=\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)}z_2^{L_2(\overline{\zeta}_1)}w_2^{\hat{L}_2(\overline{\zeta}_1)}\right]\\
=\ &\mathbb{E}\left[z_1^{L_1(\zeta_1)}z_1^{X_1(\overline{\zeta}_1-\zeta_1)}z_2^{L_2(\zeta_1)}z_2^{X_2(\overline{\zeta}_1-\zeta_1)}z_2^{Y_2(\overline{\zeta}_1-\zeta_1)}w_2^{\hat{L}_2(\zeta_1)}w_2^{\hat{X}_2(\overline{\zeta}_1-\zeta_1)}\right]\\
=\ &\mathbb{E}\left[z_1^{L_1(\zeta_1)}z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[z_1^{X_1(\overline{\zeta}_1-\zeta_1)}z_2^{\hat{X}_2(\overline{\zeta}_1-\zeta_1)}w_2^{\hat{X}_2(\overline{\zeta}_1-\zeta_1)}w_2^{\hat{L}_2(\zeta_1)}\right]\\
=\ &\mathbb{E}\left[z_1^{L_1(\zeta_1)}z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[P_1\left(z_1\right)^{\overline{\zeta}_1-\zeta_1}\tilde{P}_2\left(z_2\right)^{\overline{\zeta}_1-\zeta_1}\hat{P}_2\left(w_2\right)^{\overline{\zeta}_1-\zeta_1}w_2^{\hat{L}_2(\zeta_1)}\right]\\
=\ &\mathbb{E}\left[z_1^{L_1(\zeta_1)}z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[\left\{P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right\}^{\overline{\zeta}_1-\zeta_1}w_2^{\hat{L}_2(\zeta_1)}\right]\\
=\ &\mathbb{E}\left[z_1^{L_1(\zeta_1)}z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right)^{\hat{L}_1(\zeta_1)}w_2^{\hat{L}_2(\zeta_1)}\right]\\
=\ &F_1\left(z_1,z_2;\zeta_1\right)\hat{F}_1\left(\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)
\end{aligned}
$$

es decir

$$
\begin{aligned}
\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)}z_2^{L_2(\overline{\zeta}_1)}w_1^{\hat{L}_1(\overline{\zeta}_1)}w_2^{\hat{L}_2(\overline{\zeta}_1)}\right] &= \hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right) && (36.57.7)\\
&= F_1\left(z_1,z_2;\zeta_1\right)\hat{F}_1\left(\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right). && (36.57.8)
\end{aligned}
$$

Finalmente para $\overline{\zeta}_2$:

$$\begin{aligned}
& \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)} w_2^{\hat{L}_2(\overline{\zeta}_2)}\right] = \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)}\right] \\
= & \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_1^{X_1(\overline{\zeta}_2-\zeta_2)} z_2^{L_2(\zeta_2)} z_2^{X_2(\overline{\zeta}_2-\zeta_2)} z_2^{Y_2(\overline{\zeta}_2-\zeta_2)} w_1^{\hat{L}_1(\zeta_2)} w_1^{\hat{X}_1(\overline{\zeta}_2-\zeta_2)}\right] \\
= & \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_2^{L_2(\zeta_2)}\right] \mathbb{E}\left[z_1^{X_1(\overline{\zeta}_2-\zeta_2)} z_2^{\tilde{X}_2(\overline{\zeta}_2-\zeta_2)} w_1^{\hat{X}_1(\overline{\zeta}_2-\zeta_2)} w_1^{\hat{L}_1(\zeta_2)}\right] \\
= & \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_2^{L_2(\zeta_2)}\right] \mathbb{E}\left[P_1(z_1)^{\overline{\zeta}_2-\zeta_2}\, \tilde{P}_2(z_2)^{\overline{\zeta}_2-\zeta_2}\, \hat{P}(w_1)^{\overline{\zeta}_2-\zeta_2}\, w_1^{\hat{L}_1(\zeta_2)}\right] \\
= & \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_2^{L_2(\zeta_2)}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\zeta_2)} \left\{P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}(w_1)\right\}^{\overline{\zeta}_2-\zeta_2}\right] \\
= & \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_2^{L_2(\zeta_2)}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\zeta_2)} \hat{\theta}_2\left(P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}(w_1)\right)^{\hat{L}_2\zeta_2}\right] \\
= & F_2(z_1, z_2; \zeta_2)\, \hat{F}_2\left(w_1, \hat{\theta}_2\left(P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}_1(w_1)\right)\right]
\end{aligned}$$

es decir

$$\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)} w_2^{\hat{L}_2(\overline{\zeta}_2)}\right] = \hat{F}_2\left(z_1, z_2, w_1, \hat{\theta}_2\left(P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}_1(w_1)\right)\right) \tag{36.57.9}$$

$$= F_2(z_1, z_2; \zeta_2)\, \hat{F}_2\left(w_1, \hat{\theta}_2\left(P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}_1(w_1)\right)\right) \tag{36.57.10}$$

36.58. Ecuaciones Recursivas para la R.S.V.C.

Con lo desarrollado hasta ahora podemos encontrar las ecuaciones recursivas que modelan la Red de Sistemas de Visitas Cíclicas (R.S.V.C):

$$\begin{aligned}
F_2(z_1, z_2, w_1, w_2) &= R_1(z_1, z_2, w_1, w_2)\, \mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)} z_2^{L_2(\overline{\tau}_1)} w_1^{\hat{L}_1(\overline{\tau}_1)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right] \\
F_1(z_1, z_2, w_1, w_2) &= R_2(z_1, z_2, w_1, w_2)\, \mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)} z_2^{L_2(\overline{\tau}_2)} w_1^{\hat{L}_1(\overline{\tau}_2)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right] \\
\hat{F}_2(z_1, z_2, w_1, w_2) &= \hat{R}_1(z_1, z_2, w_1, w_2)\, \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)} z_2^{L_2(\overline{\zeta}_1)} w_1^{\hat{L}_1(\overline{\zeta}_1)} w_2^{\hat{L}_2(\overline{\zeta}_1)}\right] \\
\hat{F}_1(z_1, z_2, w_1, w_2) &= \hat{R}_2(z_1, z_2, w_1, w_2)\, \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)} w_2^{\hat{L}_2(\overline{\zeta}_2)}\right]
\end{aligned}$$

que son equivalentes a las siguientes ecuaciones

$$F_2(z_1, z_2, w_1, w_2) = R_1\left(P_1(z_1)\, \tilde{P}_2(z_2) \prod_{i=1}^{2} \hat{P}_i(w_i)\right) F_1\left(\theta_1\left(\tilde{P}_2(z_2)\, \hat{P}_1(w_1)\, \hat{P}_2(w_2)\right), z_2, w_1, w_2\right) \tag{36.58.1}$$

$$F_1(z_1, z_2, w_1, w_2) = R_2\left(P_1(z_1)\, \tilde{P}_2(z_2) \prod_{i=1}^{2} \hat{P}_i(w_i)\right) F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\, \hat{P}_1(w_1)\, \hat{P}_2(w_2)\right), w_1, w_2\right) \tag{36.58.2}$$

$$\hat{F}_2(z_1, z_2, w_1, w_2) = \hat{R}_1\left(P_1(z_1)\, \tilde{P}_2(z_2) \prod_{i=1}^{2} \hat{P}_i(w_i)\right) \hat{F}_1\left(z_1, z_2, \hat{\theta}_1\left(P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}_2(w_2)\right), w_2\right) \tag{36.58.3}$$

$$\hat{F}_1(z_1, z_2, w_1, w_2) = \hat{R}_2\left(P_1(z_1)\, \tilde{P}_2(z_2) \prod_{i=1}^{2} \hat{P}_i(w_i)\right) \hat{F}_2\left(z_1, z_2, w_1, \hat{\theta}_2\left(P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}_1(w_1)\right)\right) \tag{36.58.4}$$

36.58.1. Tiempos de Traslado del Servidor

Para

$$R_1(\mathbf{z}, \mathbf{w}) = R_1\left((P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}_1(w_1)\, \hat{P}_2(w_2)\right) \tag{36.58.5}$$

se tiene que

$$\begin{aligned}
\tfrac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= R_1^{(1)}(1)\, P_1^{(1)}(1) = r_1\mu_1, & \tfrac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= R_1^{(1)}(1)\, \tilde{P}_2^{(1)}(1) = r_1\tilde{\mu}_2, \\
\tfrac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= R_1^{(1)}(1)\, \hat{P}_1^{(1)}(1) = r_1\hat{\mu}_1, & \tfrac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= R_1^{(1)}(1)\, \hat{P}_2^{(1)}(1) = r_1\hat{\mu}_2,
\end{aligned}$$

Análogamente se tiene

$$R_2(\mathbf{z},\mathbf{w}) = R_2\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right) \tag{36.58.6}$$

$$\begin{array}{ll}\frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} = R_2^{(1)}(1)\,P_1^{(1)}(1) = r_2\mu_1, & \frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} = R_2^{(1)}(1)\,\tilde{P}_2^{(1)}(1) = r_2\tilde{\mu}_2,\\ \frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} = R_2^{(1)}(1)\,\hat{P}_1^{(1)}(1) = r_2\hat{\mu}_1, & \frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} = R_2^{(1)}(1)\,\hat{P}_2^{(1)}(1) = r_2\hat{\mu}_2,\end{array}$$

Para el segundo sistema:

$$\hat{R}_1(\mathbf{z},\mathbf{w}) = \hat{R}_1\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right) \tag{36.58.7}$$

$$\begin{array}{ll}\frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_1^{(1)}(1)\,P_1^{(1)}(1) = \hat{r}_1\mu_1, & \frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_1^{(1)}(1)\,\tilde{P}_2^{(1)}(1) = \hat{r}_1\tilde{\mu}_2,\\ \frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_1^{(1)}(1)\,\hat{P}_1^{(1)}(1) = \hat{r}_1\hat{\mu}_1, & \frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_1^{(1)}(1)\,\hat{P}_2^{(1)}(1) = \hat{r}_1\hat{\mu}_2,\end{array}$$

Finalmente

$$\hat{R}_2(\mathbf{z},\mathbf{w}) = \hat{R}_2\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right) \tag{36.58.8}$$

$$\begin{array}{ll}\frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_2^{(1)}(1)\,P_1^{(1)}(1) = \hat{r}_2\mu_1, & \frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_2^{(1)}(1)\,\tilde{P}_2^{(1)}(1) = \hat{r}_2\tilde{\mu}_2,\\ \frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_2^{(1)}(1)\,\hat{P}_1^{(1)}(1) = \hat{r}_2\hat{\mu}_1, & \frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_2^{(1)}(1)\,\hat{P}_2^{(1)}(1) = \hat{r}_2\hat{\mu}_2.\end{array}$$

36.58.2. Usuarios presentes en la cola

Hagamos lo correspondiente con las siguientes expresiones obtenidas en la sección anterior: Recordemos que

$$F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right) = F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2\right)\hat{F}_1(w_1, w_2; \tau_1)$$

entonces

$$\begin{array}{rcl}\frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} & = & 0\\ \frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} & = & \frac{\partial F_1}{\partial z_1}\cdot\frac{\partial \theta_1}{\partial \tilde{P}_2}\cdot\frac{\partial \tilde{P}_2}{\partial z_2} + \frac{\partial F_1}{\partial z_2}\\ \frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} & = & \frac{\partial F_1}{\partial z_1}\cdot\frac{\partial \theta_1}{\partial \hat{P}_1}\cdot\frac{\partial \hat{P}_1}{\partial w_1} + \frac{\partial \hat{F}_1}{\partial w_1}\\ \frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} & = & \frac{\partial F_1}{\partial z_1}\cdot\frac{\partial \theta_1}{\partial \hat{P}_2}\cdot\frac{\partial \hat{P}_2}{\partial w_2} + \frac{\partial \hat{F}_1}{\partial w_2}\end{array}$$

para τ_2:

$$F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), w_1, w_2\right) = F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right)\right)\hat{F}_2(w_1, w_2; \tau_2)$$

al igual que antes

$$
\begin{aligned}
\frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_2}{\partial z_2}\cdot\frac{\partial\tilde{\theta}_2}{\partial P_1}\cdot\frac{\partial P_1}{\partial z_2}+\frac{\partial F_2}{\partial z_1}\\
\frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= 0\\
\frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_2}{\partial z_2}\cdot\frac{\partial\tilde{\theta}_2}{\partial \hat{P}_1}\cdot\frac{\partial \hat{P}_1}{\partial w_1}+\frac{\partial \hat{F}_2}{\partial w_1}\\
\frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_2}{\partial z_2}\cdot\frac{\partial\tilde{\theta}_2}{\partial \hat{P}_2}\cdot\frac{\partial \hat{P}_2}{\partial w_2}+\frac{\partial \hat{F}_2}{\partial w_2}
\end{aligned}
$$

Ahora para el segundo sistema

$$
\hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)=F_1\left(z_1,z_2;\zeta_1\right)\hat{F}_1\left(\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)
$$

entonces

$$
\begin{aligned}
\frac{\partial \hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{F}_1}{\partial w_1}\cdot\frac{\partial\hat{\theta}_1}{\partial P_1}\cdot\frac{\partial P_1}{\partial z_1}+\frac{\partial F_1}{\partial z_1}\\
\frac{\partial \hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{F}_1}{\partial w_1}\cdot\frac{\partial\hat{\theta}_1}{\partial \tilde{P}_2}\cdot\frac{\partial \tilde{P}_2}{\partial z_2}+\frac{\partial F_1}{\partial z_2}\\
\frac{\partial \hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= 0\\
\frac{\partial \hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{F}_1}{\partial w_1}\cdot\frac{\partial\hat{\theta}_1}{\partial \tilde{P}_2}\cdot\frac{\partial \hat{P}_2}{\partial w_2}+\frac{\partial \hat{F}_1}{\partial w_2}
\end{aligned}
$$

Finalmente para ζ_2

$$
\hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right) = F_2\left(z_1,z_2;\zeta_2\right)\hat{F}_2\left(w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right]
$$

por tanto:

$$
\begin{aligned}
\frac{\partial \hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{F}_2}{\partial w_2}\cdot\frac{\partial\hat{\theta}_2}{\partial P_1}\cdot\frac{\partial P_1}{\partial z_1}+\frac{\partial F_2}{\partial z_1}\\
\frac{\partial \hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{F}_2}{\partial w_2}\cdot\frac{\partial\hat{\theta}_2}{\partial \tilde{P}_2}\cdot\frac{\partial \tilde{P}_2}{\partial z_2}+\frac{\partial F_2}{\partial z_2}\\
\frac{\partial \hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{F}_2}{\partial w_2}\cdot\frac{\partial\hat{\theta}_2}{\partial \hat{P}_1}\cdot\frac{\partial \hat{P}_1}{\partial w_1}+\frac{\partial \hat{F}_2}{\partial w_1}\\
\frac{\partial \hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= 0
\end{aligned}
$$

36.58.3. Ecuaciones Recursivas

Entonces, de todo lo desarrollado hasta ahora se tienen las siguientes ecuaciones:

$$
\begin{aligned}
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= r_1\mu_1 \\
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= = r_1\tilde{\mu}_2 + f_1(1)\left(\frac{1}{1-\mu_1}\right)\tilde{\mu}_2 + f_1(2) \\
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= r_1\hat{\mu}_1 + f_1(1)\left(\frac{1}{1-\mu_1}\right)\hat{\mu}_1 + \hat{F}^{(1)}_{1,1}(1) \\
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= r_1\hat{\mu}_2 + f_1(1)\left(\frac{1}{1-\mu_1}\right)\hat{\mu}_2 + \hat{F}^{(1)}_{2,1}(1) \\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= r_2\mu_1 + f_2(2)\left(\frac{1}{1-\tilde{\mu}_2}\right)\mu_1 + f_2(1) \\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= r_2\tilde{\mu}_2 \\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= r_2\hat{\mu}_1 + f_2(2)\left(\frac{1}{1-\tilde{\mu}_2}\right)\hat{\mu}_1 + \hat{F}^{(1)}_{2,1}(1) \\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= r_2\hat{\mu}_2 + f_2(2)\left(\frac{1}{1-\tilde{\mu}_2}\right)\hat{\mu}_2 + \hat{F}^{(1)}_{2,2}(1) \\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_1\mu_1 + \hat{f}_1(1)\left(\frac{1}{1-\hat{\mu}_1}\right)\mu_1 + F^{(1)}_{1,1}(1) \\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_1\mu_2 + \hat{f}_1(1)\left(\frac{1}{1-\hat{\mu}_1}\right)\tilde{\mu}_2 + F^{(1)}_{2,1}(1) \\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_1\hat{\mu}_1 \\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_1\hat{\mu}_2 + \hat{f}_1(1)\left(\frac{1}{1-\hat{\mu}_1}\right)\hat{\mu}_2 + \hat{f}_1(2) \\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_2\mu_1 + \hat{f}_2(1)\left(\frac{1}{1-\hat{\mu}_2}\right)\mu_1 + F^{(1)}_{1,2}(1) \\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_2\tilde{\mu}_2 + \hat{f}_2(2)\left(\frac{1}{1-\hat{\mu}_2}\right)\tilde{\mu}_2 + F^{(1)}_{2,2}(1) \\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_2\hat{\mu}_1 + \hat{f}_2(2)\left(\frac{1}{1-\hat{\mu}_2}\right)\hat{\mu}_1 + \hat{f}_2(1) \\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_2\hat{\mu}_2
\end{aligned}
$$

Es decir, se tienen las siguientes ecuaciones:

$$
\begin{aligned}
f_2(1) &= r_1\mu_1 \\
f_1(2) &= r_2\tilde{\mu}_2 \\
f_2(2) &= r_1\tilde{\mu}_2 + \tilde{\mu}_2\left(\frac{f_1(1)}{1-\mu_1}\right) + f_1(2) = \left(r_1 + \frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2 + r_2\tilde{\mu}_2 \\
&= \left(r_1 + r_2 + \frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2 = \left(r + \frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2 \\
f_2(3) &= r_1\hat{\mu}_1 + \hat{\mu}_1\left(\frac{f_1(1)}{1-\mu_1}\right) + \hat{F}^{(1)}_{1,1}(1) = \hat{\mu}_1\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_1}{\mu_1} \\
f_2(4) &= r_1\hat{\mu}_2 + \hat{\mu}_2\left(\frac{f_1(1)}{1-\mu_1}\right) + \hat{F}^{(1)}_{2,1}(1) = \hat{\mu}_2\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_2}{\mu_1} \\
f_1(1) &= r_2\mu_1 + \mu_1\left(\frac{f_2(2)}{1-\tilde{\mu}_2}\right) + r_1\mu_1 = \mu_1\left(r_1 + r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) \\
&= \mu_1\left(r + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) \\
f_1(3) &= r_2\hat{\mu}_1 + \hat{\mu}_1\left(\frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \hat{F}^{(1)}_{1,2}(1) = \hat{\mu}_1\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_1}{\mu_2} \\
f_1(4) &= r_2\hat{\mu}_2 + \hat{\mu}_2\left(\frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \hat{F}^{(1)}_{2,2}(1) = \hat{\mu}_2\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_2}{\mu_2} \\
\hat{f}_1(4) &= \hat{r}_2\hat{\mu}_2 \\
\hat{f}_2(3) &= \hat{r}_1\hat{\mu}_1 \\
\hat{f}_1(1) &= \hat{r}_2\mu_1 + \mu_1\left(\frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right) + F^{(1)}_{1,2}(1) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\mu_1 + \frac{\mu_1}{\hat{\mu}_2} \\
\hat{f}_1(2) &= \hat{r}_2\tilde{\mu}_2 + \tilde{\mu}_2\left(\frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right) + F^{(1)}_{2,2}(1) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\tilde{\mu}_2 + \frac{\mu_2}{\hat{\mu}_2} \\
\hat{f}_1(3) &= \hat{r}_2\hat{\mu}_1 + \hat{\mu}_1\left(\frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right) + \hat{f}_2(3) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 + \hat{r}_1\hat{\mu}_1 \\
&= \left(\hat{r}_1 + \hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 = \left(\hat{r} + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 \\
\hat{f}_2(1) &= \hat{r}_1\mu_1 + \mu_1\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + F^{(1)}_{1,1}(1) = \left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\mu_1 + \frac{\mu_1}{\hat{\mu}_1} \\
\hat{f}_2(2) &= \hat{r}_1\tilde{\mu}_2 + \tilde{\mu}_2\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + F^{(1)}_{2,1}(1) = \left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\tilde{\mu}_2 + \frac{\mu_2}{\hat{\mu}_1} \\
\hat{f}_2(4) &= \hat{r}_1\hat{\mu}_2 + \hat{\mu}_2\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + \hat{f}_1(4) = \hat{r}_1\hat{\mu}_2 + \hat{r}_2\hat{\mu}_2 + \hat{\mu}_2\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) \\
&= \left(\hat{r} + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\hat{\mu}_2
\end{aligned}
$$

es decir,

$$
\begin{array}{lll}
f_1(1) = \mu_1\left(r + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) & f_1(2) = r_2\tilde{\mu}_2 & f_1(3) = \hat{\mu}_1\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_1}{\mu_2} \\
f_1(4) = \hat{\mu}_2\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_2}{\mu_2} & f_2(1) = r_1\mu_1 & f_2(2) = \left(r + \frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2 \\
f_2(3) = \hat{\mu}_1\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_1}{\mu_1} & f_2(4) = \hat{\mu}_2\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_2}{\mu_1} & \hat{f}_1(1) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\mu_1 + \frac{\mu_1}{\hat{\mu}_2} \\
\hat{f}_1(2) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\tilde{\mu}_2 + \frac{\mu_2}{\hat{\mu}_2} & \hat{f}_1(3) = \left(\hat{r} + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 & \hat{f}_1(4) = \hat{r}_2\hat{\mu}_2 \\
\hat{f}_2(1) = \left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\mu_1 + \frac{\mu_1}{\hat{\mu}_1} & \hat{f}_2(2) = \left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\tilde{\mu}_2 + \frac{\mu_2}{\hat{\mu}_1} & \hat{f}_2(3) = \hat{r}_1\hat{\mu}_1 \\
 & \hat{f}_2(4) = \left(\hat{r} + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\hat{\mu}_2 &
\end{array}
$$

36.58.4. Solución del Sistema de Ecuaciones Lineales

A saber, se puede demostrar que la solución del sistema de ecuaciones está dado por las siguientes expresiones, donde

$$\mu = \mu_1 + \tilde{\mu}_2 \ , \ \hat{\mu} = \hat{\mu}_1 + \hat{\mu}_2 \ , \ r = r_1 + r_2 \text{ y } \hat{r} = \hat{r}_1 + \hat{r}_2$$

entonces

$$
\begin{array}{lll}
f_1(1) = r\frac{\mu_1(1-\mu_1)}{1-\mu} & f_1(3) = \hat{\mu}_1\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right) & f_1(4) = \hat{\mu}_2\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right) \\
f_2(2) = r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu} & f_2(3) = \hat{\mu}_1\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right) & f_2(4) = \hat{\mu}_2\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right) \\
\hat{f}_1(1) = \mu_1\left(\frac{\hat{r}_2\hat{\mu}_2+1}{\hat{\mu}_2} + \hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right) & \hat{f}_1(2) = \tilde{\mu}_2\left(\hat{r}_2 + \hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right) + \frac{\mu_2}{\tilde{\mu}_2} & \hat{f}_1(3) = \hat{r}\frac{\hat{\mu}_1(1-\hat{\mu}_1)}{1-\hat{\mu}} \\
\hat{f}_2(1) = \mu_1\left(\frac{\hat{r}_1\hat{\mu}_1+1}{\hat{\mu}_1} + \hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right) & \hat{f}_2(2) = \tilde{\mu}_2\left(\hat{r}_1 + \hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right) + \frac{\mu_2}{\tilde{\mu}_1} & \hat{f}_2(4) = \hat{r}\frac{\hat{\mu}_2(1-\hat{\mu}_2)}{1-\hat{\mu}}
\end{array}
$$

A saber

$$
\begin{aligned}
f_1(3) &= \hat{\mu}_1\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_1}{\mu_2} = \hat{\mu}_1\left(r_2 + \frac{r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu}}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_1}{\mu_2} = \hat{\mu}_1\left(r_2 + \frac{r\tilde{\mu}_2}{1-\mu}\right) + \frac{\hat{\mu}_1}{\mu_2} \\
&= \hat{\mu}_1\left(r_2 + \frac{r\tilde{\mu}_2}{1-\mu} + \frac{1}{\mu_2}\right) = \hat{\mu}_1\left(\frac{r_2\mu_2+1}{\mu_2} + \frac{r\tilde{\mu}_2}{1-\mu}\right)
\end{aligned}
$$

$$
\begin{aligned}
f_1(4) &= \hat{\mu}_2\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_2}{\mu_2} = \hat{\mu}_2\left(r_2 + \frac{r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu}}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_2}{\mu_2} = \hat{\mu}_2\left(r_2 + \frac{r\tilde{\mu}_2}{1-\mu}\right) + \frac{\hat{\mu}_1}{\mu_2} \\
&= \hat{\mu}_2\left(r_2 + \frac{r\tilde{\mu}_2}{1-\mu} + \frac{1}{\mu_2}\right) = \hat{\mu}_2\left(\frac{r_2\mu_2+1}{\mu_2} + \frac{r\tilde{\mu}_2}{1-\mu}\right)
\end{aligned}
$$

$$
\begin{aligned}
f_2(3) &= \hat{\mu}_1\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_1}{\mu_1} = \hat{\mu}_1\left(r_1 + \frac{r\frac{\mu_1(1-\mu_1)}{1-\mu}}{1-\mu_1}\right) + \frac{\hat{\mu}_1}{\mu_1} = \hat{\mu}_1\left(r_1 + \frac{r\mu_1}{1-\mu}\right) + \frac{\hat{\mu}_1}{\mu_1} \\
&= \hat{\mu}_1\left(r_1 + \frac{r\mu_1}{1-\mu} + \frac{1}{\mu_1}\right) = \hat{\mu}_1\left(\frac{r_1\mu_1+1}{\mu_1} + \frac{r\mu_1}{1-\mu}\right)
\end{aligned}
$$

$$
\begin{aligned}
f_2(4) &= \hat{\mu}_2\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_2}{\mu_1} = \hat{\mu}_2\left(r_1 + \frac{r\frac{\mu_1(1-\mu_1)}{1-\mu}}{1-\mu_1}\right) + \frac{\hat{\mu}_1}{\mu_1} = \hat{\mu}_2\left(r_1 + \frac{r\mu_1}{1-\mu}\right) + \frac{\hat{\mu}_1}{\mu_1} \\
&= \hat{\mu}_2\left(r_1 + \frac{r\mu_1}{1-\mu} + \frac{1}{\mu_1}\right) = \hat{\mu}_2\left(\frac{r_1\mu_1+1}{\mu_1} + \frac{r\mu_1}{1-\mu}\right)
\end{aligned}
$$

$$
\begin{aligned}
\hat{f}_1(1) &= \mu_1\left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\tilde{\mu}_2}\right) + \frac{\mu_1}{\hat{\mu}_2} = \mu_1\left(\hat{r}_2 + \frac{\hat{r}\frac{\hat{\mu}_2(1-\hat{\mu}_2)}{1-\hat{\mu}}}{1-\hat{\mu}_2}\right) + \frac{\mu_1}{\hat{\mu}_2} = \mu_1\left(\hat{r}_2 + \frac{\hat{r}\hat{\mu}_2}{1-\hat{\mu}}\right) + \frac{\mu_1}{\mu_2} \\
&= \mu_1\left(\hat{r}_2 + \frac{\hat{r}\mu_2}{1-\hat{\mu}} + \frac{1}{\hat{\mu}_2}\right) = \mu_1\left(\frac{\hat{r}_2\hat{\mu}_2+1}{\hat{\mu}_2} + \frac{\hat{r}\hat{\mu}_2}{1-\hat{\mu}}\right)
\end{aligned}
$$

$$
\hat{f}_1(2) = \tilde{\mu}_2\left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\tilde{\mu}_2}\right) + \frac{\mu_2}{\hat{\mu}_2} = \tilde{\mu}_2\left(\hat{r}_2 + \frac{\hat{r}\frac{\hat{\mu}_2(1-\hat{\mu}_2)}{1-\hat{\mu}}}{1-\hat{\mu}_2}\right) + \frac{\mu_2}{\hat{\mu}_2} = \tilde{\mu}_2\left(\hat{r}_2 + \frac{\hat{r}\hat{\mu}_2}{1-\hat{\mu}}\right) + \frac{\mu_2}{\hat{\mu}_2}
$$

$$
\begin{aligned}
\hat{f}_2(1) &= \mu_1\left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + \frac{\mu_1}{\hat{\mu}_1} = \mu_1\left(\hat{r}_1 + \frac{\hat{r}\frac{\hat{\mu}_1(1-\hat{\mu}_1)}{1-\hat{\mu}}}{1-\hat{\mu}_1}\right) + \frac{\mu_1}{\hat{\mu}_1} = \mu_1\left(\hat{r}_1 + \frac{\hat{r}\hat{\mu}_1}{1-\hat{\mu}}\right) + \frac{\mu_1}{\hat{\mu}_1} \\
&= \mu_1\left(\hat{r}_1 + \frac{\hat{r}\hat{\mu}_1}{1-\hat{\mu}} + \frac{1}{\hat{\mu}_1}\right) = \mu_1\left(\frac{\hat{r}_1\hat{\mu}_1+1}{\hat{\mu}_1} + \frac{\hat{r}\hat{\mu}_1}{1-\hat{\mu}}\right)
\end{aligned}
$$

$$
\hat{f}_2(2) = \tilde{\mu}_2\left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\tilde{\mu}_1}\right) + \frac{\mu_2}{\hat{\mu}_1} = \tilde{\mu}_2\left(\hat{r}_1 + \frac{\hat{r}\frac{\hat{\mu}_1(1-\hat{\mu}_1)}{1-\hat{\mu}}}{1-\hat{\mu}_1}\right) + \frac{\mu_2}{\hat{\mu}_1} = \tilde{\mu}_2\left(\hat{r}_1 + \frac{\hat{r}\hat{\mu}_1}{1-\hat{\mu}}\right) + \frac{\mu_2}{\hat{\mu}_1}
$$

36.59. Resultado Principal

Sean $\mu_1, \mu_2, \check{\mu}_2, \hat{\mu}_1, \hat{\mu}_2$ y $\tilde{\mu}_2 = \mu_2 + \check{\mu}_2$ los valores esperados de los proceso definidos anteriormente, y sean $r_1, r_2, \hat{r}_1$ y $\hat{r}_2$ los valores esperado s de los tiempos de traslado del servidor entre las colas para cada uno de los sistemas de visitas cíclicas. Si se definen $\mu = \mu_1 + \tilde{\mu}_2$, $\hat{\mu} = \hat{\mu}_1 + \hat{\mu}_2$, y $r = r_1 + r_2$ y $\hat{r} = \hat{r}_1 + \hat{r}_2$, entonces se tiene el siguiente resultado.

Teorema 36.59.1 *Supongamos que $\mu < 1$, $\hat{\mu} < 1$, entonces, el número de usuarios presentes en cada una de las colas que conforman la Red de Sistemas de Visitas Cíclicas cuando uno de los servidores visita a alguna de ellas está dada por la solución del Sistema de Ecuaciones Lineales presentados arriba cuyas expresiones damos a continuación:*

$$\begin{array}{lll}
f_1(1) = r\frac{\mu_1(1-\mu_1)}{1-\mu}, & f_1(2) = r_2\tilde{\mu}_2, & f_1(3) = \hat{\mu}_1\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right), \\
f_1(4) = \hat{\mu}_2\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right), & f_2(1) = r_1\mu_1, & f_2(2) = r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu}, \\
f_2(3) = \hat{\mu}_1\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right), & f_2(4) = \hat{\mu}_2\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right), & \hat{f}_1(1) = \mu_1\left(\frac{\hat{r}_2\hat{\mu}_2+1}{\hat{\mu}_2} + \hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right), \\
\hat{f}_1(2) = \tilde{\mu}_2\left(\hat{r}_2 + \hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right) + \frac{\mu_2}{\hat{\mu}_2}, & \hat{f}_1(3) = \hat{r}\frac{\hat{\mu}_1(1-\hat{\mu}_1)}{1-\hat{\mu}}, & \hat{f}_1(4) = \hat{r}_2\hat{\mu}_2, \\
\hat{f}_2(1) = \mu_1\left(\frac{\hat{r}_1\hat{\mu}_1+1}{\hat{\mu}_1} + \hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right), & \hat{f}_2(2) = \tilde{\mu}_2\left(\hat{r}_1 + \hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right) + \frac{\hat{\mu}_2}{\hat{\mu}_1}, & \hat{f}_2(3) = \hat{r}_1\hat{\mu}_1, \\
 & \hat{f}_2(4) = \hat{r}\frac{\hat{\mu}_2(1-\hat{\mu}_2)}{1-\hat{\mu}}. &
\end{array}$$

36.60. Segundos Momentos

Para poder determinar los segundos momentos para los tiempos de traslado del servidor es necesaria la siguiente proposición:

Proposición 36.60.1 *Sea $f(g(x)h(y))$ función continua tal que tiene derivadas parciales mixtas de segundo orden, entonces se tiene lo siguiente:*

$$\frac{\partial}{\partial x} f(g(x)h(y)) = \frac{\partial f(g(x)h(y))}{\partial x} \cdot \frac{\partial g(x)}{\partial x} \cdot h(y)$$

por tanto

$$\frac{\partial}{\partial x}\frac{\partial}{\partial x} f(g(x)h(y)) = \frac{\partial^2}{\partial x} f(g(x)h(y)) \cdot \left(\frac{\partial g(x)}{\partial x}\right)^2 \cdot h^2(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g^2(x)}{\partial x^2} \cdot h(y) \quad (36.60.1)$$

y

$$\frac{\partial}{\partial y}\frac{\partial}{\partial x} f(g(x)h(y)) = \frac{\partial g(x)}{\partial x} \cdot \frac{\partial h(y)}{\partial y}\left\{\frac{\partial^2}{\partial y \partial x} f(g(x)h(y)) \cdot g(x) \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y))\right\}$$

Demostración 36.60.1

$$\begin{aligned}
\frac{\partial}{\partial x}\frac{\partial}{\partial x} f(g(x)h(y)) &= \frac{\partial}{\partial x}\left\{\frac{\partial f(g(x)h(y))}{\partial x} \cdot \frac{\partial g(x)}{\partial x} \cdot h(y)\right\} \\
&= \frac{\partial}{\partial x}\left\{\frac{\partial}{\partial x} f(g(x)h(y))\right\} \cdot \frac{\partial g(x)}{\partial x} \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g^2(x)}{\partial x^2} \cdot h(y) \\
&= \frac{\partial^2}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g(x)}{\partial x} \cdot h(y) \cdot \frac{\partial g(x)}{\partial x} \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g^2(x)}{\partial x^2} \cdot h(y) \\
&= \frac{\partial^2}{\partial x} f(g(x)h(y)) \cdot \left(\frac{\partial g(x)}{\partial x}\right)^2 \cdot h^2(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g^2(x)}{\partial x^2} \cdot h(y).
\end{aligned}$$

Por otra parte:

$$\begin{aligned}
\frac{\partial}{\partial y}\frac{\partial}{\partial x} f(g(x)h(y)) &= \frac{\partial}{\partial y}\left\{\frac{\partial f(g(x)h(y))}{\partial x} \cdot \frac{\partial g(x)}{\partial x} \cdot h(y)\right\} \\
&= \frac{\partial}{\partial y}\left\{\frac{\partial}{\partial x} f(g(x)h(y))\right\} \cdot \frac{\partial g(x)}{\partial x} \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g(x)}{\partial x} \cdot \frac{\partial h(y)}{y} \\
&= \frac{\partial^2}{\partial y \partial x} f(g(x)h(y)) \cdot \frac{\partial h(y)}{\partial y} \cdot g(x) \cdot \frac{\partial g(x)}{\partial x} \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g(x)}{\partial x} \cdot \frac{\partial h(y)}{\partial y} \\
&= \frac{\partial g(x)}{\partial x} \cdot \frac{\partial h(y)}{\partial y}\left\{\frac{\partial^2}{\partial y \partial x} f(g(x)h(y)) \cdot g(x) \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y))\right\}
\end{aligned}$$

Utilizando la proposición anterior (Proposiciíon 36.85.1)se tiene el siguiente resultado que me dice como calcular los segundos momentos para los procesos de traslado del servidor:

Proposición 36.60.2 *Sea R_i la Función Generadora de Probabilidades para el número de arribos a cada una de las colas de la Red de Sistemas de Visitas Cíclicas definidas como en (36.84.4). Entonces las derivadas parciales están dadas por las siguientes expresiones:*

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_i^2} &= \left(\frac{\partial P_i(z_i)}{\partial z_i}\right)^2\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial^2 z_i}\\ &+ \left(\frac{\partial P_i(z_i)}{\partial z_i}\right)^2\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_i}\end{aligned}$$

y además

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_2\partial z_1} &= \frac{\partial\tilde{P}_2(z_2)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_2\partial z_1}\\ &+ \frac{\partial\tilde{P}_2(z_2)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_1},\end{aligned}$$

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_1} &= \frac{\partial\hat{P}_i(w_i)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_1}\\ &+ \frac{\partial\hat{P}_i(w_i)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_1},\end{aligned}$$

finalmente

36.61. Medidas de Desempeño

Definición 36.61.1 *Sea L_i^* el número de usuarios cuando el servidor visita la cola Q_i para dar servicio, para $i = 1, 2$.*

Entonces

Proposición 36.61.1 *Para la cola Q_i, $i = 1, 2$, se tiene que el número de usuarios presentes al momento de ser visitada por el servidor está dado por*

$$\mathbb{E}[L_i^*] = f_i(i) \tag{36.61.1}$$

$$Var[L_i^*] = f_i(i,i) + \mathbb{E}[L_i^*] - \mathbb{E}[L_i^*]^2. \tag{36.61.2}$$

Definición 36.61.2 *El tiempo de Ciclo C_i es el periodo de tiempo que comienza cuando la cola i es visitada por primera vez en un ciclo, y termina cuando es visitado nuevamente en el próximo ciclo, bajo condiciones de estabilidad.*

$$C_i(z) = \mathbb{E}\left[z^{\overline{\tau}_i(m+1) - \overline{\tau}_i(m)}\right]$$

Definición 36.61.3 *El tiempo de intervisita I_i es el periodo de tiempo que comienza cuando se ha completado el servicio en un ciclo y termina cuando es visitada nuevamente en el próximo ciclo.*

$$I_i(z) = \mathbb{E}\left[z^{\tau_i(m+1)-\overline{\tau}_i(m)}\right]$$

Proposición 36.61.2 *Para los tiempos de intervisita del servidor I_i, se tiene que*

$$\begin{aligned}
\mathbb{E}[I_i] &= \frac{f_i(i)}{\mu_i}, \\
Var[I_i] &= \frac{Var\left[L_i^*\right]}{\mu_i^2} - \frac{\sigma_i^2}{\mu_i^2} f_i(i).
\end{aligned}$$

Proposición 36.61.3 *Para los tiempos que ocupa el servidor para atender a los usuarios presentes en la cola Q_i, con FGP denotada por S_i, se tiene que*

$$\begin{aligned}
\mathbb{E}[S_i] &= \frac{\mathbb{E}\left[L_i^*\right]}{1-\mu_i} = \frac{f_i(i)}{1-\mu_i}, \\
Var[S_i] &= \frac{Var\left[L_i^*\right]}{(1-\mu_i)^2} + \frac{\sigma^2 \mathbb{E}\left[L_i^*\right]}{(1-\mu_i)^3}
\end{aligned}$$

Proposición 36.61.4 *Para la duración de los ciclos C_i se tiene que*

$$\begin{aligned}
\mathbb{E}[C_i] &= \mathbb{E}[I_i]\,\mathbb{E}[\theta_i(z)] = \frac{\mathbb{E}\left[L_i^*\right]}{\mu_i}\frac{1}{1-\mu_i} = \frac{f_i(i)}{\mu_i(1-\mu_i)} \\
Var[C_i] &= \frac{Var\left[L_i^*\right]}{\mu_i^2(1-\mu_i)^2}.
\end{aligned}$$

\end{aligned}$$

Las ecuaciones que determinan los segundos momentos de las longitudes de las colas de los dos sistemas se pueden ver en este sitio

Apéndice B

Distribución para los usuarios de traslado

Se puede demostrar que

$$\frac{d^k}{dy}\left(\frac{\lambda+\mu}{\lambda+\mu-y}\right)=\frac{k!}{(\lambda+\mu)^k} \tag{36.61.3}$$

Proposición 36.61.5 *Sea τ variable aleatoria no negativa con distribución exponencial con media μ, y sea $L(t)$ proceso Poisson con parámetro λ. Entonces*

$$\mathbb{P}\{L(\tau)=k\}=f_{L(\tau)}(k)=\left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)^{k}. \tag{36.61.4}$$

Además

$$\mathbb{E}[L(\tau)] = \frac{\lambda}{\mu} \tag{36.61.5}$$

$$\mathbb{E}\left[(L(\tau))^2\right] = \frac{\lambda}{\mu}\left(2\frac{\lambda}{\mu}+1\right) \tag{36.61.6}$$

$$V[L(\tau)] = \frac{\lambda}{\mu}\left(\frac{\lambda}{\mu}+1\right). \tag{36.61.7}$$

A saber, para k fijo se tiene que

$$\begin{aligned}
\mathbb{P}\{L(\tau)=k\} &= \mathbb{P}\{L(\tau)=k,\tau\in(0,\infty)\}\\
&= \int_0^\infty \mathbb{P}\{L(\tau)=k,\tau=y\}f_\tau(y)\,dy=\int_0^\infty \mathbb{P}\{L(y)=k\}f_\tau(y)\,dy\\
&= \int_0^\infty \frac{e^{-\lambda y}}{k!}(\lambda y)^k\left(\mu e^{-\mu y}\right)dy=\frac{\lambda^k\mu}{k!}\int_0^\infty y^k e^{-(\mu+\lambda)y}dy\\
&= \frac{\lambda^k\mu}{(\lambda+\mu)\,k!}\int_0^\infty y^k(\lambda+\mu)\,e^{-(\lambda+\mu)y}dy=\frac{\lambda^k\mu}{(\lambda+\mu)\,k!}\int_0^\infty y^k f_Y(y)\,dy\\
&= \frac{\lambda^k\mu}{(\lambda+\mu)\,k!}\mathbb{E}\left[Y^k\right]=\frac{\lambda^k\mu}{(\lambda+\mu)\,k!}\frac{d^k}{dy}\left(\frac{\lambda+\mu}{\lambda+\mu-y}\right)|_{y=0}\\
&= \frac{\lambda^k\mu}{(\lambda+\mu)\,k!}\frac{k!}{(\lambda+\mu)^k}=\left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)^k.
\end{aligned}$$

Además

$$\begin{aligned}
\sum_{k=0}^\infty \mathbb{P}\{L(\tau)=k\} &= \sum_{k=0}^\infty\left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)^k=\frac{\mu}{\lambda+\mu}\sum_{k=0}^\infty\left(\frac{\lambda}{\lambda+\mu}\right)^k\\
&= \frac{\mu}{\lambda+\mu}\left(\frac{1}{1-\frac{\lambda}{\lambda+\mu}}\right)=\frac{\mu}{\lambda+\mu}\left(\frac{\lambda+\mu}{\mu}\right)\\
&= 1.
\end{aligned}$$

determinemos primero la esperanza de $L(\tau)$:

$$\begin{aligned}
\mathbb{E}[L(\tau)] &= \sum_{k=0}^\infty k\mathbb{P}\{L(\tau)=k\}=\sum_{k=0}^\infty k\left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)^k\\
&= \left(\frac{\mu}{\lambda+\mu}\right)\sum_{k=0}^\infty k\left(\frac{\lambda}{\lambda+\mu}\right)^k=\left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)\sum_{k=1}^\infty k\left(\frac{\lambda}{\lambda+\mu}\right)^{k-1}\\
&= \frac{\mu\lambda}{(\lambda+\mu)^2}\left(\frac{1}{1-\frac{\lambda}{\lambda+\mu}}\right)^2=\frac{\mu\lambda}{(\lambda+\mu)^2}\left(\frac{\lambda+\mu}{\mu}\right)^2\\
&= \frac{\lambda}{\mu}.
\end{aligned}$$

Ahora su segundo momento:

$$\begin{aligned}
\mathbb{E}\left[(L(\tau))^2\right] &= \sum_{k=0}^{\infty} k^2 \mathbb{P}\{L(\tau)=k\} = \sum_{k=0}^{\infty} k^2 \left(\frac{\mu}{\lambda+\mu}\right)\left(\frac{\lambda}{\lambda+\mu}\right)^k \\
&= \left(\frac{\mu}{\lambda+\mu}\right)\sum_{k=0}^{\infty} k^2 \left(\frac{\lambda}{\lambda+\mu}\right)^k = \frac{\mu\lambda}{(\lambda+\mu)^2}\sum_{k=2}^{\infty}(k-1)^2\left(\frac{\lambda}{\lambda+\mu}\right)^{k-2} \\
&= \frac{\mu\lambda}{(\lambda+\mu)^2}\left(\frac{\frac{\lambda}{\lambda+\mu}+1}{\left(\frac{\lambda}{\lambda+\mu}-1\right)^3}\right) = \frac{\mu\lambda}{(\lambda+\mu)^2}\left(-\frac{\frac{2\lambda+\mu}{\lambda+\mu}}{\left(-\frac{\mu}{\lambda+\mu}\right)^3}\right) \\
&= \frac{\mu\lambda}{(\lambda+\mu)^2}\left(\frac{2\lambda+\mu}{\lambda+\mu}\right)\left(\frac{\lambda+\mu}{\mu}\right)^3 = \frac{\lambda(2\lambda+\mu)}{\mu^2} \\
&= \frac{\lambda}{\mu}\left(2\frac{\lambda}{\mu}+1\right).
\end{aligned}$$

y por tanto

$$\begin{aligned}
V[L(\tau)] &= \frac{\lambda(2\lambda+\mu)}{\mu^2} - \left(\frac{\lambda}{\mu}\right)^2 = \frac{\lambda^2+\mu\lambda}{\mu^2} \\
&= \frac{\lambda}{\mu}\left(\frac{\lambda}{\mu}+1\right).
\end{aligned}$$

Ahora, determinemos la distribución del número de usuarios que pasan de $\hat{Q}_2$ a Q_2 considerando dos políticas de traslado en específico:

1. Solamente pasa un usuario,
2. Se permite el paso de k usuarios,

una vez que son atendidos por el servidor en $\hat{Q}_2$.

Política de un solo usuario: Sea R_2 el número de usuarios que llegan a $\hat{Q}_2$ al tiempo t, sea R_1 el número de usuarios que pasan de $\hat{Q}_2$ a Q_2 al tiempo t.

A saber:

$$\begin{aligned}
\mathbb{E}[R_1] &= \sum_{y\geq 0}\mathbb{P}[R_2=y]\,\mathbb{E}[R_1|R_2=y] \\
&= \sum_{y\geq 0}\mathbb{P}[R_2=y]\sum_{x\geq 0} x\mathbb{P}[R_1=x|R_2=y] \\
&= \sum_{y\geq 0}\sum_{x\geq 0} x\mathbb{P}[R_1=x|R_2=y]\,\mathbb{P}[R_2=y].
\end{aligned}$$

Determinemos

$$\mathbb{E}[R_1|R_2=y] = \sum_{x\geq 0} x\mathbb{P}[R_1=x|R_2=y]. \tag{36.61.8}$$

supongamos que $y=0$, entonces

$$\begin{aligned}
\mathbb{P}[R_1=0|R_2=0] &= 1, \\
\mathbb{P}[R_1=x|R_2=0] &= 0, \text{ para cualquier } x\geq 1,
\end{aligned}$$

por tanto

$$\mathbb{E}[R_1|R_2=0]=0.$$

Para $y=1$,

$$\begin{aligned}
\mathbb{P}[R_1=0|R_2=1] &= 0, \\
\mathbb{P}[R_1=1|R_2=1] &= 1,
\end{aligned}$$

entonces

$$\mathbb{E}[R_1|R_2=1]=1.$$

Para $y > 1$:

$$\begin{aligned}
\mathbb{P}\left[R_1 = 0 | R_2 \geq 1\right] &= 0, \\
\mathbb{P}\left[R_1 = 1 | R_2 \geq 1\right] &= 1, \\
\mathbb{P}\left[R_1 > 1 | R_2 \geq 1\right] &= 0,
\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1 | R_2 = y\right] = 1, \text{ para cualquier } y > 1.$$

es decir

$$\mathbb{E}\left[R_1 | R_2 = y\right] = 1, \text{ para cualquier } y \geq 1.$$

Entonces

$$\begin{aligned}
\mathbb{E}\left[R_1\right] &= \sum_{y \geq 0} \sum_{x \geq 0} x \mathbb{P}\left[R_1 = x | R_2 = y\right] \mathbb{P}\left[R_2 = y\right] = \sum_{y \geq 0} \sum_{x} \mathbb{E}\left[R_1 | R_2 = y\right] \mathbb{P}\left[R_2 = y\right] \\
&= \sum_{y \geq 0} \mathbb{P}\left[R_2 = y\right] = \sum_{y \geq 1} \frac{(\lambda t)^k}{k!} e^{-\lambda t} = 1.
\end{aligned}$$

Además para $k \in Z^+$

$$\begin{aligned}
f_{R_1}(k) &= \mathbb{P}\left[R_1 = k\right] = \sum_{n=0}^{\infty} \mathbb{P}\left[R_1 = k | R_2 = n\right] \mathbb{P}\left[R_2 = n\right] \\
&= \mathbb{P}\left[R_1 = k | R_2 = 0\right] \mathbb{P}\left[R_2 = 0\right] + \mathbb{P}\left[R_1 = k | R_2 = 1\right] \mathbb{P}\left[R_2 = 1\right] \\
&+ \mathbb{P}\left[R_1 = k | R_2 > 1\right] \mathbb{P}\left[R_2 > 1\right],
\end{aligned}$$

donde para

$k = 0$**:**

$$\begin{aligned}
\mathbb{P}\left[R_1 = 0\right] = \mathbb{P}\left[R_1 = 0 | R_2 = 0\right] \mathbb{P}\left[R_2 = 0\right] + \mathbb{P}\left[R_1 = 0 | R_2 = 1\right] \mathbb{P}\left[R_2 = 1\right] \\
+ \mathbb{P}\left[R_1 = 0 | R_2 > 1\right] \mathbb{P}\left[R_2 > 1\right] = \mathbb{P}\left[R_2 = 0\right].
\end{aligned}$$

$k = 1$**:**

$$\begin{aligned}
\mathbb{P}\left[R_1 = 1\right] = \mathbb{P}\left[R_1 = 1 | R_2 = 0\right] \mathbb{P}\left[R_2 = 0\right] + \mathbb{P}\left[R_1 = 1 | R_2 = 1\right] \mathbb{P}\left[R_2 = 1\right] \\
+ \mathbb{P}\left[R_1 = 1 | R_2 > 1\right] \mathbb{P}\left[R_2 > 1\right] = \sum_{n=1}^{\infty} \mathbb{P}\left[R_2 = n\right].
\end{aligned}$$

$k = 2$**:**

$$\begin{aligned}
\mathbb{P}\left[R_1 = 2\right] = \mathbb{P}\left[R_1 = 2 | R_2 = 0\right] \mathbb{P}\left[R_2 = 0\right] + \mathbb{P}\left[R_1 = 2 | R_2 = 1\right] \mathbb{P}\left[R_2 = 1\right] \\
+ \mathbb{P}\left[R_1 = 2 | R_2 > 1\right] \mathbb{P}\left[R_2 > 1\right] = 0.
\end{aligned}$$

$k = j$**:**

$$\begin{aligned}
\mathbb{P}\left[R_1 = j\right] = \mathbb{P}\left[R_1 = j | R_2 = 0\right] \mathbb{P}\left[R_2 = 0\right] + \mathbb{P}\left[R_1 = j | R_2 = 1\right] \mathbb{P}\left[R_2 = 1\right] \\
+ \mathbb{P}\left[R_1 = j | R_2 > 1\right] \mathbb{P}\left[R_2 > 1\right] = 0.
\end{aligned}$$

Por lo tanto

$$\begin{aligned}
f_{R_1}(0) &= \mathbb{P}\left[R_2 = 0\right] \\
f_{R_1}(1) &= \sum_{n \geq 1}^{\infty} \mathbb{P}\left[R_2 = n\right] \\
f_{R_1}(j) &= 0, \text{ para } j > 1.
\end{aligned}$$

Política de k usuarios: Al igual que antes, para $y \in Z^+$ fijo

$$\mathbb{E}\left[R_1 | R_2 = y\right] = \sum_{x} x \mathbb{P}\left[R_1 = x | R_2 = y\right].$$

Entonces, si tomamos diversos valore para y:

$y = 0$:

$$\begin{aligned}
\mathbb{P}\left[R_1 = 0 | R_2 = 0\right] &= 1, \\
\mathbb{P}\left[R_1 = x | R_2 = 0\right] &= 0, \text{ para cualquier } x \geq 1,
\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=0\right]=0.$$

Para $y=1$,

$$\begin{aligned}\mathbb{P}\left[R_1=0|R_2=1\right] &= 0,\\ \mathbb{P}\left[R_1=1|R_2=1\right] &= 1,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=1\right]=1.$$

Para $y=2$,

$$\begin{aligned}\mathbb{P}\left[R_1=0|R_2=2\right] &= 0,\\ \mathbb{P}\left[R_1=1|R_2=2\right] &= 1,\\ \mathbb{P}\left[R_1=2|R_2=2\right] &= 1,\\ \mathbb{P}\left[R_1=3|R_2=2\right] &= 0,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=2\right]=3.$$

Para $y=3$,

$$\begin{aligned}\mathbb{P}\left[R_1=0|R_2=3\right] &= 0,\\ \mathbb{P}\left[R_1=1|R_2=3\right] &= 1,\\ \mathbb{P}\left[R_1=2|R_2=3\right] &= 1,\\ \mathbb{P}\left[R_1=3|R_2=3\right] &= 1,\\ \mathbb{P}\left[R_1=4|R_2=3\right] &= 0,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=3\right]=6.$$

En general, para $k\geq 0$,

$$\begin{aligned}\mathbb{P}\left[R_1=0|R_2=k\right] &= 0,\\ \mathbb{P}\left[R_1=j|R_2=k\right] &= 1,\ \text{para } 1\leq j\leq k,\\ \mathbb{P}\left[R_1=j|R_2=k\right] &= 0,\ \text{para } j>k,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=k\right]=\frac{k\left(k+1\right)}{2}.$$

Por lo tanto

$$\begin{aligned}\mathbb{E}\left[R_1\right] &= \sum_{y}\mathbb{E}\left[R_1|R_2=y\right]\mathbb{P}\left[R_2=y\right]\\ &= \sum_{y}\mathbb{P}\left[R_2=y\right]\frac{y\left(y+1\right)}{2}=\sum_{y\geq 1}\left(\frac{y\left(y+1\right)}{2}\right)\frac{\left(\lambda t\right)^{y}}{y!}e^{-\lambda t}\\ &= \frac{\lambda t}{2}e^{-\lambda t}\sum_{y\geq 1}\left(y+1\right)\frac{\left(\lambda t\right)^{y-1}}{\left(y-1\right)!}=\frac{\lambda t}{2}e^{-\lambda t}\left(e^{\lambda t}\left(\lambda t+2\right)\right)\\ &= \frac{\lambda t\left(\lambda t+2\right)}{2},\end{aligned}$$

es decir,

$$\mathbb{E}\left[R_1\right]=\frac{\lambda t\left(\lambda t+2\right)}{2}. \tag{36.61.9}$$

Además para $k\in Z^{+}$ fijo

$$\begin{aligned}f_{R_1}\left(k\right) &= \mathbb{P}\left[R_1=k\right]=\sum_{n=0}^{\infty}\mathbb{P}\left[R_1=k|R_2=n\right]\mathbb{P}\left[R_2=n\right]\\ &= \mathbb{P}\left[R_1=k|R_2=0\right]\mathbb{P}\left[R_2=0\right]+\mathbb{P}\left[R_1=k|R_2=1\right]\mathbb{P}\left[R_2=1\right]\\ &+ \mathbb{P}\left[R_1=k|R_2=2\right]\mathbb{P}\left[R_2=2\right]+\cdots+\mathbb{P}\left[R_1=k|R_2=j\right]\mathbb{P}\left[R_2=j\right]+\cdots+\end{aligned}$$

donde para

$k = 0$:

$$\begin{aligned}\mathbb{P}[R_1 = 0] = \mathbb{P}[R_1 = 0|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = 0|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = 0|R_2 = j]\,\mathbb{P}[R_2 = j] = \mathbb{P}[R_2 = 0].\end{aligned}$$

$k = 1$:

$$\begin{aligned}\mathbb{P}[R_1 = 1] = \mathbb{P}[R_1 = 1|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = 1|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = 1|R_2 = 1]\,\mathbb{P}[R_2 = 1] + \cdots + \mathbb{P}[R_1 = 1|R_2 = j]\,\mathbb{P}[R_2 = j] \\ = \sum_{n=1}^{\infty} \mathbb{P}[R_2 = n].\end{aligned}$$

$k = 2$:

$$\begin{aligned}\mathbb{P}[R_1 = 2] = \mathbb{P}[R_1 = 2|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = 2|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = 2|R_2 = 2]\,\mathbb{P}[R_2 = 2] + \cdots + \mathbb{P}[R_1 = 2|R_2 = j]\,\mathbb{P}[R_2 = j] \\ = \sum_{n=2}^{\infty} \mathbb{P}[R_2 = n].\end{aligned}$$

En general

$$\begin{aligned}\mathbb{P}[R_1 = k] = \mathbb{P}[R_1 = k|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = k|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = k|R_2 = 2]\,\mathbb{P}[R_2 = 2] + \cdots + \mathbb{P}[R_1 = k|R_2 = k]\,\mathbb{P}[R_2 = k] \\ = \sum_{n=k}^{\infty} \mathbb{P}[R_2 = n].\end{aligned}$$

Por lo tanto

$$f_{R_1}(k) \quad = \quad \mathbb{P}[R_1 = k] = \sum_{n=k}^{\infty} \mathbb{P}[R_2 = n].$$

Objetivos Principales

- Encontrar las ecuaciones que modelan el comportamiento de una Red de Sistemas de Visitas Cíclicas (RSVC) con propiedades similares.
- Encontrar expresiones analíticas para las longitudes de las colas al momento en que el servidor llega a una de ellas para comenzar a dar servicio, así como de sus segundos momentos.
- Determinar las principales medidas de Desempeño para la RSVC tales como: Número de usuarios presentes en cada una de las colas del sistema cuando uno de los servidores está presente atendiendo, Tiempos que transcurre entre las visitas del servidor a la misma cola.

36.62. Descripción de una Red de Sistemas de Visitas Cíclicas

Consideremos una red de sistema de visitas cíclicas conformada por dos sistemas de visitas cíclicas, cada una con dos colas independientes, donde además se permite el intercambio de usuarios entre los dos sistemas en la segunda cola de cada uno de ellos.

Supóngase además que los arribos de los usuarios ocurren conforme a un proceso Poisson con tasa de llegada μ_1 y μ_2 para el sistema 1, mientras que para el sistema 2, lo hacen conforme a un proceso Poisson con tasa $\hat{\mu}_1, \hat{\mu}_2$ respectivamente.

El traslado de un sistema a otro ocurre de manera que los tiempos entre llegadas de los usuarios a la cola dos del sistema 1 provenientes del sistema 2, se distribuye de manera exponencial con parámetro $\check{\mu}_2$.

Se considerarán intervalos de tiempo de la forma $[t, t+1]$. Los usuarios arriban por paquetes de manera independiente del resto de las colas. Se define el grupo de usuarios que llegan a cada una de las colas del sistema 1, caracterizadas por Q_1 y Q_2 respectivamente, en el intervalo de tiempo $[t, t+1]$ por $X_1(t), X_2(t)$. De igual manera se definen los procesos $\hat{X}_1(t), \hat{X}_2(t)$ para las colas del sistema 2, denotadas por $\hat{Q}_1$ y $\hat{Q}_2$ respectivamente.

Para el número de usuarios que se trasladan del sistema 2 al sistema 1, de la cola $\hat{Q}_2$ a la cola Q_2, en el intervalo de tiempo $[t, t+1]$, se define el proceso $Y_2(t)$.

El uso de la Función Generadora de Probabilidades (FGP's) nos permite determinar las Funciones de Distribución de Probabilidades Conjunta de manera indirecta sin necesidad de hacer uso de las propiedades de las distribuciones de probabilidad de cada uno de los procesos que intervienen en la Red de Sistemas de Visitas Cíclicas.

En lo que respecta al servidor, en términos de los tiempos de visita a cada una de las colas, se definen las variables aleatorias τ_1, τ_2 para Q_1, Q_2 respectivamente; y ζ_1, ζ_2 para $\hat{Q}_1, \hat{Q}_2$ del sistema 2. A los tiempos en que el servidor termina de atender en las colas $Q_1, Q_2, \hat{Q}_1, \hat{Q}_2$, se les denotará por $\overline{\tau}_1, \overline{\tau}_2, \overline{\zeta}_1, \overline{\zeta}_2$ respectivamente.

Los tiempos de traslado del servidor desde el momento en que termina de atender a una cola y llega a la siguiente para comenzar a dar servicio están dados por $\tau_2 - \overline{\tau}_1, \tau_1 - \overline{\tau}_2$ y $\zeta_2 - \overline{\zeta}_1, \zeta_1 - \overline{\zeta}_2$ para el sistema 1 y el sistema 2, respectivamente.

Cada uno de estos procesos con su respectiva FGP. Además, para cada una de las colas en cada sistema, el número de usuarios al tiempo en que llega el servidor a dar servicio está dado por el número de usuarios presentes en la cola al tiempo t, más el número de usuarios que llegan a la cola en el intervalo de tiempo $[\tau_i, \overline{\tau}_i]$.

Una vez definidas las Funciones Generadoras de Probabilidades Conjuntas se construyen las ecuaciones recursivas que permiten obtener la información sobre la longitud de cada una de las colas, al momento en que uno de los servidores llega a una de las colas para dar servicio, basándose en la información que se tiene sobre su llegada a la cola inmediata anterior.

36.62.1. Funciones Generadoras de Probabilidades

Para cada uno de los procesos de llegada a las colas $X_1, X_2, \hat{X}_1, \hat{X}_2$ y Y_2, con $\tilde{X}_2 = X_2 + Y_2$ anteriores se define su Función Generadora de Probabilidades (FGP):

$$\begin{aligned} P_1(z_1) &= \mathbb{E}\left[z_1^{X_1(t)}\right], & P_2(z_2) &= \mathbb{E}\left[z_2^{X_2(t)}\right], & \check{P}_2(z_2) &= \mathbb{E}\left[z_2^{Y_2(t)}\right], \\ \hat{P}_1(w_1) &= \mathbb{E}\left[w_1^{\hat{X}_1(t)}\right], & \hat{P}_2(w_2) &= \mathbb{E}\left[w_2^{\hat{X}_2(t)}\right], & \tilde{P}_2(z_2) &= \mathbb{E}\left[z_2^{\tilde{X}_2(t)}\right]. \end{aligned}$$

Con primer momento definidos por

$$\begin{aligned} \mu_1 &= \mathbb{E}[X_1(t)] = P_1^{(1)}(1), & \mu_2 &= \mathbb{E}[X_2(t)] = P_2^{(1)}(1), \\ \check{\mu}_2 &= \mathbb{E}[Y_2(t)] = \check{P}_2^{(1)}(1), & \hat{\mu}_1 &= \mathbb{E}\left[\hat{X}_1(t)\right] = \hat{P}_1^{(1)}(1), \\ \hat{\mu}_2 &= \mathbb{E}\left[\hat{X}_2(t)\right] = \hat{P}_2^{(1)}(1), & \tilde{\mu}_2 &= \mathbb{E}\left[\tilde{X}_2(t)\right] = \tilde{P}_2^{(1)}(1). \end{aligned}$$

En lo que respecta al servidor, en términos de los tiempos de visita a cada una de las colas, se denotarán por $B_1(t), B_2(t)$ los procesos correspondientes a las variables aleatorias τ_1, τ_2 para Q_1, Q_2 respectivamente; y $\hat{B}_1(t), \hat{B}_2(t)$ con parámetros ζ_1, ζ_2 para $\hat{Q}_1, \hat{Q}_2$ del sistema 2. Y a los tiempos en que el servidor termina de atender en las colas $Q_1, Q_2, \hat{Q}_1, \hat{Q}_2$, se les denotará por $\overline{\tau}_1, \overline{\tau}_2, \overline{\zeta}_1, \overline{\zeta}_2$ respectivamente. Entonces, los tiempos de servicio están dados por las diferencias $\overline{\tau}_1 - \tau_1, \overline{\tau}_2 - \tau_2$ para Q_1, Q_2, y $\overline{\zeta}_1 - \zeta_1, \overline{\zeta}_2 - \zeta_2$ para $\hat{Q}_1, \hat{Q}_2$ respectivamente.

Sus procesos se definen por:

$$\begin{aligned} S_1(z_1) &= \mathbb{E}\left[z_1^{\overline{\tau}_1 - \tau_1}\right], & S_2(z_2) &= \mathbb{E}\left[z_1^{\overline{\tau}_2 - \tau_2}\right], \\ \hat{S}_1(w_1) &= \mathbb{E}\left[w_1^{\overline{\zeta}_1 - \zeta_1}\right], & \hat{S}_2(w_2) &= \mathbb{E}\left[w_2^{\overline{\zeta}_2 - \zeta_2}\right], \end{aligned}$$

con primer momento dado por:

$$s_1 = \mathbb{E}[\overline{\tau}_1 - \tau_1], \quad s_2 = \mathbb{E}[\overline{\tau}_2 - \tau_2], \quad \hat{s}_1 = \mathbb{E}\left[\overline{\zeta}_1 - \zeta_1\right], \quad \hat{s}_2 = \mathbb{E}\left[\overline{\zeta}_2 - \zeta_2\right].$$

Análogamente los tiempos de traslado del servidor desde el momento en que termina de atender a una cola y llega a la siguiente para comenzar a dar servicio están dados por $\tau_2 - \overline{\tau}_1, \tau_1 - \overline{\tau}_2$ y $\zeta_2 - \overline{\zeta}_1, \zeta_1 - \overline{\zeta}_2$ para el sistema 1 y el sistema 2, respectivamente.

La FGP para estos tiempos de traslado están dados por

$$\begin{aligned} R_1(z_1) &= \mathbb{E}\left[z_1^{\tau_2 - \overline{\tau}_1}\right], & R_2(z_2) &= \mathbb{E}\left[z_2^{\tau_1 - \overline{\tau}_2}\right], \\ \hat{R}_1(w_1) &= \mathbb{E}\left[w_1^{\zeta_2 - \overline{\zeta}_1}\right], & \hat{R}_2(w_2) &= \mathbb{E}\left[w_2^{\zeta_1 - \overline{\zeta}_2}\right], \end{aligned}$$

y al igual que como se hizo con anterioridad

$$r_1 = R_1^{(1)}(1) = \mathbb{E}\left[\tau_2 - \overline{\tau}_1\right], \quad r_2 = R_2^{(1)}(1) = \mathbb{E}\left[\tau_1 - \overline{\tau}_2\right],$$
$$\hat{r}_1 = \hat{R}_1^{(1)}(1) = \mathbb{E}\left[\zeta_2 - \overline{\zeta}_1\right], \quad \hat{r}_2 = \hat{R}_2^{(1)}(1) = \mathbb{E}\left[\zeta_1 - \overline{\zeta}_2\right].$$

Se definen los procesos de conteo para el número de usuarios en cada una de las colas al tiempo t, $L_1(t), L_2(t)$, para $H_1(t), H_2(t)$ del sistema 1, respectivamente. Y para el segundo sistema, se tienen los procesos $\hat{L}_1(t), \hat{L}_2(t)$ para $\hat{H}_1(t), \hat{H}_2(t)$, respectivamente, es decir,

$$H_1(t) = \mathbb{E}\left[z_1^{L_1(t)}\right], \quad H_2(t) = \mathbb{E}\left[z_2^{L_2(t)}\right], \quad \hat{H}_1(t) = \mathbb{E}\left[w_1^{\hat{L}_1(t)}\right], \quad \hat{H}_2(t) = \mathbb{E}\left[w_2^{\hat{L}_2(t)}\right].$$

Por lo dicho anteriormente se tiene que el número de usuarios presentes en los tiempos $\overline{\tau}_1, \overline{\tau}_2, \overline{\zeta}_1, \overline{\zeta}_2$, es cero, es decir, $L_i(\overline{\tau_i}) = 0$, y $\hat{L}_i\left(\overline{\zeta_i}\right) = 0$ para i=1,2 para cada uno de los dos sistemas.

Para cada una de las colas en cada sistema, el número de usuarios al tiempo en que llega el servidor a dar servicio está dado por el número de usuarios presentes en la cola al tiempo $t = \tau_i, \zeta_i$, más el número de usuarios que llegan a la cola en el intervalo de tiempo $[\tau_i, \overline{\tau}_i], \left[\zeta_i, \overline{\zeta}_i\right]$, es decir

$$L_1(\overline{\tau}_1) = L_1(\tau_1) + X_1(\overline{\tau}_1 - \tau_1), \quad \hat{L}_1(\overline{\tau}_1) = \hat{L}_1(\tau_1) + \hat{X}_1(\overline{\tau}_1 - \tau_1),$$
$$\hat{L}_2(\overline{\tau}_1) = \hat{L}_2(\tau_1) + \hat{X}_2(\overline{\tau}_1 - \tau_1).$$

En el caso específico de Q_2, además, hay que considerar el número de usuarios que pasan del sistema 2 al sistema 1, a traves de $\hat{Q}_2$ mientras el servidor en Q_2 está ausente, es decir:

$$L_2(\overline{\tau}_1) = L_2(\tau_1) + X_2(\overline{\tau}_1 - \tau_1) + Y_2(\overline{\tau}_1 - \tau_1). \tag{36.62.1}$$

36.62.2. El problema de la ruina del jugador

Supongamos que se tiene un jugador que cuenta con un capital inicial de $\tilde{L}_0 \geq 0$ unidades, esta persona realiza una serie de dos juegos simultáneos e independientes de manera sucesiva, dichos eventos son independientes e idénticos entre sí para cada realización.

La ganancia en el n-ésimo juego es

$$\tilde{X}_n = X_n + Y_n$$

unidades de las cuales se resta una cuota de 1 unidad por cada juego simultáneo, es decir, se restan dos unidades por cada juego realizado.

En términos de la teoría de colas puede pensarse como el número de usuarios que llegan a una cola vía dos procesos de arribo distintos e independientes entre sí.

Su Función Generadora de Probabilidades (FGP) está dada por

$$F(z) = \mathbb{E}\left[z^{\tilde{L}_0}\right]$$

$$\tilde{P}(z) = \mathbb{E}\left[z^{\tilde{X}_n}\right] = \mathbb{E}\left[z^{X_n + Y_n}\right] = \mathbb{E}\left[z^{X_n} z^{Y_n}\right] = \mathbb{E}\left[z^{X_n}\right]\mathbb{E}\left[z^{Y_n}\right] = P(z)\check{P}(z),$$

entonces

$$\tilde{\mu} \quad = \quad \mathbb{E}\left[\tilde{X}_n\right] = \tilde{P}[z] < 1.$$

Sea $\tilde{L}_n$ el capital remanente después del n-ésimo juego. Entonces

$$\tilde{L}_n \quad = \quad \tilde{L}_0 + \tilde{X}_1 + \tilde{X}_2 + \cdots + \tilde{X}_n - 2n.$$

La ruina del jugador ocurre después del n-ésimo juego, es decir, la cola se vacía después del n-ésimo juego, entonces sea T definida como

$$T \quad = \quad min\left\{\tilde{L}_n = 0\right\}$$

Si $\tilde{L}_0 = 0$, entonces claramente $T = 0$. En este sentido T puede interpretarse como la longitud del periodo de tiempo que el servidor ocupa para dar servicio en la cola, comenzando con $\tilde{L}_0$ grupos de usuarios presentes en la cola, quienes arribaron conforme a un proceso dado por $\tilde{P}(z)$.

Sea $g_{n,k}$ la probabilidad del evento de que el jugador no caiga en ruina antes del n-ésimo juego, y que además tenga un capital de k unidades antes del n-ésimo juego, es decir,

Dada $n \in \{1, 2, \ldots, \}$ y $k \in \{0, 1, 2, \ldots, \}$

$$g_{n,k} := P\left\{\tilde{L}_j > 0, j = 1, \ldots, n, \tilde{L}_n = k\right\}$$

la cual además se puede escribir como:

$$\begin{aligned}
g_{n,k} &= P\left\{\tilde{L}_j > 0, j = 1, \ldots, n, \tilde{L}_n = k\right\} = \sum_{j=1}^{k+1} g_{n-1,j} P\left\{\tilde{X}_n = k - j + 1\right\} \\
&= \sum_{j=1}^{k+1} g_{n-1,j} P\left\{X_n + Y_n = k - j + 1\right\} = \sum_{j=1}^{k+1} \sum_{l=1}^{j} g_{n-1,j} P\left\{X_n + Y_n = k - j + 1, Y_n = l\right\} \\
&= \sum_{j=1}^{k+1} \sum_{l=1}^{j} g_{n-1,j} P\left\{X_n + Y_n = k - j + 1 | Y_n = l\right\} P\left\{Y_n = l\right\} \\
&= \sum_{j=1}^{k+1} \sum_{l=1}^{j} g_{n-1,j} P\left\{X_n = k - j - l + 1\right\} P\left\{Y_n = l\right\}
\end{aligned}$$

es decir

$$g_{n,k} = \sum_{j=1}^{k+1} \sum_{l=1}^{j} g_{n-1,j} P\left\{X_n = k - j - l + 1\right\} P\left\{Y_n = l\right\} \tag{36.62.2}$$

además

$$g_{0,k} = P\left\{\tilde{L}_0 = k\right\}. \tag{36.62.3}$$

Se definen las siguientes FGP:

$$G_n(z) = \sum_{k=0}^{\infty} g_{n,k} z^k, \text{ para } n = 0, 1, \ldots, \tag{36.62.4}$$

$$G(z, w) = \sum_{n=0}^{\infty} G_n(z) w^n. \tag{36.62.5}$$

En particular para $k = 0$,

$$g_{n,0} = G_n(0) = P\left\{\tilde{L}_j > 0, \text{ para } j < n, \text{ y } \tilde{L}_n = 0\right\} = P\left\{T = n\right\},$$

además

$$G(0, w) = \sum_{n=0}^{\infty} G_n(0) w^n = \sum_{n=0}^{\infty} P\left\{T = n\right\} w^n = \mathbb{E}\left[w^T\right]$$

la cuál resulta ser la FGP del tiempo de ruina T.

Proposición 36.62.1 *Sean $G_n(z)$ y $G(z, w)$ definidas como en (36.81.4) y (36.81.5) respectivamente, entonces*

$$G_n(z) = \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right] \tilde{P}(z). \tag{36.62.6}$$

Además

$$G(z, w) = \frac{zF(z) - wP(z) G(0, w)}{z - wR(z)}, \tag{36.62.7}$$

con un único polo en el círculo unitario, además, el polo es de la forma $z = \theta(w)$ y satisface que

i) $\tilde{\theta}(1) = 1$,

ii) $\tilde{\theta}^{(1)}(1) = \frac{1}{1-\tilde{\mu}}$,

iii) $\tilde{\theta}^{(2)}(1) = \frac{\tilde{\mu}}{(1-\tilde{\mu})^2} + \frac{\tilde{\sigma}}{(1-\tilde{\mu})^3}$.

Finalmente, además se cumple que

$$\mathbb{E}\left[w^T\right] = G(0,w) = F\left[\tilde{\theta}(w)\right]. \tag{36.62.8}$$

Multiplicando las ecuaciones (36.81.2) y (36.81.3) por el término z^k:

$$\begin{aligned} g_{n,k}z^k &= \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}P\{X_n = k-j-l+1\}P\{Y_n = l\}z^k, \\ g_{0,k}z^k &= P\left\{\tilde{L}_0 = k\right\}z^k, \end{aligned}$$

ahora sumamos sobre k

$$\begin{aligned} \sum_{k=0}^{\infty} g_{n,k}z^k &= \sum_{k=0}^{\infty}\sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}P\{X_n = k-j-l+1\}P\{Y_n = l\}z^k \\ &= \sum_{k=0}^{\infty} z^k \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}P\{X_n = k-(j+l-1)\}P\{Y_n = l\} \\ &= \sum_{k=0}^{\infty} z^{k+(j+l-1)-(j+l-1)} \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}P\{X_n = k-(j+l-1)\}P\{Y_n = l\} \\ &= \sum_{k=0}^{\infty}\sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}z^{j-1}P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}P\{Y_n = l\}z^l \\ &= \sum_{j=1}^{\infty}\sum_{l=1}^{j} g_{n-1,j}z^{j-1}\sum_{k=j+l-1}^{\infty} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}P\{Y_n = l\}z^l \\ &= \sum_{j=1}^{\infty} g_{n-1,j}z^{j-1}\sum_{l=1}^{j}\sum_{k=j+l-1}^{\infty} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}P\{Y_n = l\}z^l \\ &= \sum_{j=1}^{\infty} g_{n-1,j}z^{j-1}\sum_{k=j+l-1}^{\infty}\sum_{l=1}^{j} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}P\{Y_n = l\}z^l \end{aligned}$$

luego

$$\begin{aligned} &= \sum_{j=1}^{\infty} g_{n-1,j}z^{j-1}\sum_{k=j+l-1}^{\infty}\sum_{l=1}^{j} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}\sum_{l=1}^{j} P\{Y_n = l\}z^l \\ &= \sum_{j=1}^{\infty} g_{n-1,j}z^{j-1}\sum_{l=1}^{\infty} P\{Y_n = l\}z^l \sum_{k=j+l-1}^{\infty}\sum_{l=1}^{j} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)} \\ &= \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z)\sum_{k=j+l-1}^{\infty}\sum_{l=1}^{j} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)} \\ &= \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z)P(z) = \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z), \end{aligned}$$

es decir la ecuación (36.81.4) se puede reescribir como

$$G_n(z) = \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z). \tag{36.62.9}$$

Por otra parte recordemos la ecuación (36.81.4)

$$G_n(z) = \sum_{k=0}^{\infty} g_{n,k}z^k, \text{ entonces } \frac{G_n(z)}{z} = \sum_{k=1}^{\infty} g_{n,k}z^{k-1},$$

Por lo tanto utilizando la ecuación (36.81.9):

$$\begin{aligned} G(z,w) &= \sum_{n=0}^{\infty} G_n(z)\, w^n = G_0(z) + \sum_{n=1}^{\infty} G_n(z)\, w^n = F(z) + \sum_{n=0}^{\infty} \left[G_n(z) - G_n(0)\right] w^n \frac{\tilde{P}(z)}{z} \\ &= F(z) + \frac{w}{z} \sum_{n=0}^{\infty} \left[G_n(z) - G_n(0)\right] w^{n-1} \tilde{P}(z) \end{aligned}$$

es decir

$$G(z,w) = F(z) + \frac{w}{z}\left[G(z,w) - G(0,w)\right]\tilde{P}(z),$$

entonces

$$\begin{aligned} G(z,w) = F(z) + \frac{w}{z}\left[G(z,w) - G(0,w)\right]\tilde{P}(z) &= F(z) + \frac{w}{z}\tilde{P}(z)\, G(z,w) - \frac{w}{z}\tilde{P}(z)\, G(0,w) \\ &\Leftrightarrow \\ G(z,w)\left\{1 - \frac{w}{z}\tilde{P}(z)\right\} &= F(z) - \frac{w}{z}\tilde{P}(z)\, G(0,w), \end{aligned}$$

por lo tanto,

$$G(z,w) = \frac{zF(z) - w\tilde{P}(z)\, G(0,w)}{1 - w\tilde{P}(z)}. \tag{36.62.10}$$

Ahora $G(z,w)$ es analítica en $|z| = 1$. Sean z, w tales que $|z| = 1$ y $|w| \leq 1$, como $\tilde{P}(z)$ es FGP

$$|z - \left(z - w\tilde{P}(z)\right)| < |z| \Leftrightarrow |w\tilde{P}(z)| < |z|$$

es decir, se cumplen las condiciones del Teorema de Rouché y por tanto, z y $z - w\tilde{P}(z)$ tienen el mismo número de ceros en $|z| = 1$. Sea $z = \tilde{\theta}(w)$ la solución única de $z - w\tilde{P}(z)$, es decir

$$\tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right) = 0, \tag{36.62.11}$$

con $|\tilde{\theta}(w)| < 1$. Cabe hacer mención que $\tilde{\theta}(w)$ es la FGP para el tiempo de ruina cuando $\tilde{L}_0 = 1$.
Considerando la ecuación (36.81.11)

$$\begin{aligned} &\frac{\partial}{\partial w}\tilde{\theta}(w)|_{w=1} - \frac{\partial}{\partial w}\left\{w\tilde{P}\left(\tilde{\theta}(w)\right)\right\}|_{w=1} = 0 \\ &\tilde{\theta}^{(1)}(w)|_{w=1} - \frac{\partial}{\partial w} w\left\{\tilde{P}\left(\tilde{\theta}(w)\right)\right\}|_{w=1} - w\frac{\partial}{\partial w}\tilde{P}\left(\tilde{\theta}(w)\right)|_{w=1} = 0 \\ &\tilde{\theta}^{(1)}(1) - \tilde{P}\left(\tilde{\theta}(1)\right) - w\left\{\frac{\partial\tilde{P}\left(\tilde{\theta}(w)\right)}{\partial\tilde{\theta}(w)} \cdot \frac{\partial\tilde{\theta}(w)}{\partial w}|_{w=1}\right\} = 0 \\ &\tilde{\theta}^{(1)}(1) - \tilde{P}\left(\tilde{\theta}(1)\right) - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right) \cdot \tilde{\theta}^{(1)}(1) = 0 \end{aligned}$$

luego

$$\begin{aligned} &\tilde{\theta}^{(1)}(1) - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right) \cdot \tilde{\theta}^{(1)}(1) = \tilde{P}\left(\tilde{\theta}(1)\right) \\ &\tilde{\theta}^{(1)}(1)\left(1 - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)\right) = \tilde{P}\left(\tilde{\theta}(1)\right) \\ &\tilde{\theta}^{(1)}(1) = \frac{\tilde{P}\left(\tilde{\theta}(1)\right)}{\left(1 - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)\right)} = \frac{1}{1 - \tilde{\mu}}. \end{aligned}$$

Ahora determinemos el segundo momento de $\tilde{\theta}(w)$, nuevamente consideremos la ecuación (36.81.11):

$$\begin{aligned} &\tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right) = 0 \\ &\frac{\partial}{\partial w}\left\{\tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right)\right\} = 0 \\ &\frac{\partial}{\partial w}\left\{\frac{\partial}{\partial w}\left\{\tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right)\right\}\right\} = 0 \end{aligned}$$

luego

$$\begin{aligned}
\frac{\partial}{\partial w}\left\{\frac{\partial}{\partial w}\tilde{\theta}(w)-\frac{\partial}{\partial w}\left[w\tilde{P}\left(\tilde{\theta}(w)\right)\right]\right\} &= \frac{\partial}{\partial w}\left\{\frac{\partial}{\partial w}\tilde{\theta}(w)-\frac{\partial}{\partial w}\left[w\tilde{P}\left(\tilde{\theta}(w)\right)\right]\right\} \\
&= \frac{\partial}{\partial w}\left\{\frac{\partial\tilde{\theta}(w)}{\partial w}-\left[\tilde{P}\left(\tilde{\theta}(w)\right)+w\frac{\partial}{\partial w}R\left(\tilde{\theta}(w)\right)\right]\right\} \\
&= \frac{\partial}{\partial w}\left\{\frac{\partial\tilde{\theta}(w)}{\partial w}-\left[\tilde{P}\left(\tilde{\theta}(w)\right)+w\frac{\partial\tilde{P}\left(\tilde{\theta}(w)\right)}{\partial w}\frac{\partial\tilde{\theta}(w)}{\partial w}\right]\right\} \\
&= \frac{\partial}{\partial w}\left\{\tilde{\theta}^{(1)}(w)-\tilde{P}\left(\tilde{\theta}(w)\right)-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)\right\} \\
&= \frac{\partial}{\partial w}\tilde{\theta}^{(1)}(w)-\frac{\partial}{\partial w}\tilde{P}\left(\tilde{\theta}(w)\right)-\frac{\partial}{\partial w}\left[w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)\right]
\end{aligned}$$

$$\begin{aligned}
&= \frac{\partial}{\partial w}\tilde{\theta}^{(1)}(w)-\frac{\partial\tilde{P}\left(\tilde{\theta}(w)\right)}{\partial\tilde{\theta}(w)}\frac{\partial\tilde{\theta}(w)}{\partial w}-\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w) \\
&- w\frac{\partial\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}{\partial w}\tilde{\theta}^{(1)}(w)-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\frac{\partial\tilde{\theta}^{(1)}(w)}{\partial w} \\
&= \tilde{\theta}^{(2)}(w)-\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)-\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w) \\
&- w\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)\left(\tilde{\theta}^{(1)}(w)\right)^2-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(2)}(w) \\
&= \tilde{\theta}^{(2)}(w)-2\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w) \\
&- w\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)\left(\tilde{\theta}^{(1)}(w)\right)^2-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(2)}(w) \\
&= \tilde{\theta}^{(2)}(w)\left[1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right]-\tilde{\theta}^{(1)}(w)\left[w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)+2\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right]
\end{aligned}$$

luego

$$\begin{aligned}
\tilde{\theta}^{(2)}(w)\left[1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right] &- \tilde{\theta}^{(1)}(w)\left[w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)+2\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right]=0 \\
\tilde{\theta}^{(2)}(w) &= \frac{\tilde{\theta}^{(1)}(w)\left[w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)+2R^{(1)}\left(\tilde{\theta}(w)\right)\right]}{1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)} \\
\tilde{\theta}^{(2)}(w) &= \frac{\tilde{\theta}^{(1)}(w)\,w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)}{1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}+\frac{2\tilde{\theta}^{(1)}(w)\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}{1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}
\end{aligned}$$

si evaluamos la expresión anterior en $w=1$:

$$\begin{aligned}
\tilde{\theta}^{(2)}(1) &= \frac{\left(\tilde{\theta}^{(1)}(1)\right)^2\tilde{P}^{(2)}\left(\tilde{\theta}(1)\right)}{1-\tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)}+\frac{2\tilde{\theta}^{(1)}(1)\tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)}{1-\tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)}=\frac{\left(\tilde{\theta}^{(1)}(1)\right)^2\tilde{P}^{(2)}(1)}{1-\tilde{P}^{(1)}(1)}+\frac{2\tilde{\theta}^{(1)}(1)\tilde{P}^{(1)}(1)}{1-\tilde{P}^{(1)}(1)} \\
&= \frac{\left(\frac{1}{1-\tilde{\mu}}\right)^2\tilde{P}^{(2)}(1)}{1-\tilde{\mu}}+\frac{2\left(\frac{1}{1-\tilde{\mu}}\right)\tilde{\mu}}{1-\tilde{\mu}}=\frac{\tilde{P}^{(2)}(1)}{(1-\tilde{\mu})^3}+\frac{2\tilde{\mu}}{(1-\tilde{\mu})^2}=\frac{\sigma^2-\tilde{\mu}+\tilde{\mu}^2}{(1-\tilde{\mu})^3}+\frac{2\tilde{\mu}}{(1-\tilde{\mu})^2} \\
&= \frac{\sigma^2-\tilde{\mu}+\tilde{\mu}^2+2\tilde{\mu}(1-\tilde{\mu})}{(1-\tilde{\mu})^3}
\end{aligned}$$

es decir

$$\tilde{\theta}^{(2)}(1) = \frac{\sigma^2+\tilde{\mu}-\tilde{\mu}^2}{(1-\tilde{\mu})^3}=\frac{\sigma^2}{(1-\tilde{\mu})^3}+\frac{\tilde{\mu}(1-\tilde{\mu})}{(1-\tilde{\mu})^3}=\frac{\sigma^2}{(1-\tilde{\mu})^3}+\frac{\tilde{\mu}}{(1-\tilde{\mu})^2}.$$

Corolario 36.62.1 *El tiempo de ruina del jugador tiene primer y segundo momento dados por*

$$\mathbb{E}[T] = \frac{\mathbb{E}\left[\tilde{L}_0\right]}{1-\tilde{\mu}} \tag{36.62.12}$$

$$Var[T] = \frac{Var\left[\tilde{L}_0\right]}{(1-\tilde{\mu})^2}+\frac{\sigma^2\mathbb{E}\left[\tilde{L}_0\right]}{(1-\tilde{\mu})^3}. \tag{36.62.13}$$

36.63. Procesos de Llegadas a las colas en la RSVC

Se definen los procesos de llegada de los usuarios a cada una de las colas dependiendo de la llegada del servidor pero del sistema al cuál no pertenece la cola en cuestión:

Para el sistema 1 y el servidor del segundo sistema

$$F_{i,j}\left(z_i;\zeta_j\right)=\mathbb{E}\left[z_i^{L_i(\zeta_j)}\right]=\sum_{k=0}^{\infty}\mathbb{P}\left[L_i\left(\zeta_j\right)=k\right]z_i^k,\text{ para } i,j=1,2.$$

Ahora se definen para el segundo sistema y el servidor del primero

$$\hat{F}_{i,j}\left(w_i;\tau_j\right) = \mathbb{E}\left[w_i^{\hat{L}_i(\tau_j)}\right]=\sum_{k=0}^{\infty}\mathbb{P}\left[\hat{L}_i\left(\tau_j\right)=k\right]w_i^k,\text{ para } i,j=1,2.$$

Ahora, con lo anterior definamos la FGP conjunta para el segundo sistema;

$$\mathbb{E}\left[w_1^{\hat{L}_1(\tau_j)}w_2^{\hat{L}_2(\tau_j)}\right] = \mathbb{E}\left[w_1^{\hat{L}_1(\tau_j)}\right]\mathbb{E}\left[w_2^{\hat{L}_2(\tau_j)}\right]=\hat{F}_{1,j}\left(w_1;\tau_j\right)\hat{F}_{2,j}\left(w_2;\tau_j\right)=\hat{F}_j\left(w_1,w_2;\tau_j\right).$$

Con respecto al sistema 1 se tiene la FGP conjunta con respecto al servidor del otro sistema:

$$\mathbb{E}\left[z_1^{L_1(\zeta_j)}z_2^{L_2(\zeta_j)}\right] = \mathbb{E}\left[z_1^{L_1(\zeta_j)}\right]\mathbb{E}\left[z_2^{L_2(\zeta_j)}\right]=F_{1,j}\left(z_1;\zeta_j\right)F_{2,j}\left(z_2;\zeta_j\right)=F_j\left(z_1,z_2;\zeta_j\right).$$

Ahora analicemos la Red de Sistemas de Visitas Cíclicas, entonces se define la PGF conjunta al tiempo t para los tiempos de visita del servidor en cada una de las colas, para comenzar a dar servicio, definidos anteriormente al tiempo $t=\{\tau_1,\tau_2,\zeta_1,\zeta_2\}$:

$$F_j\left(z_1,z_2,w_1,w_2\right) = \mathbb{E}\left[\prod_{i=1}^{2}z_i^{L_i(\tau_j)}\prod_{i=1}^{2}w_i^{\hat{L}_i(\tau_j)}\right] \tag{36.63.1}$$

$$\hat{F}_j\left(z_1,z_2,w_1,w_2\right) = \mathbb{E}\left[\prod_{i=1}^{2}z_i^{L_i(\zeta_j)}\prod_{i=1}^{2}w_i^{\hat{L}_i(\zeta_j)}\right] \tag{36.63.2}$$

para $j=1,2$. Entonces, con la finalidad de encontrar el número de usuarios presentes en el sistema cuando el servidor deja de atender una de las colas de cualquier sistema se tiene lo siguiente

$$\begin{aligned}&\mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)}z_2^{L_2(\overline{\tau}_1)}w_1^{\hat{L}_1(\overline{\tau}_1)}w_2^{\hat{L}_2(\overline{\tau}_1)}\right]=\mathbb{E}\left[z_2^{L_2(\overline{\tau}_1)}w_1^{\hat{L}_1(\overline{\tau}_1)}w_2^{\hat{L}_2(\overline{\tau}_1)}\right]\\ =\ &\mathbb{E}\left[z_2^{L_2(\tau_1)+X_2(\overline{\tau}_1-\tau_1)+Y_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{L}_1(\tau_1)+\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{L}_2(\tau_1)+\hat{X}_2(\overline{\tau}_1-\tau_1)}\right]\end{aligned}$$

utilizando la ecuacion dada (36.82.1), luego

$$\begin{aligned}=\ &\mathbb{E}\left[z_2^{L_2(\tau_1)}z_2^{X_2(\overline{\tau}_1-\tau_1)}z_2^{Y_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{L}_1(\tau_1)}w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{L}_2(\tau_1)}w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right]\\ =\ &\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right\}\left\{z_2^{X_2(\overline{\tau}_1-\tau_1)}z_2^{Y_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right]\end{aligned}$$

Aplicando la ecuación (36.81.1)

$$=\ \mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{z_2^{X_2(\overline{\tau}_1-\tau_1)}z_2^{Y_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]$$

dado que los arribos a cada una de las colas son independientes, podemos separar la esperanza para los procesos de llegada a Q_1 y Q_2 en τ_1

Recordando que $\tilde{X}_2\left(z_2\right)=X_2\left(z_2\right)+Y_2\left(z_2\right)$ se tiene

$$\begin{aligned}=\ &\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{z_2^{\tilde{X}_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]\\ =\ &\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{\tilde{P}_2\left(z_2\right)^{\overline{\tau}_1-\tau_1}\hat{P}_1\left(w_1\right)^{\overline{\tau}_1-\tau_1}\hat{P}_2\left(w_2\right)^{\overline{\tau}_1-\tau_1}\right\}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]\\ =\ &\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right\}^{\overline{\tau}_1-\tau_1}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]\end{aligned}$$

Entonces

$$
\begin{aligned}
&= \mathbb{E}\left[z_2^{L_2(\tau_1)}\theta_1\left(\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right)^{L_1(\tau_1)}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]\\
&= F_1\left(\theta_1\left(\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),z2\right)\hat{F}_1\left(w_1,w_2;\tau_1\right)\\
&\equiv F_1\left(\theta_1\left(\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),z_2,w_1,w_2\right)
\end{aligned}
$$

Las igualdades anteriores son ciertas pues el número de usuarios que llegan a $\hat{Q}_2$ durante el intervalo $[\tau_1,\overline{\tau}_1]$ aún no han sido atendidos por el servidor del sistema 2 y por tanto aún no pueden pasar al sistema 1 por Q_2. Por tanto el número de usuarios que pasan de $\hat{Q}_2$ a Q_2 en el intervalo de tiempo $[\tau_1,\overline{\tau}_1]$ depende de la política de traslado entre los dos sistemas, conforme a la sección anterior.

Por lo tanto

$$
\begin{aligned}
\mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)}z_2^{L_2(\overline{\tau}_1)}w_1^{\hat{L}_1(\overline{\tau}_1)}w_2^{\hat{L}_2(\overline{\tau}_1)}\right] &= F_1\left(\theta_1\left(\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),z_2,w_1,w_2\right) && (36.63.3)\\
&= F_1\left(\theta_1\left(\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),z2\right)\hat{F}_1\left(w_1,w_2;\tau_1\right) && (36.63.4)
\end{aligned}
$$

Utilizando un razonamiento análogo para $\overline{\tau}_2$:

$$
\begin{aligned}
&\mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)}z_2^{L_2(\overline{\tau}_2)}w_1^{\hat{L}_1(\overline{\tau}_2)}w_2^{\hat{L}_2(\overline{\tau}_2)}\right]=\mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)}w_1^{\hat{L}_1(\overline{\tau}_2)}w_2^{\hat{L}_2(\overline{\tau}_2)}\right]\\
=\ &\mathbb{E}\left[z_1^{L_1(\tau_2)+X_1(\overline{\tau}_2-\tau_2)}w_1^{\hat{L}_1(\tau_2)+\hat{X}_1(\overline{\tau}_2-\tau_2)}w_2^{\hat{L}_2(\tau_2)+\hat{X}_2(\overline{\tau}_2-\tau_2)}\right]\\
=\ &\mathbb{E}\left[z_1^{L_1(\tau_2)}z_1^{X_1(\overline{\tau}_2-\tau_2)}w_1^{\hat{L}_1(\tau_2)}w_1^{\hat{X}_1(\overline{\tau}_2-\tau_2)}w_2^{\hat{L}_2(\tau_2)}w_2^{\hat{X}_2(\overline{\tau}_2-\tau_2)}\right]\\
=\ &\mathbb{E}\left[z_1^{L_1(\tau_2)}z_1^{X_1(\overline{\tau}_2-\tau_2)}w_1^{\hat{X}_1(\overline{\tau}_2-\tau_2)}w_2^{\hat{X}_2(\overline{\tau}_2-\tau_2)}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)}w_2^{\hat{L}_2(\tau_2)}\right]\\
=\ &\mathbb{E}\left[z_1^{L_1(\tau_2)}P_1\left(z_1\right)^{\overline{\tau}_2-\tau_2}\hat{P}_1\left(w_1\right)^{\overline{\tau}_2-\tau_2}\hat{P}_2\left(w_2\right)^{\overline{\tau}_2-\tau_2}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)}w_2^{\hat{L}_2(\tau_2)}\right]
\end{aligned}
$$

utlizando la proposición relacionada con la ruina del jugador

$$
\begin{aligned}
&= \mathbb{E}\left[z_1^{L_1(\tau_2)}\left\{P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right\}^{\overline{\tau}_2-\tau_2}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)}w_2^{\hat{L}_2(\tau_2)}\right]\\
&= \mathbb{E}\left[z_1^{L_1(\tau_2)}\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right)^{L_2(\tau_2)}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)}w_2^{\hat{L}_2(\tau_2)}\right]\\
&= F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right)\right)\hat{F}_2\left(w_1,w_2;\tau_2\right)
\end{aligned}
$$

entonces se define

$$
\begin{aligned}
\mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)}z_2^{L_2(\overline{\tau}_2)}w_1^{\hat{L}_1(\overline{\tau}_2)}w_2^{\hat{L}_2(\overline{\tau}_2)}\right] &= F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right) && (36.63.5)\\
&\equiv F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right)\right)\hat{F}_2\left(w_1,w_2;\tau_2\right) && (36.63.6)
\end{aligned}
$$

Ahora para $\overline{\zeta}_1$:

$$
\begin{aligned}
&\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)}z_2^{L_2(\overline{\zeta}_1)}w_1^{\hat{L}_1(\overline{\zeta}_1)}w_2^{\hat{L}_2(\overline{\zeta}_1)}\right]=\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)}z_2^{L_2(\overline{\zeta}_1)}w_2^{\hat{L}_2(\overline{\zeta}_1)}\right]\\
=\ &\mathbb{E}\left[z_1^{L_1(\zeta_1)}z_1^{X_1(\overline{\zeta}_1-\zeta_1)}z_2^{L_2(\zeta_1)}z_2^{X_2(\overline{\zeta}_1-\zeta_1)}z_2^{Y_2(\overline{\zeta}_1-\zeta_1)}w_2^{\hat{L}_2(\zeta_1)}w_2^{\hat{X}_2(\overline{\zeta}_1-\zeta_1)}\right]\\
=\ &\mathbb{E}\left[z_1^{L_1(\zeta_1)}z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[z_1^{X_1(\overline{\zeta}_1-\zeta_1)}z_2^{\hat{X}_2(\overline{\zeta}_1-\zeta_1)}w_2^{\hat{X}_2(\overline{\zeta}_1-\zeta_1)}w_2^{\hat{L}_2(\zeta_1)}\right]\\
=\ &\mathbb{E}\left[z_1^{L_1(\zeta_1)}z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[P_1\left(z_1\right)^{\overline{\zeta}_1-\zeta_1}\tilde{P}_2\left(z_2\right)^{\overline{\zeta}_1-\zeta_1}\hat{P}_2\left(w_2\right)^{\overline{\zeta}_1-\zeta_1}w_2^{\hat{L}_2(\zeta_1)}\right]\\
=\ &\mathbb{E}\left[z_1^{L_1(\zeta_1)}z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[\left\{P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right\}^{\overline{\zeta}_1-\zeta_1}w_2^{\hat{L}_2(\zeta_1)}\right]\\
=\ &\mathbb{E}\left[z_1^{L_1(\zeta_1)}z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right)^{\hat{L}_1(\zeta_1)}w_2^{\hat{L}_2(\zeta_1)}\right]\\
=\ &F_1\left(z_1,z_2;\zeta_1\right)\hat{F}_1\left(\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)
\end{aligned}
$$

es decir

$$
\begin{aligned}
\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)}z_2^{L_2(\overline{\zeta}_1)}w_1^{\hat{L}_1(\overline{\zeta}_1)}w_2^{\hat{L}_2(\overline{\zeta}_1)}\right] &= \hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right) && (36.63.7)\\
&= F_1\left(z_1,z_2;\zeta_1\right)\hat{F}_1\left(\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right). && (36.63.8)
\end{aligned}
$$

Finalmente para $\overline{\zeta}_2$:

$$\begin{aligned}
& \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)} w_2^{\hat{L}_2(\overline{\zeta}_2)}\right] = \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)}\right] \\
= & \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_1^{X_1(\overline{\zeta}_2-\zeta_2)} z_2^{L_2(\zeta_2)} z_2^{X_2(\overline{\zeta}_2-\zeta_2)} z_2^{Y_2(\overline{\zeta}_2-\zeta_2)} w_1^{\hat{L}_1(\zeta_2)} w_1^{\hat{X}_1(\overline{\zeta}_2-\zeta_2)}\right] \\
= & \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_2^{L_2(\zeta_2)}\right] \mathbb{E}\left[z_1^{X_1(\overline{\zeta}_2-\zeta_2)} z_2^{\tilde{X}_2(\overline{\zeta}_2-\zeta_2)} w_1^{\hat{X}_1(\overline{\zeta}_2-\zeta_2)} w_1^{\hat{L}_1(\zeta_2)}\right] \\
= & \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_2^{L_2(\zeta_2)}\right] \mathbb{E}\left[P_1(z_1)^{\overline{\zeta}_2-\zeta_2}\, \tilde{P}_2(z_2)^{\overline{\zeta}_2-\zeta_2}\, \hat{P}(w_1)^{\overline{\zeta}_2-\zeta_2}\, w_1^{\hat{L}_1(\zeta_2)}\right] \\
= & \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_2^{L_2(\zeta_2)}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\zeta_2)} \left\{P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}(w_1)\right\}^{\overline{\zeta}_2-\zeta_2}\right] \\
= & \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_2^{L_2(\zeta_2)}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\zeta_2)} \hat{\theta}_2 \left(P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}(w_1)\right)^{\hat{L}_2\zeta_2}\right] \\
= & F_2(z_1, z_2; \zeta_2)\, \hat{F}_2\left(w_1, \hat{\theta}_2\left(P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}_1(w_1)\right)\right]
\end{aligned}$$

es decir

$$\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)} w_2^{\hat{L}_2(\overline{\zeta}_2)}\right] = \hat{F}_2\left(z_1, z_2, w_1, \hat{\theta}_2\left(P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}_1(w_1)\right)\right) \tag{36.63.9}$$

$$= F_2(z_1, z_2; \zeta_2)\, \hat{F}_2\left(w_1, \hat{\theta}_2\left(P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}_1(w_1)\right)\right) \tag{36.63.10}$$

36.64. Ecuaciones Recursivas para la R.S.V.C.

Con lo desarrollado hasta ahora podemos encontrar las ecuaciones recursivas que modelan la Red de Sistemas de Visitas Cíclicas (R.S.V.C):

$$\begin{aligned}
F_2(z_1, z_2, w_1, w_2) &= R_1(z_1, z_2, w_1, w_2)\, \mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)} z_2^{L_2(\overline{\tau}_1)} w_1^{\hat{L}_1(\overline{\tau}_1)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right] \\
F_1(z_1, z_2, w_1, w_2) &= R_2(z_1, z_2, w_1, w_2)\, \mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)} z_2^{L_2(\overline{\tau}_2)} w_1^{\hat{L}_1(\overline{\tau}_2)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right] \\
\hat{F}_2(z_1, z_2, w_1, w_2) &= \hat{R}_1(z_1, z_2, w_1, w_2)\, \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)} z_2^{L_2(\overline{\zeta}_1)} w_1^{\hat{L}_1(\overline{\zeta}_1)} w_2^{\hat{L}_2(\overline{\zeta}_1)}\right] \\
\hat{F}_1(z_1, z_2, w_1, w_2) &= \hat{R}_2(z_1, z_2, w_1, w_2)\, \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)} w_2^{\hat{L}_2(\overline{\zeta}_2)}\right]
\end{aligned}$$

que son equivalentes a las siguientes ecuaciones

$$F_2(z_1, z_2, w_1, w_2) = R_1\left(P_1(z_1)\, \tilde{P}_2(z_2) \prod_{i=1}^{2} \hat{P}_i(w_i)\right) F_1\left(\theta_1\left(\tilde{P}_2(z_2)\, \hat{P}_1(w_1)\, \hat{P}_2(w_2)\right), z_2, w_1, w_2\right) \tag{36.64.1}$$

$$F_1(z_1, z_2, w_1, w_2) = R_2\left(P_1(z_1)\, \tilde{P}_2(z_2) \prod_{i=1}^{2} \hat{P}_i(w_i)\right) F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\, \hat{P}_1(w_1)\, \hat{P}_2(w_2)\right), w_1, w_2\right) \tag{36.64.2}$$

$$\hat{F}_2(z_1, z_2, w_1, w_2) = \hat{R}_1\left(P_1(z_1)\, \tilde{P}_2(z_2) \prod_{i=1}^{2} \hat{P}_i(w_i)\right) \hat{F}_1\left(z_1, z_2, \hat{\theta}_1\left(P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}_2(w_2)\right), w_2\right) \tag{36.64.3}$$

$$\hat{F}_1(z_1, z_2, w_1, w_2) = \hat{R}_2\left(P_1(z_1)\, \tilde{P}_2(z_2) \prod_{i=1}^{2} \hat{P}_i(w_i)\right) \hat{F}_2\left(z_1, z_2, w_1, \hat{\theta}_2\left(P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}_1(w_1)\right)\right) \tag{36.64.4}$$

36.64.1. Tiempos de Traslado del Servidor

Para

$$R_1(\mathbf{z}, \mathbf{w}) = R_1\left((P_1(z_1)\, \tilde{P}_2(z_2)\, \hat{P}_1(w_1)\, \hat{P}_2(w_2)\right) \tag{36.64.5}$$

se tiene que

$$\begin{aligned}
\tfrac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= R_1^{(1)}(1)\, P_1^{(1)}(1) = r_1\mu_1, & \tfrac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= R_1^{(1)}(1)\, \tilde{P}_2^{(1)}(1) = r_1\tilde{\mu}_2, \\
\tfrac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= R_1^{(1)}(1)\, \hat{P}_1^{(1)}(1) = r_1\hat{\mu}_1, & \tfrac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= R_1^{(1)}(1)\, \hat{P}_2^{(1)}(1) = r_1\hat{\mu}_2,
\end{aligned}$$

Análogamente se tiene

$$R_2(\mathbf{z},\mathbf{w}) = R_2\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right) \tag{36.64.6}$$

$$\begin{array}{ll}\frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} = R_2^{(1)}(1)\,P_1^{(1)}(1) = r_2\mu_1, & \frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} = R_2^{(1)}(1)\,\tilde{P}_2^{(1)}(1) = r_2\tilde{\mu}_2,\\ \frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} = R_2^{(1)}(1)\,\hat{P}_1^{(1)}(1) = r_2\hat{\mu}_1, & \frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} = R_2^{(1)}(1)\,\hat{P}_2^{(1)}(1) = r_2\hat{\mu}_2,\end{array}$$

Para el segundo sistema:

$$\hat{R}_1(\mathbf{z},\mathbf{w}) = \hat{R}_1\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right) \tag{36.64.7}$$

$$\begin{array}{ll}\frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_1^{(1)}(1)\,P_1^{(1)}(1) = \hat{r}_1\mu_1, & \frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_1^{(1)}(1)\,\tilde{P}_2^{(1)}(1) = \hat{r}_1\tilde{\mu}_2,\\ \frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_1^{(1)}(1)\,\hat{P}_1^{(1)}(1) = \hat{r}_1\hat{\mu}_1, & \frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_1^{(1)}(1)\,\hat{P}_2^{(1)}(1) = \hat{r}_1\hat{\mu}_2,\end{array}$$

Finalmente

$$\hat{R}_2(\mathbf{z},\mathbf{w}) = \hat{R}_2\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right) \tag{36.64.8}$$

$$\begin{array}{ll}\frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_2^{(1)}(1)\,P_1^{(1)}(1) = \hat{r}_2\mu_1, & \frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_2^{(1)}(1)\,\tilde{P}_2^{(1)}(1) = \hat{r}_2\tilde{\mu}_2,\\ \frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_2^{(1)}(1)\,\hat{P}_1^{(1)}(1) = \hat{r}_2\hat{\mu}_1, & \frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} = \hat{R}_2^{(1)}(1)\,\hat{P}_2^{(1)}(1) = \hat{r}_2\hat{\mu}_2.\end{array}$$

36.64.2. Usuarios presentes en la cola

Hagamos lo correspondiente con las siguientes expresiones obtenidas en la sección anterior: Recordemos que

$$F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right) = F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2\right)\hat{F}_1(w_1, w_2; \tau_1)$$

entonces

$$\begin{array}{rcl}\frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} & = & 0\\ \frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} & = & \frac{\partial F_1}{\partial z_1}\cdot\frac{\partial \theta_1}{\partial \tilde{P}_2}\cdot\frac{\partial \tilde{P}_2}{\partial z_2} + \frac{\partial F_1}{\partial z_2}\\ \frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} & = & \frac{\partial F_1}{\partial z_1}\cdot\frac{\partial \theta_1}{\partial \hat{P}_1}\cdot\frac{\partial \hat{P}_1}{\partial w_1} + \frac{\partial \hat{F}_1}{\partial w_1}\\ \frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} & = & \frac{\partial F_1}{\partial z_1}\cdot\frac{\partial \theta_1}{\partial \hat{P}_2}\cdot\frac{\partial \hat{P}_2}{\partial w_2} + \frac{\partial \hat{F}_1}{\partial w_2}\end{array}$$

para τ_2:

$$F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), w_1, w_2\right) = F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right)\right)\hat{F}_2(w_1, w_2; \tau_2)$$

al igual que antes

$$
\begin{aligned}
\frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_2}{\partial z_2}\cdot\frac{\partial\tilde{\theta}_2}{\partial P_1}\cdot\frac{\partial P_1}{\partial z_2}+\frac{\partial F_2}{\partial z_1}\\
\frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= 0\\
\frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_2}{\partial z_2}\cdot\frac{\partial\tilde{\theta}_2}{\partial\hat{P}_1}\cdot\frac{\partial\hat{P}_1}{\partial w_1}+\frac{\partial\hat{F}_2}{\partial w_1}\\
\frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_2}{\partial z_2}\cdot\frac{\partial\tilde{\theta}_2}{\partial\hat{P}_2}\cdot\frac{\partial\hat{P}_2}{\partial w_2}+\frac{\partial\hat{F}_2}{\partial w_2}
\end{aligned}
$$

Ahora para el segundo sistema

$$
\hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)=F_1\left(z_1,z_2;\zeta_1\right)\hat{F}_1\left(\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)
$$

entonces

$$
\begin{aligned}
\frac{\partial\hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial\hat{F}_1}{\partial w_1}\cdot\frac{\partial\hat{\theta}_1}{\partial P_1}\cdot\frac{\partial P_1}{\partial z_1}+\frac{\partial F_1}{\partial z_1}\\
\frac{\partial\hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial\hat{F}_1}{\partial w_1}\cdot\frac{\partial\hat{\theta}_1}{\partial\tilde{P}_2}\cdot\frac{\partial\tilde{P}_2}{\partial z_2}+\frac{\partial F_1}{\partial z_2}\\
\frac{\partial\hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= 0\\
\frac{\partial\hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial\hat{F}_1}{\partial w_1}\cdot\frac{\partial\hat{\theta}_1}{\partial\hat{P}_2}\cdot\frac{\partial\hat{P}_2}{\partial w_2}+\frac{\partial\hat{F}_1}{\partial w_2}
\end{aligned}
$$

Finalmente para ζ_2

$$
\hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right) = F_2\left(z_1,z_2;\zeta_2\right)\hat{F}_2\left(w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right]
$$

por tanto:

$$
\begin{aligned}
\frac{\partial\hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial\hat{F}_2}{\partial w_2}\cdot\frac{\partial\hat{\theta}_2}{\partial P_1}\cdot\frac{\partial P_1}{\partial z_1}+\frac{\partial F_2}{\partial z_1}\\
\frac{\partial\hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial\hat{F}_2}{\partial w_2}\cdot\frac{\partial\hat{\theta}_2}{\partial\tilde{P}_2}\cdot\frac{\partial\tilde{P}_2}{\partial z_2}+\frac{\partial F_2}{\partial z_2}\\
\frac{\partial\hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial\hat{F}_2}{\partial w_2}\cdot\frac{\partial\hat{\theta}_2}{\partial\hat{P}_1}\cdot\frac{\partial\hat{P}_1}{\partial w_1}+\frac{\partial\hat{F}_2}{\partial w_1}\\
\frac{\partial\hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= 0
\end{aligned}
$$

36.64.3. Ecuaciones Recursivas

Entonces, de todo lo desarrollado hasta ahora se tienen las siguientes ecuaciones:

$$
\begin{aligned}
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= r_1\mu_1 \\
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= = r_1\tilde{\mu}_2 + f_1(1)\left(\frac{1}{1-\mu_1}\right)\tilde{\mu}_2 + f_1(2) \\
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= r_1\hat{\mu}_1 + f_1(1)\left(\frac{1}{1-\mu_1}\right)\hat{\mu}_1 + \hat{F}^{(1)}_{1,1}(1) \\
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= r_1\hat{\mu}_2 + f_1(1)\left(\frac{1}{1-\mu_1}\right)\hat{\mu}_2 + \hat{F}^{(1)}_{2,1}(1) \\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= r_2\mu_1 + f_2(2)\left(\frac{1}{1-\tilde{\mu}_2}\right)\mu_1 + f_2(1) \\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= r_2\tilde{\mu}_2 \\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= r_2\hat{\mu}_1 + f_2(2)\left(\frac{1}{1-\tilde{\mu}_2}\right)\hat{\mu}_1 + \hat{F}^{(1)}_{2,1}(1) \\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= r_2\hat{\mu}_2 + f_2(2)\left(\frac{1}{1-\tilde{\mu}_2}\right)\hat{\mu}_2 + \hat{F}^{(1)}_{2,2}(1) \\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_1\mu_1 + \hat{f}_1(1)\left(\frac{1}{1-\hat{\mu}_1}\right)\mu_1 + F^{(1)}_{1,1}(1) \\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_1\mu_2 + \hat{f}_1(1)\left(\frac{1}{1-\hat{\mu}_1}\right)\tilde{\mu}_2 + F^{(1)}_{2,1}(1) \\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_1\hat{\mu}_1 \\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_1\hat{\mu}_2 + \hat{f}_1(1)\left(\frac{1}{1-\hat{\mu}_1}\right)\hat{\mu}_2 + \hat{f}_1(2) \\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_2\mu_1 + \hat{f}_2(1)\left(\frac{1}{1-\hat{\mu}_2}\right)\mu_1 + F^{(1)}_{1,2}(1) \\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_2\tilde{\mu}_2 + \hat{f}_2(2)\left(\frac{1}{1-\hat{\mu}_2}\right)\tilde{\mu}_2 + F^{(1)}_{2,2}(1) \\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_2\hat{\mu}_1 + \hat{f}_2(2)\left(\frac{1}{1-\hat{\mu}_2}\right)\hat{\mu}_1 + \hat{f}_2(1) \\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{r}_2\hat{\mu}_2
\end{aligned}
$$

Es decir, se tienen las siguientes ecuaciones:

$$
\begin{aligned}
f_2(1) &= r_1\mu_1 \\
f_1(2) &= r_2\tilde{\mu}_2 \\
f_2(2) &= r_1\tilde{\mu}_2 + \tilde{\mu}_2\left(\frac{f_1(1)}{1-\mu_1}\right) + f_1(2) = \left(r_1 + \frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2 + r_2\tilde{\mu}_2 \\
&= \left(r_1 + r_2 + \frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2 = \left(r + \frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2 \\
f_2(3) &= r_1\hat{\mu}_1 + \hat{\mu}_1\left(\frac{f_1(1)}{1-\mu_1}\right) + \hat{F}^{(1)}_{1,1}(1) = \hat{\mu}_1\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_1}{\mu_1} \\
f_2(4) &= r_1\hat{\mu}_2 + \hat{\mu}_2\left(\frac{f_1(1)}{1-\mu_1}\right) + \hat{F}^{(1)}_{2,1}(1) = \hat{\mu}_2\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_2}{\mu_1} \\
f_1(1) &= r_2\mu_1 + \mu_1\left(\frac{f_2(2)}{1-\tilde{\mu}_2}\right) + r_1\mu_1 = \mu_1\left(r_1 + r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) \\
&= \mu_1\left(r + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) \\
f_1(3) &= r_2\hat{\mu}_1 + \hat{\mu}_1\left(\frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \hat{F}^{(1)}_{1,2}(1) = \hat{\mu}_1\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_1}{\mu_2} \\
f_1(4) &= r_2\hat{\mu}_2 + \hat{\mu}_2\left(\frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \hat{F}^{(1)}_{2,2}(1) = \hat{\mu}_2\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_2}{\mu_2} \\
\hat{f}_1(4) &= \hat{r}_2\hat{\mu}_2 \\
\hat{f}_2(3) &= \hat{r}_1\hat{\mu}_1 \\
\hat{f}_1(1) &= \hat{r}_2\mu_1 + \mu_1\left(\frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right) + F^{(1)}_{1,2}(1) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\mu_1 + \frac{\mu_1}{\hat{\mu}_2} \\
\hat{f}_1(2) &= \hat{r}_2\tilde{\mu}_2 + \tilde{\mu}_2\left(\frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right) + F^{(1)}_{2,2}(1) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\tilde{\mu}_2 + \frac{\mu_2}{\hat{\mu}_2} \\
\hat{f}_1(3) &= \hat{r}_2\hat{\mu}_1 + \hat{\mu}_1\left(\frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right) + \hat{f}_2(3) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 + \hat{r}_1\hat{\mu}_1 \\
&= \left(\hat{r}_1 + \hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 = \left(\hat{r} + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 \\
\hat{f}_2(1) &= \hat{r}_1\mu_1 + \mu_1\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + F^{(1)}_{1,1}(1) = \left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\mu_1 + \frac{\mu_1}{\hat{\mu}_1} \\
\hat{f}_2(2) &= \hat{r}_1\tilde{\mu}_2 + \tilde{\mu}_2\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + F^{(1)}_{2,1}(1) = \left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\tilde{\mu}_2 + \frac{\mu_2}{\hat{\mu}_1} \\
\hat{f}_2(4) &= \hat{r}_1\hat{\mu}_2 + \hat{\mu}_2\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + \hat{f}_1(4) = \hat{r}_1\hat{\mu}_2 + \hat{r}_2\hat{\mu}_2 + \hat{\mu}_2\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) \\
&= \left(\hat{r} + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\hat{\mu}_2
\end{aligned}
$$

es decir,

$$
\begin{array}{lll}
f_1(1) = \mu_1\left(r + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) & f_1(2) = r_2\tilde{\mu}_2 & f_1(3) = \hat{\mu}_1\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_1}{\mu_2} \\
f_1(4) = \hat{\mu}_2\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_2}{\mu_2} & f_2(1) = r_1\mu_1 & f_2(2) = \left(r + \frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2 \\
f_2(3) = \hat{\mu}_1\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_1}{\mu_1} & f_2(4) = \hat{\mu}_2\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_2}{\mu_1} & \hat{f}_1(1) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\mu_1 + \frac{\mu_1}{\hat{\mu}_2} \\
\hat{f}_1(2) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\tilde{\mu}_2 + \frac{\mu_2}{\hat{\mu}_2} & \hat{f}_1(3) = \left(\hat{r} + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 & \hat{f}_1(4) = \hat{r}_2\hat{\mu}_2 \\
\hat{f}_2(1) = \left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\mu_1 + \frac{\mu_1}{\hat{\mu}_1} & \hat{f}_2(2) = \left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\tilde{\mu}_2 + \frac{\mu_2}{\hat{\mu}_1} & \hat{f}_2(3) = \hat{r}_1\hat{\mu}_1 \\
 & \hat{f}_2(4) = \left(\hat{r} + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\hat{\mu}_2 &
\end{array}
$$

36.64.4. Solución del Sistema de Ecuaciones Lineales

A saber, se puede demostrar que la solución del sistema de ecuaciones está dado por las siguientes expresiones, donde

$$\mu = \mu_1 + \tilde{\mu}_2 \ , \ \hat{\mu} = \hat{\mu}_1 + \hat{\mu}_2 \ , \ r = r_1 + r_2 \text{ y } \hat{r} = \hat{r}_1 + \hat{r}_2$$

entonces

$$
\begin{array}{lll}
f_1(1) = r\frac{\mu_1(1-\mu_1)}{1-\mu} & f_1(3) = \hat{\mu}_1\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right) & f_1(4) = \hat{\mu}_2\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right) \\
f_2(2) = r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu} & f_2(3) = \hat{\mu}_1\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right) & f_2(4) = \hat{\mu}_2\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right) \\
\hat{f}_1(1) = \mu_1\left(\frac{\hat{r}_2\hat{\mu}_2+1}{\hat{\mu}_2} + \hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right) & \hat{f}_1(2) = \tilde{\mu}_2\left(\hat{r}_2 + \hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right) + \frac{\mu_2}{\hat{\mu}_2} & \hat{f}_1(3) = \hat{r}\frac{\hat{\mu}_1(1-\hat{\mu}_1)}{1-\hat{\mu}} \\
\hat{f}_2(1) = \mu_1\left(\frac{\hat{r}_1\hat{\mu}_1+1}{\hat{\mu}_1} + \hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right) & \hat{f}_2(2) = \tilde{\mu}_2\left(\hat{r}_1 + \hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right) + \frac{\mu_2}{\hat{\mu}_1} & \hat{f}_2(4) = \hat{r}\frac{\hat{\mu}_2(1-\hat{\mu}_2)}{1-\hat{\mu}}
\end{array}
$$

A saber

$$
\begin{aligned}
f_1(3) &= \hat{\mu}_1\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_1}{\mu_2} = \hat{\mu}_1\left(r_2 + \frac{r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu}}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_1}{\mu_2} = \hat{\mu}_1\left(r_2 + \frac{r\tilde{\mu}_2}{1-\mu}\right) + \frac{\hat{\mu}_1}{\mu_2} \\
&= \hat{\mu}_1\left(r_2 + \frac{r\tilde{\mu}_2}{1-\mu} + \frac{1}{\mu_2}\right) = \hat{\mu}_1\left(\frac{r_2\mu_2+1}{\mu_2} + \frac{r\tilde{\mu}_2}{1-\mu}\right)
\end{aligned}
$$

$$
\begin{aligned}
f_1(4) &= \hat{\mu}_2\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_2}{\mu_2} = \hat{\mu}_2\left(r_2 + \frac{r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu}}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_2}{\mu_2} = \hat{\mu}_2\left(r_2 + \frac{r\tilde{\mu}_2}{1-\mu}\right) + \frac{\hat{\mu}_1}{\mu_2} \\
&= \hat{\mu}_2\left(r_2 + \frac{r\tilde{\mu}_2}{1-\mu} + \frac{1}{\mu_2}\right) = \hat{\mu}_2\left(\frac{r_2\mu_2+1}{\mu_2} + \frac{r\tilde{\mu}_2}{1-\mu}\right)
\end{aligned}
$$

$$
\begin{aligned}
f_2(3) &= \hat{\mu}_1\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_1}{\mu_1} = \hat{\mu}_1\left(r_1 + \frac{r\frac{\mu_1(1-\mu_1)}{1-\mu}}{1-\mu_1}\right) + \frac{\hat{\mu}_1}{\mu_1} = \hat{\mu}_1\left(r_1 + \frac{r\mu_1}{1-\mu}\right) + \frac{\hat{\mu}_1}{\mu_1} \\
&= \hat{\mu}_1\left(r_1 + \frac{r\mu_1}{1-\mu} + \frac{1}{\mu_1}\right) = \hat{\mu}_1\left(\frac{r_1\mu_1+1}{\mu_1} + \frac{r\mu_1}{1-\mu}\right)
\end{aligned}
$$

$$
\begin{aligned}
f_2(4) &= \hat{\mu}_2\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + \frac{\hat{\mu}_2}{\mu_1} = \hat{\mu}_2\left(r_1 + \frac{r\frac{\mu_1(1-\mu_1)}{1-\mu}}{1-\mu_1}\right) + \frac{\hat{\mu}_1}{\mu_1} = \hat{\mu}_2\left(r_1 + \frac{r\mu_1}{1-\mu}\right) + \frac{\hat{\mu}_1}{\mu_1} \\
&= \hat{\mu}_2\left(r_1 + \frac{r\mu_1}{1-\mu} + \frac{1}{\mu_1}\right) = \hat{\mu}_2\left(\frac{r_1\mu_1+1}{\mu_1} + \frac{r\mu_1}{1-\mu}\right)
\end{aligned}
$$

$$
\begin{aligned}
\hat{f}_1(1) &= \mu_1\left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\tilde{\mu}_2}\right) + \frac{\mu_1}{\hat{\mu}_2} = \mu_1\left(\hat{r}_2 + \frac{\hat{r}\frac{\hat{\mu}_2(1-\hat{\mu}_2)}{1-\hat{\mu}}}{1-\hat{\mu}_2}\right) + \frac{\mu_1}{\hat{\mu}_2} = \mu_1\left(\hat{r}_2 + \frac{\hat{r}\hat{\mu}_2}{1-\hat{\mu}}\right) + \frac{\mu_1}{\mu_2} \\
&= \mu_1\left(\hat{r}_2 + \frac{\hat{r}\mu_2}{1-\hat{\mu}} + \frac{1}{\hat{\mu}_2}\right) = \mu_1\left(\frac{\hat{r}_2\hat{\mu}_2+1}{\hat{\mu}_2} + \frac{\hat{r}\hat{\mu}_2}{1-\hat{\mu}}\right)
\end{aligned}
$$

$$
\hat{f}_1(2) = \tilde{\mu}_2\left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\tilde{\mu}_2}\right) + \frac{\mu_2}{\hat{\mu}_2} = \tilde{\mu}_2\left(\hat{r}_2 + \frac{\hat{r}\frac{\hat{\mu}_2(1-\hat{\mu}_2)}{1-\hat{\mu}}}{1-\hat{\mu}_2}\right) + \frac{\mu_2}{\hat{\mu}_2} = \tilde{\mu}_2\left(\hat{r}_2 + \frac{\hat{r}\hat{\mu}_2}{1-\hat{\mu}}\right) + \frac{\mu_2}{\hat{\mu}_2}
$$

$$
\begin{aligned}
\hat{f}_2(1) &= \mu_1\left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + \frac{\mu_1}{\hat{\mu}_1} = \mu_1\left(\hat{r}_1 + \frac{\hat{r}\frac{\hat{\mu}_1(1-\hat{\mu}_1)}{1-\hat{\mu}}}{1-\hat{\mu}_1}\right) + \frac{\mu_1}{\hat{\mu}_1} = \mu_1\left(\hat{r}_1 + \frac{\hat{r}\hat{\mu}_1}{1-\hat{\mu}}\right) + \frac{\mu_1}{\hat{\mu}_1} \\
&= \mu_1\left(\hat{r}_1 + \frac{\hat{r}\hat{\mu}_1}{1-\hat{\mu}} + \frac{1}{\hat{\mu}_1}\right) = \mu_1\left(\frac{\hat{r}_1\hat{\mu}_1+1}{\hat{\mu}_1} + \frac{\hat{r}\hat{\mu}_1}{1-\hat{\mu}}\right)
\end{aligned}
$$

$$
\hat{f}_2(2) = \tilde{\mu}_2\left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\tilde{\mu}_1}\right) + \frac{\mu_2}{\hat{\mu}_1} = \tilde{\mu}_2\left(\hat{r}_1 + \frac{\hat{r}\frac{\hat{\mu}_1(1-\hat{\mu}_1)}{1-\hat{\mu}}}{1-\hat{\mu}_1}\right) + \frac{\mu_2}{\hat{\mu}_1} = \tilde{\mu}_2\left(\hat{r}_1 + \frac{\hat{r}\hat{\mu}_1}{1-\hat{\mu}}\right) + \frac{\mu_2}{\hat{\mu}_1}
$$

36.65. Resultado Principal

Sean $\mu_1, \mu_2, \breve{\mu}_2, \hat{\mu}_1, \hat{\mu}_2$ y $\tilde{\mu}_2 = \mu_2 + \breve{\mu}_2$ los valores esperados de los proceso definidos anteriormente, y sean $r_1, r_2, \hat{r}_1$ y $\hat{r}_2$ los valores esperado s de los tiempos de traslado del servidor entre las colas para cada uno de los sistemas de visitas cíclicas. Si se definen $\mu = \mu_1 + \tilde{\mu}_2$, $\hat{\mu} = \hat{\mu}_1 + \hat{\mu}_2$, y $r = r_1 + r_2$ y $\hat{r} = \hat{r}_1 + \hat{r}_2$, entonces se tiene el siguiente resultado.

Teorema 36.65.1 *Supongamos que $\mu < 1$, $\hat{\mu} < 1$, entonces, el número de usuarios presentes en cada una de las colas que conforman la Red de Sistemas de Visitas Cíclicas cuando uno de los servidores visita a alguna de ellas está dada por la solución del Sistema de Ecuaciones Lineales presentados arriba cuyas expresiones damos a continuación:*

$$\begin{array}{lll}
f_1(1) = r\frac{\mu_1(1-\mu_1)}{1-\mu}, & f_1(2) = r_2\tilde{\mu}_2, & f_1(3) = \hat{\mu}_1\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right), \\
f_1(4) = \hat{\mu}_2\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right), & f_2(1) = r_1\mu_1, & f_2(2) = r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu}, \\
f_2(3) = \hat{\mu}_1\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right), & f_2(4) = \hat{\mu}_2\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right), & \hat{f}_1(1) = \mu_1\left(\frac{\hat{r}_2\hat{\mu}_2+1}{\hat{\mu}_2} + \hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right), \\
\hat{f}_1(2) = \tilde{\mu}_2\left(\hat{r}_2 + \hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right) + \frac{\mu_2}{\hat{\mu}_2}, & \hat{f}_1(3) = \hat{r}\frac{\hat{\mu}_1(1-\hat{\mu}_1)}{1-\hat{\mu}}, & \hat{f}_1(4) = \hat{r}_2\hat{\mu}_2, \\
\hat{f}_2(1) = \mu_1\left(\frac{\hat{r}_1\hat{\mu}_1+1}{\hat{\mu}_1} + \hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right), & \hat{f}_2(2) = \tilde{\mu}_2\left(\hat{r}_1 + \hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right) + \frac{\hat{\mu}_2}{\hat{\mu}_1}, & \hat{f}_2(3) = \hat{r}_1\hat{\mu}_1, \\
 & \hat{f}_2(4) = \hat{r}\frac{\hat{\mu}_2(1-\hat{\mu}_2)}{1-\hat{\mu}}. &
\end{array}$$

36.66. Segundos Momentos

Para poder determinar los segundos momentos para los tiempos de traslado del servidor es necesaria la siguiente proposición:

Proposición 36.66.1 *Sea $f(g(x)h(y))$ función continua tal que tiene derivadas parciales mixtas de segundo orden, entonces se tiene lo siguiente:*

$$\frac{\partial}{\partial x} f(g(x)h(y)) = \frac{\partial f(g(x)h(y))}{\partial x} \cdot \frac{\partial g(x)}{\partial x} \cdot h(y)$$

por tanto

$$\frac{\partial}{\partial x}\frac{\partial}{\partial x} f(g(x)h(y)) = \frac{\partial^2}{\partial x} f(g(x)h(y)) \cdot \left(\frac{\partial g(x)}{\partial x}\right)^2 \cdot h^2(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g^2(x)}{\partial x^2} \cdot h(y) \quad (36.66.1)$$

y

$$\frac{\partial}{\partial y}\frac{\partial}{\partial x} f(g(x)h(y)) = \frac{\partial g(x)}{\partial x} \cdot \frac{\partial h(y)}{\partial y}\left\{\frac{\partial^2}{\partial y \partial x} f(g(x)h(y)) \cdot g(x) \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y))\right\}$$

Demostración 36.66.1

$$\begin{aligned}
\frac{\partial}{\partial x}\frac{\partial}{\partial x} f(g(x)h(y)) &= \frac{\partial}{\partial x}\left\{\frac{\partial f(g(x)h(y))}{\partial x} \cdot \frac{\partial g(x)}{\partial x} \cdot h(y)\right\} \\
&= \frac{\partial}{\partial x}\left\{\frac{\partial}{\partial x} f(g(x)h(y))\right\} \cdot \frac{\partial g(x)}{\partial x} \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g^2(x)}{\partial x^2} \cdot h(y) \\
&= \frac{\partial^2}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g(x)}{\partial x} \cdot h(y) \cdot \frac{\partial g(x)}{\partial x} \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g^2(x)}{\partial x^2} \cdot h(y) \\
&= \frac{\partial^2}{\partial x} f(g(x)h(y)) \cdot \left(\frac{\partial g(x)}{\partial x}\right)^2 \cdot h^2(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g^2(x)}{\partial x^2} \cdot h(y).
\end{aligned}$$

Por otra parte:

$$\begin{aligned}
\frac{\partial}{\partial y}\frac{\partial}{\partial x} f(g(x)h(y)) &= \frac{\partial}{\partial y}\left\{\frac{\partial f(g(x)h(y))}{\partial x} \cdot \frac{\partial g(x)}{\partial x} \cdot h(y)\right\} \\
&= \frac{\partial}{\partial y}\left\{\frac{\partial}{\partial x} f(g(x)h(y))\right\} \cdot \frac{\partial g(x)}{\partial x} \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g(x)}{\partial x} \cdot \frac{\partial h(y)}{y} \\
&= \frac{\partial^2}{\partial y \partial x} f(g(x)h(y)) \cdot \frac{\partial h(y)}{\partial y} \cdot g(x) \cdot \frac{\partial g(x)}{\partial x} \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y)) \cdot \frac{\partial g(x)}{\partial x} \cdot \frac{\partial h(y)}{\partial y} \\
&= \frac{\partial g(x)}{\partial x} \cdot \frac{\partial h(y)}{\partial y}\left\{\frac{\partial^2}{\partial y \partial x} f(g(x)h(y)) \cdot g(x) \cdot h(y) + \frac{\partial}{\partial x} f(g(x)h(y))\right\}
\end{aligned}$$

Utilizando la proposición anterior (Proposiciíon 36.85.1)se tiene el siguiente resultado que me dice como calcular los segundos momentos para los procesos de traslado del servidor:

Proposición 36.66.2 *Sea R_i la Función Generadora de Probabilidades para el número de arribos a cada una de las colas de la Red de Sistemas de Visitas Cíclicas definidas como en (36.84.4). Entonces las derivadas parciales están dadas por las siguientes expresiones:*

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_i^2} &= \left(\frac{\partial P_i(z_i)}{\partial z_i}\right)^2\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial^2 z_i}\\ &+ \left(\frac{\partial P_i(z_i)}{\partial z_i}\right)^2\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_i}\end{aligned}$$

y además

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_2\partial z_1} &= \frac{\partial\tilde{P}_2(z_2)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_2\partial z_1}\\ &+ \frac{\partial\tilde{P}_2(z_2)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_1},\end{aligned}$$

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_1} &= \frac{\partial\hat{P}_i(w_i)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_1}\\ &+ \frac{\partial\hat{P}_i(w_i)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_1},\end{aligned}$$

finalmente

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_2} &= \frac{\partial\hat{P}_i(w_i)}{\partial w_i}\cdot\frac{\partial\tilde{P}_2(z_2)}{\partial z_2}\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_2}\\ &+ \frac{\partial\hat{P}_i(w_i)}{\partial w_i}\cdot\frac{\partial\tilde{P}_2(z_2)}{\partial z_1}\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_2},\end{aligned}$$

para $i = 1, 2$.

36.66.1. Sistema de Ecuaciones Lineales para los Segundos Momentos

En el apéndice (36.67) se demuestra que las ecuaciones para las ecuaciones parciales mixtas están dadas por:

$$\begin{aligned}f_1(1,1) &= r_2P_1^{(2)}(1)+\mu_1^2R_2^{(2)}(1)+2\mu_1r_2\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right)+\frac{1}{1-\tilde{\mu}_2}P_1^{(2)}f_2(2)+\mu_1^2\tilde{\theta}_2^{(2)}(1)f_2(2)\\ &+ \frac{\mu_1}{1-\tilde{\mu}_2}f_2(1,2)+\frac{\mu_1}{1-\tilde{\mu}_2}\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2,2)+f_2(1,2)\right)+f_2(1,1),\\ f_1(2,1) &= \mu_1r_2\tilde{\mu}_2+\mu_1\tilde{\mu}_2R_2^{(2)}(1)+r_2\tilde{\mu}_2\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right),\\ f_1(3,1) &= \mu_1\hat{\mu}_1r_2+\mu_1\hat{\mu}_1R_2^{(2)}(1)+r_2\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+r_2\hat{\mu}_1\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right)+\mu_1r_2\hat{F}_{2,1}^{(1)}(1)\\ &+ \left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right)\hat{F}_{2,1}^{(1)}(1)+\frac{\mu_1\hat{\mu}_1}{1-\tilde{\mu}_2}f_2(2)+\mu_1\hat{\mu}_1\tilde{\theta}_2^{(2)}(1)f_2(2)+\mu_1\hat{\mu}_1\left(\frac{1}{1-\tilde{\mu}_2}\right)^2f_2(2,2)\\ &+ +\frac{\hat{\mu}_1}{1-\tilde{\mu}_2}f_2(1,2),\\ f_1(4,1) &= \mu_1\hat{\mu}_2r_2+\mu_1\hat{\mu}_2R_2^{(2)}(1)+r_2\frac{\mu_1\hat{\mu}_2}{1-\tilde{\mu}_2}f_2(2)+\mu_1r_2\hat{F}_{2,2}^{(1)}(1)+r_2\hat{\mu}_2\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right)\\ &+ \hat{F}_{2,1}^{(1)}(1)\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right)+\frac{\mu_1\hat{\mu}_2}{1-\tilde{\mu}_2}f_2(2)+\mu_1\hat{\mu}_2\tilde{\theta}_2^{(2)}(1)f_2(2)+\mu_1\hat{\mu}_2\left(\frac{1}{1-\tilde{\mu}_2}\right)^2f_2(2,2)\\ &+ \frac{\hat{\mu}_2}{1-\tilde{\mu}_2}f_2^{(1,2)},\end{aligned}$$

$$

36.67. Medidas de Desempeño

Definición 36.67.1 *Sea L_i^* el número de usuarios cuando el servidor visita la cola Q_i para dar servicio, para $i = 1, 2$.*

Entonces

Proposición 36.67.1 *Para la cola Q_i, $i = 1, 2$, se tiene que el número de usuarios presentes al momento de ser visitada por el servidor está dado por*

$$\mathbb{E}[L_i^*] = f_i(i) \tag{36.67.1}$$

$$Var[L_i^*] = f_i(i,i) + \mathbb{E}[L_i^*] - \mathbb{E}[L_i^*]^2. \tag{36.67.2}$$

Definición 36.67.2 *El tiempo de Ciclo C_i es el periodo de tiempo que comienza cuando la cola i es visitada por primera vez en un ciclo, y termina cuando es visitado nuevamente en el próximo ciclo, bajo condiciones de estabilidad.*

$$C_i(z) = \mathbb{E}\left[z^{\overline{\tau}_i(m+1) - \overline{\tau}_i(m)}\right]$$

Definición 36.67.3 *El tiempo de intervisita I_i es el periodo de tiempo que comienza cuando se ha completado el servicio en un ciclo y termina cuando es visitada nuevamente en el próximo ciclo.*

$$I_i(z) = \mathbb{E}\left[z^{\tau_i(m+1)-\overline{\tau}_i(m)}\right]$$

Proposición 36.67.2 *Para los tiempos de intervisita del servidor I_i, se tiene que*

$$\begin{aligned}
\mathbb{E}[I_i] &= \frac{f_i(i)}{\mu_i}, \\
Var[I_i] &= \frac{Var\left[L_i^*\right]}{\mu_i^2} - \frac{\sigma_i^2}{\mu_i^2} f_i(i).
\end{aligned}$$

Proposición 36.67.3 *Para los tiempos que ocupa el servidor para atender a los usuarios presentes en la cola Q_i, con FGP denotada por S_i, se tiene que*

$$\begin{aligned}
\mathbb{E}[S_i] &= \frac{\mathbb{E}\left[L_i^*\right]}{1-\mu_i} = \frac{f_i(i)}{1-\mu_i}, \\
Var[S_i] &= \frac{Var\left[L_i^*\right]}{(1-\mu_i)^2} + \frac{\sigma^2 \mathbb{E}\left[L_i^*\right]}{(1-\mu_i)^3}
\end{aligned}$$

Proposición 36.67.4 *Para la duración de los ciclos C_i se tiene que*

$$\begin{aligned}
\mathbb{E}[C_i] &= \mathbb{E}[I_i]\,\mathbb{E}[\theta_i(z)] = \frac{\mathbb{E}\left[L_i^*\right]}{\mu_i}\frac{1}{1-\mu_i} = \frac{f_i(i)}{\mu_i(1-\mu_i)} \\
Var[C_i] &= \frac{Var\left[L_i^*\right]}{\mu_i^2(1-\mu_i)^2}.
\end{aligned}$$

$$\begin{aligned}
&\frac{\partial}{\partial w_1}\frac{\partial}{\partial w_2}\left(\hat{R}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)\hat{F}_1\left(\hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right),w_2\right)F_1(z_1,z_2)\right)\\
=\;& \hat{r}_1\hat{\mu}_2\hat{\mu}_1+\hat{\mu}_2\hat{\mu}_1\hat{R}_1^{(2)}(1)+\hat{r}_1\hat{\mu}_1\left(\hat{F}_1^{(0,1)}+\frac{\hat{\mu}_2}{1-\hat{\mu}_1}\hat{F}_1^{(1,0)}\right).
\end{aligned}$$

16.

$$\begin{aligned}
&\frac{\partial}{\partial w_2}\frac{\partial}{\partial w_2}\left(\hat{R}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)\hat{F}_1\left(\hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right),w_2\right)F_1(z_1,z_2)\right)\\
=\;& \hat{r}_1\hat{P}_2^{(2)}(1)+\hat{\mu}_2^2\hat{R}_1^{(2)}(1)+2\hat{r}_1\hat{\mu}_2\left(\hat{F}_1^{(0,1)}+\frac{\hat{\mu}_2}{1-\hat{\mu}_1}\hat{F}_1^{(1,0)}\right)+\hat{F}_1^{(0,2)}+\frac{1}{1-\hat{\mu}_1}\hat{P}_2^{(2)}(1)\hat{F}_1^{(1,0)}\\
+\;& \hat{\mu}_2^2\hat{\theta}_1^{(2)}(1)\hat{F}_1^{(1,0)}+\frac{\hat{\mu}_2}{1-\hat{\mu}_1}\hat{F}_1^{(1,1)}+\frac{\hat{\mu}_2}{1-\hat{\mu}_1}\left(\hat{F}_1^{(1,1)}+\frac{\hat{\mu}_2}{1-\hat{\mu}_1}\hat{F}_1^{(2,0)}\right).
\end{aligned}$$

Las ecuaciones que determinan los segundos momentos de las longitudes de las colas de los dos sistemas se pueden ver en este sitio

Apéndice B

36.67.1. Distribución para los usuarios de traslado

Ahora, determinemos la distribución del número de usuarios que pasan de $\hat{Q}_2$ a Q_2 considerando dos políticas de traslado en específico:

1. Solamente pasa un usuario,
2. Se permite el paso de k usuarios,

una vez que son atendidos por el servidor en $\hat{Q}_2$.

Política de un solo usuario: Sea R_2 el número de usuarios que llegan a $\hat{Q}_2$ al tiempo t, sea R_1 el número de usuarios que pasan de $\hat{Q}_2$ a Q_2 al tiempo t.

A saber:

$$\begin{aligned}
\mathbb{E}[R_1] &= \sum_{y\geq 0} \mathbb{P}[R_2 = y]\,\mathbb{E}[R_1|R_2 = y] \\
&= \sum_{y\geq 0} \mathbb{P}[R_2 = y] \sum_{x\geq 0} x\mathbb{P}[R_1 = x|R_2 = y] \\
&= \sum_{y\geq 0}\sum_{x\geq 0} x\mathbb{P}[R_1 = x|R_2 = y]\,\mathbb{P}[R_2 = y].
\end{aligned}$$

Determinemos

$$\mathbb{E}[R_1|R_2 = y] = \sum_{x\geq 0} x\mathbb{P}[R_1 = x|R_2 = y]. \tag{36.67.3}$$

supongamos que $y = 0$, entonces

$$\begin{aligned}
\mathbb{P}[R_1 = 0|R_2 = 0] &= 1, \\
\mathbb{P}[R_1 = x|R_2 = 0] &= 0, \text{ para cualquier } x \geq 1,
\end{aligned}$$

por tanto

$$\mathbb{E}[R_1|R_2 = 0] = 0.$$

Para $y = 1$,

$$\begin{aligned}
\mathbb{P}[R_1 = 0|R_2 = 1] &= 0, \\
\mathbb{P}[R_1 = 1|R_2 = 1] &= 1,
\end{aligned}$$

entonces

$$\mathbb{E}[R_1|R_2 = 1] = 1.$$

Para $y > 1$:

$$\begin{aligned}
\mathbb{P}[R_1 = 0|R_2 \geq 1] &= 0, \\
\mathbb{P}[R_1 = 1|R_2 \geq 1] &= 1, \\
\mathbb{P}[R_1 > 1|R_2 \geq 1] &= 0,
\end{aligned}$$

entonces

$$\mathbb{E}[R_1|R_2 = y] = 1, \text{ para cualquier } y > 1.$$

es decir

$$\mathbb{E}[R_1|R_2 = y] = 1, \text{ para cualquier } y \geq 1.$$

Entonces

$$\begin{aligned}
\mathbb{E}[R_1] &= \sum_{y\geq 0}\sum_{x\geq 0} x\mathbb{P}[R_1 = x|R_2 = y]\,\mathbb{P}[R_2 = y] = \sum_{y\geq 0}\sum_{x} \mathbb{E}[R_1|R_2 = y]\,\mathbb{P}[R_2 = y] \\
&= \sum_{y\geq 0} \mathbb{P}[R_2 = y] = \sum_{y\geq 1} \frac{(\lambda t)^k}{k!} e^{-\lambda t} = 1.
\end{aligned}$$

Además para $k \in Z^+$

$$\begin{aligned}
f_{R_1}(k) &= \mathbb{P}[R_1 = k] = \sum_{n=0}^{\infty} \mathbb{P}[R_1 = k|R_2 = n]\,\mathbb{P}[R_2 = n] \\
&= \mathbb{P}[R_1 = k|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = k|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\
&+ \mathbb{P}[R_1 = k|R_2 > 1]\,\mathbb{P}[R_2 > 1],
\end{aligned}$$

donde para

$k = 0$**:**

$$\mathbb{P}[R_1 = 0] = \mathbb{P}[R_1 = 0|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = 0|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = 0|R_2 > 1]\,\mathbb{P}[R_2 > 1] = \mathbb{P}[R_2 = 0].$$

$k = 1$**:**

$$\mathbb{P}[R_1 = 1] = \mathbb{P}[R_1 = 1|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = 1|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = 1|R_2 > 1]\,\mathbb{P}[R_2 > 1] = \sum_{n=1}^{\infty}\mathbb{P}[R_2 = n].$$

$k = 2$**:**

$$\mathbb{P}[R_1 = 2] = \mathbb{P}[R_1 = 2|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = 2|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = 2|R_2 > 1]\,\mathbb{P}[R_2 > 1] = 0.$$

$k = j$**:**

$$\mathbb{P}[R_1 = j] = \mathbb{P}[R_1 = j|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = j|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = j|R_2 > 1]\,\mathbb{P}[R_2 > 1] = 0.$$

Por lo tanto

$$\begin{aligned} f_{R_1}(0) &= \mathbb{P}[R_2 = 0] \\ f_{R_1}(1) &= \sum_{n\geq 1}^{\infty}\mathbb{P}[R_2 = n] \\ f_{R_1}(j) &= 0, \text{ para } j > 1. \end{aligned}$$

Política de k usuarios: Al igual que antes, para $y \in Z^+$ fijo

$$\mathbb{E}[R_1|R_2 = y] = \sum_x x\mathbb{P}[R_1 = x|R_2 = y].$$

Entonces, si tomamos diversos valore para y:

$y = 0$:

$$\begin{aligned} \mathbb{P}[R_1 = 0|R_2 = 0] &= 1, \\ \mathbb{P}[R_1 = x|R_2 = 0] &= 0, \text{ para cualquier } x \geq 1, \end{aligned}$$

entonces

$$\mathbb{E}[R_1|R_2 = 0] = 0.$$

Para $y = 1$,

$$\begin{aligned} \mathbb{P}[R_1 = 0|R_2 = 1] &= 0, \\ \mathbb{P}[R_1 = 1|R_2 = 1] &= 1, \end{aligned}$$

entonces

$$\mathbb{E}[R_1|R_2 = 1] = 1.$$

Para $y = 2$,

$$\begin{aligned} \mathbb{P}[R_1 = 0|R_2 = 2] &= 0, \\ \mathbb{P}[R_1 = 1|R_2 = 2] &= 1, \\ \mathbb{P}[R_1 = 2|R_2 = 2] &= 1, \\ \mathbb{P}[R_1 = 3|R_2 = 2] &= 0, \end{aligned}$$

entonces

$$\mathbb{E}[R_1|R_2 = 2] = 3.$$

Para $y = 3$,

$$\begin{aligned} \mathbb{P}[R_1 = 0|R_2 = 3] &= 0, \\ \mathbb{P}[R_1 = 1|R_2 = 3] &= 1, \\ \mathbb{P}[R_1 = 2|R_2 = 3] &= 1, \\ \mathbb{P}[R_1 = 3|R_2 = 3] &= 1, \\ \mathbb{P}[R_1 = 4|R_2 = 3] &= 0, \end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=3\right]=6.$$

En general, para $k\geq 0$,

$$\begin{aligned}\mathbb{P}\left[R_1=0|R_2=k\right] &= 0,\\ \mathbb{P}\left[R_1=j|R_2=k\right] &= 1,\ \text{para } 1\leq j\leq k,\\ \mathbb{P}\left[R_1=j|R_2=k\right] &= 0,\ \text{para } j>k,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=k\right]=\frac{k\left(k+1\right)}{2}.$$

Por lo tanto

$$\begin{aligned}\mathbb{E}\left[R_1\right] &= \sum_{y}\mathbb{E}\left[R_1|R_2=y\right]\mathbb{P}\left[R_2=y\right]\\ &= \sum_{y}\mathbb{P}\left[R_2=y\right]\frac{y\left(y+1\right)}{2}=\sum_{y\geq 1}\left(\frac{y\left(y+1\right)}{2}\right)\frac{\left(\lambda t\right)^{y}}{y!}e^{-\lambda t}\\ &= \frac{\lambda t}{2}e^{-\lambda t}\sum_{y\geq 1}\left(y+1\right)\frac{\left(\lambda t\right)^{y-1}}{\left(y-1\right)!}=\frac{\lambda t}{2}e^{-\lambda t}\left(e^{\lambda t}\left(\lambda t+2\right)\right)\\ &= \frac{\lambda t\left(\lambda t+2\right)}{2},\end{aligned}$$

es decir,

$$\mathbb{E}\left[R_1\right]=\frac{\lambda t\left(\lambda t+2\right)}{2}. \tag{36.67.4}$$

Además para $k\in Z^{+}$ fijo

$$\begin{aligned}f_{R_1}\left(k\right) &= \mathbb{P}\left[R_1=k\right]=\sum_{n=0}^{\infty}\mathbb{P}\left[R_1=k|R_2=n\right]\mathbb{P}\left[R_2=n\right]\\ &= \mathbb{P}\left[R_1=k|R_2=0\right]\mathbb{P}\left[R_2=0\right]+\mathbb{P}\left[R_1=k|R_2=1\right]\mathbb{P}\left[R_2=1\right]\\ &+ \mathbb{P}\left[R_1=k|R_2=2\right]\mathbb{P}\left[R_2=2\right]+\cdots+\mathbb{P}\left[R_1=k|R_2=j\right]\mathbb{P}\left[R_2=j\right]+\cdots+\end{aligned}$$

donde para

$k=0$:

$$\begin{aligned}\mathbb{P}\left[R_1=0\right]=\mathbb{P}\left[R_1=0|R_2=0\right]\mathbb{P}\left[R_2=0\right]+\mathbb{P}\left[R_1=0|R_2=1\right]\mathbb{P}\left[R_2=1\right]\\ +\mathbb{P}\left[R_1=0|R_2=j\right]\mathbb{P}\left[R_2=j\right]=\mathbb{P}\left[R_2=0\right].\end{aligned}$$

$k=1$:

$$\begin{aligned}\mathbb{P}\left[R_1=1\right]=\mathbb{P}\left[R_1=1|R_2=0\right]\mathbb{P}\left[R_2=0\right]+\mathbb{P}\left[R_1=1|R_2=1\right]\mathbb{P}\left[R_2=1\right]\\ +\mathbb{P}\left[R_1=1|R_2=1\right]\mathbb{P}\left[R_2=1\right]+\cdots+\mathbb{P}\left[R_1=1|R_2=j\right]\mathbb{P}\left[R_2=j\right]\\ =\sum_{n=1}^{\infty}\mathbb{P}\left[R_2=n\right].\end{aligned}$$

$k=2$:

$$\begin{aligned}\mathbb{P}\left[R_1=2\right]=\mathbb{P}\left[R_1=2|R_2=0\right]\mathbb{P}\left[R_2=0\right]+\mathbb{P}\left[R_1=2|R_2=1\right]\mathbb{P}\left[R_2=1\right]\\ +\mathbb{P}\left[R_1=2|R_2=2\right]\mathbb{P}\left[R_2=2\right]+\cdots+\mathbb{P}\left[R_1=2|R_2=j\right]\mathbb{P}\left[R_2=j\right]\\ =\sum_{n=2}^{\infty}\mathbb{P}\left[R_2=n\right].\end{aligned}$$

En general

$$\begin{aligned}\mathbb{P}\left[R_1=k\right]=\mathbb{P}\left[R_1=k|R_2=0\right]\mathbb{P}\left[R_2=0\right]+\mathbb{P}\left[R_1=k|R_2=1\right]\mathbb{P}\left[R_2=1\right]\\ +\mathbb{P}\left[R_1=k|R_2=2\right]\mathbb{P}\left[R_2=2\right]+\cdots+\mathbb{P}\left[R_1=k|R_2=k\right]\mathbb{P}\left[R_2=k\right]\\ =\sum_{n=k}^{\infty}\mathbb{P}\left[R_2=n\right].\end{aligned}$$

Por lo tanto

$$f_{R_1}\left(k\right) = \mathbb{P}\left[R_1=k\right]=\sum_{n=k}^{\infty}\mathbb{P}\left[R_2=n\right].$$

Objetivos Principales

- Encontrar las ecuaciones que modelan el comportamiento de una Red de Sistemas de Visitas Cíclicas (RSVC) con propiedades similares.
- Encontrar expresiones analíticas para las longitudes de las colas al momento en que el servidor llega a una de ellas para comenzar a dar servicio, así como de sus segundos momentos.
- Determinar las principales medidas de Desempeño para la RSVC tales como: Número de usuarios presentes en cada una de las colas del sistema cuando uno de los servidores está presente atendiendo, Tiempos que transcurre entre las visitas del servidor a la misma cola.

36.68. Descripción de una Red de Sistemas de Visitas Cíclicas

Consideremos una red de sistema de visitas cíclicas conformada por dos sistemas de visitas cíclicas, cada una con dos colas independientes, donde además se permite el intercambio de usuarios entre los dos sistemas en la segunda cola de cada uno de ellos.

Supóngase además que los arribos de los usuarios ocurren conforme a un proceso Poisson con tasa de llegada μ_1 y μ_2 para el sistema 1, mientras que para el sistema 2, lo hacen conforme a un proceso Poisson con tasa $\hat{\mu}_1, \hat{\mu}_2$ respectivamente.

El traslado de un sistema a otro ocurre de manera que los tiempos entre llegadas de los usuarios a la cola dos del sistema 1 provenientes del sistema 2, se distribuye de manera exponencial con parámetro $\check{\mu}_2$.

Se considerarán intervalos de tiempo de la forma $[t, t+1]$. Los usuarios arriban por paquetes de manera independiente del resto de las colas. Se define el grupo de usuarios que llegan a cada una de las colas del sistema 1, caracterizadas por Q_1 y Q_2 respectivamente, en el intervalo de tiempo $[t, t+1]$ por $X_1(t), X_2(t)$. De igual manera se definen los procesos $\hat{X}_1(t), \hat{X}_2(t)$ para las colas del sistema 2, denotadas por $\hat{Q}_1$ y $\hat{Q}_2$ respectivamente.

Para el número de usuarios que se trasladan del sistema 2 al sistema 1, de la cola $\hat{Q}_2$ a la cola Q_2, en el intervalo de tiempo $[t, t+1]$, se define el proceso $Y_2(t)$.

El uso de la Función Generadora de Probabilidades (FGP's) nos permite determinar las Funciones de Distribución de Probabilidades Conjunta de manera indirecta sin necesidad de hacer uso de las propiedades de las distribuciones de probabilidad de cada uno de los procesos que intervienen en la Red de Sistemas de Visitas Cíclicas.

En lo que respecta al servidor, en términos de los tiempos de visita a cada una de las colas, se definen las variables aleatorias τ_1, τ_2 para Q_1, Q_2 respectivamente; y ζ_1, ζ_2 para $\hat{Q}_1, \hat{Q}_2$ del sistema 2. A los tiempos en que el servidor termina de atender en las colas $Q_1, Q_2, \hat{Q}_1, \hat{Q}_2$, se les denotará por $\overline{\tau}_1, \overline{\tau}_2, \overline{\zeta}_1, \overline{\zeta}_2$ respectivamente.

Los tiempos de traslado del servidor desde el momento en que termina de atender a una cola y llega a la siguiente para comenzar a dar servicio están dados por $\tau_2 - \overline{\tau}_1, \tau_1 - \overline{\tau}_2$ y $\zeta_2 - \overline{\zeta}_1, \zeta_1 - \overline{\zeta}_2$ para el sistema 1 y el sistema 2, respectivamente.

Cada uno de estos procesos con su respectiva FGP. Además, para cada una de las colas en cada sistema, el número de usuarios al tiempo en que llega el servidor a dar servicio está dado por el número de usuarios presentes en la cola al tiempo t, más el número de usuarios que llegan a la cola en el intervalo de tiempo $[\tau_i, \overline{\tau}_i]$.

Una vez definidas las Funciones Generadoras de Probabilidades Conjuntas se construyen las ecuaciones recursivas que permiten obtener la información sobre la longitud de cada una de las colas, al momento en que uno de los servidores llega a una de las colas para dar servicio, basándose en la información que se tiene sobre su llegada a la cola inmediata anterior.

36.68.1. Funciones Generadoras de Probabilidades

Para cada uno de los procesos de llegada a las colas $X_1, X_2, \hat{X}_1, \hat{X}_2$ y Y_2, con $\tilde{X}_2 = X_2 + Y_2$ anteriores se define su Función Generadora de Probabilidades (FGP):

$$P_1(z_1) = \mathbb{E}\left[z_1^{X_1(t)}\right], \quad P_2(z_2) = \mathbb{E}\left[z_2^{X_2(t)}\right], \quad \check{P}_2(z_2) = \mathbb{E}\left[z_2^{Y_2(t)}\right],$$
$$\hat{P}_1(w_1) = \mathbb{E}\left[w_1^{\hat{X}_1(t)}\right], \quad \hat{P}_2(w_2) = \mathbb{E}\left[w_2^{\hat{X}_2(t)}\right], \quad \tilde{P}_2(z_2) = \mathbb{E}\left[z_2^{\tilde{X}_2(t)}\right].$$

Con primer momento definidos por

$$\begin{aligned}
\mu_1 &= \mathbb{E}\left[X_1(t)\right] = P_1^{(1)}(1), & \mu_2 &= \mathbb{E}\left[X_2(t)\right] = P_2^{(1)}(1), \\
\check{\mu}_2 &= \mathbb{E}\left[Y_2(t)\right] = \check{P}_2^{(1)}(1), & \hat{\mu}_1 &= \mathbb{E}\left[\hat{X}_1(t)\right] = \hat{P}_1^{(1)}(1), \\
\hat{\mu}_2 &= \mathbb{E}\left[\hat{X}_2(t)\right] = \hat{P}_2^{(1)}(1), & \tilde{\mu}_2 &= \mathbb{E}\left[\tilde{X}_2(t)\right] = \tilde{P}_2^{(1)}(1).
\end{aligned}$$

En lo que respecta al servidor, en términos de los tiempos de visita a cada una de las colas, se denotarán por $B_1(t), B_2(t)$ los procesos correspondientes a las variables aleatorias τ_1, τ_2 para Q_1, Q_2 respectivamente; y $\hat{B}_1(t), \hat{B}_2(t)$ con parámetros ζ_1, ζ_2 para $\hat{Q}_1, \hat{Q}_2$ del sistema 2. Y a los tiempos en que el servidor termina de atender en las colas $Q_1, Q_2, \hat{Q}_1, \hat{Q}_2$, se les denotará por $\overline{\tau}_1, \overline{\tau}_2, \overline{\zeta}_1, \overline{\zeta}_2$ respectivamente. Entonces, los tiempos de servicio están dados por las diferencias $\overline{\tau}_1 - \tau_1, \overline{\tau}_2 - \tau_2$ para Q_1, Q_2, y $\overline{\zeta}_1 - \zeta_1, \overline{\zeta}_2 - \zeta_2$ para $\hat{Q}_1, \hat{Q}_2$ respectivamente.

Sus procesos se definen por:

$$\begin{aligned}
S_1(z_1) &= \mathbb{E}\left[z_1^{\overline{\tau}_1 - \tau_1}\right], & S_2(z_2) &= \mathbb{E}\left[z_1^{\overline{\tau}_2 - \tau_2}\right], \\
\hat{S}_1(w_1) &= \mathbb{E}\left[w_1^{\overline{\zeta}_1 - \zeta_1}\right], & \hat{S}_2(w_2) &= \mathbb{E}\left[w_2^{\overline{\zeta}_2 - \zeta_2}\right],
\end{aligned}$$

con primer momento dado por:

$$s_1 = \mathbb{E}\left[\overline{\tau}_1 - \tau_1\right], \quad s_2 = \mathbb{E}\left[\overline{\tau}_2 - \tau_2\right], \quad \hat{s}_1 = \mathbb{E}\left[\overline{\zeta}_1 - \zeta_1\right], \quad \hat{s}_2 = \mathbb{E}\left[\overline{\zeta}_2 - \zeta_2\right].$$

Análogamente los tiempos de traslado del servidor desde el momento en que termina de atender a una cola y llega a la siguiente para comenzar a dar servicio están dados por $\tau_2 - \overline{\tau}_1, \tau_1 - \overline{\tau}_2$ y $\zeta_2 - \overline{\zeta}_1, \zeta_1 - \overline{\zeta}_2$ para el sistema 1 y el sistema 2, respectivamente.

La FGP para estos tiempos de traslado están dados por

$$\begin{aligned}
R_1(z_1) &= \mathbb{E}\left[z_1^{\tau_2 - \overline{\tau}_1}\right], & R_2(z_2) &= \mathbb{E}\left[z_2^{\tau_1 - \overline{\tau}_2}\right], \\
\hat{R}_1(w_1) &= \mathbb{E}\left[w_1^{\zeta_2 - \overline{\zeta}_1}\right], & \hat{R}_2(w_2) &= \mathbb{E}\left[w_2^{\zeta_1 - \overline{\zeta}_2}\right],
\end{aligned}$$

y al igual que como se hizo con anterioridad

$$\begin{aligned}
r_1 &= R_1^{(1)}(1) = \mathbb{E}\left[\tau_2 - \overline{\tau}_1\right], & r_2 &= R_2^{(1)}(1) = \mathbb{E}\left[\tau_1 - \overline{\tau}_2\right], \\
\hat{r}_1 &= \hat{R}_1^{(1)}(1) = \mathbb{E}\left[\zeta_2 - \overline{\zeta}_1\right], & \hat{r}_2 &= \hat{R}_2^{(1)}(1) = \mathbb{E}\left[\zeta_1 - \overline{\zeta}_2\right].
\end{aligned}$$

Se definen los procesos de conteo para el número de usuarios en cada una de las colas al tiempo t, $L_1(t), L_2(t)$, para $H_1(t), H_2(t)$ del sistema 1, respectivamente. Y para el segundo sistema, se tienen los procesos $\hat{L}_1(t), \hat{L}_2(t)$ para $\hat{H}_1(t), \hat{H}_2(t)$, respectivamente, es decir,

$$H_1(t) = \mathbb{E}\left[z_1^{L_1(t)}\right], \quad H_2(t) = \mathbb{E}\left[z_2^{L_2(t)}\right], \quad \hat{H}_1(t) = \mathbb{E}\left[w_1^{\hat{L}_1(t)}\right], \quad \hat{H}_2(t) = \mathbb{E}\left[w_2^{\hat{L}_2(t)}\right].$$

Por lo dicho anteriormente se tiene que el número de usuarios presentes en los tiempos $\overline{\tau}_1, \overline{\tau}_2, \overline{\zeta}_1, \overline{\zeta}_2$, es cero, es decir, $L_i(\overline{\tau_i}) = 0$, y $\hat{L}_i\left(\overline{\zeta_i}\right) = 0$ para i=1,2 para cada uno de los dos sistemas.

Para cada una de las colas en cada sistema, el número de usuarios al tiempo en que llega el servidor a dar servicio está dado por el número de usuarios presentes en la cola al tiempo $t = \tau_i, \zeta_i$, más el número de usuarios que llegan a la cola en el intervalo de tiempo $\left[\tau_i, \overline{\tau}_i\right], \left[\zeta_i, \overline{\zeta}_i\right]$, es decir

$$\begin{aligned}
&L_1(\overline{\tau}_1) = L_1(\tau_1) + X_1(\overline{\tau}_1 - \tau_1), \quad \hat{L}_1(\overline{\tau}_1) = \hat{L}_1(\tau_1) + \hat{X}_1(\overline{\tau}_1 - \tau_1), \\
&\hat{L}_2(\overline{\tau}_1) = \hat{L}_2(\tau_1) + \hat{X}_2(\overline{\tau}_1 - \tau_1).
\end{aligned}$$

En el caso específico de Q_2, además, hay que considerar el número de usuarios que pasan del sistema 2 al sistema 1, a traves de $\hat{Q}_2$ mientras el servidor en Q_2 está ausente, es decir:

$$L_2(\overline{\tau}_1) = L_2(\tau_1) + X_2(\overline{\tau}_1 - \tau_1) + Y_2(\overline{\tau}_1 - \tau_1). \tag{36.68.1}$$

36.68.2. La ruina del jugador

Supongamos que se tiene un jugador que cuenta con un capital inicial de $\tilde{L}_0 \geq 0$ unidades, esta persona realiza una serie de dos juegos simultáneos e independientes de manera sucesiva, dichos eventos son independientes e idénticos entre sí para cada realización.

La ganancia en el n-ésimo juego es

$$\tilde{X}_n = X_n + Y_n$$

unidades de las cuales se resta una cuota de 1 unidad por cada juego simultáneo, es decir, se restan dos unidades por cada juego realizado.

En términos de la teoría de colas puede pensarse como el número de usuarios que llegan a una cola vía dos procesos de arribo distintos e independientes entre sí.

Su Función Generadora de Probabilidades (FGP) está dada por

$$F(z) = \mathbb{E}\left[z^{\tilde{L}_0}\right]$$

$$\tilde{P}(z) = \mathbb{E}\left[z^{\tilde{X}_n}\right] = \mathbb{E}\left[z^{X_n+Y_n}\right] = \mathbb{E}\left[z^{X_n} z^{Y_n}\right] = \mathbb{E}\left[z^{X_n}\right]\mathbb{E}\left[z^{Y_n}\right] = P(z)\,\check{P}(z),$$

entonces

$$\tilde{\mu} \quad = \quad \mathbb{E}\left[\tilde{X}_n\right] = \tilde{P}[z] < 1.$$

Sea $\tilde{L}_n$ el capital remanente después del n-ésimo juego. Entonces

$$\tilde{L}_n \quad = \quad \tilde{L}_0 + \tilde{X}_1 + \tilde{X}_2 + \cdots + \tilde{X}_n - 2n.$$

La ruina del jugador ocurre después del n-ésimo juego, es decir, la cola se vacía después del n-ésimo juego, entonces sea T definida como

$$T \quad = \quad min\left\{\tilde{L}_n = 0\right\}$$

Si $\tilde{L}_0 = 0$, entonces claramente $T = 0$. En este sentido T puede interpretarse como la longitud del periodo de tiempo que el servidor ocupa para dar servicio en la cola, comenzando con $\tilde{L}_0$ grupos de usuarios presentes en la cola, quienes arribaron conforme a un proceso dado por $\tilde{P}(z)$.

Sea $g_{n,k}$ la probabilidad del evento de que el jugador no caiga en ruina antes del n-ésimo juego, y que además tenga un capital de k unidades antes del n-ésimo juego, es decir,

Dada $n \in \{1, 2, \ldots, \}$ y $k \in \{0, 1, 2, \ldots, \}$

$$g_{n,k} := P\left\{\tilde{L}_j > 0, j = 1, \ldots, n, \tilde{L}_n = k\right\}$$

la cual además se puede escribir como:

$$\begin{aligned}
g_{n,k} &= P\left\{\tilde{L}_j > 0, j = 1, \ldots, n, \tilde{L}_n = k\right\} = \sum_{j=1}^{k+1} g_{n-1,j} P\left\{\tilde{X}_n = k - j + 1\right\} \\
&= \sum_{j=1}^{k+1} g_{n-1,j} P\{X_n + Y_n = k - j + 1\} = \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j} P\{X_n + Y_n = k - j + 1, Y_n = l\} \\
&= \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j} P\{X_n + Y_n = k - j + 1 | Y_n = l\} P\{Y_n = l\} \\
&= \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j} P\{X_n = k - j - l + 1\} P\{Y_n = l\}
\end{aligned}$$

es decir

$$g_{n,k} = \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j} P\{X_n = k - j - l + 1\} P\{Y_n = l\} \tag{36.68.2}$$

además

$$g_{0,k} = P\left\{\tilde{L}_0 = k\right\}. \tag{36.68.3}$$

Se definen las siguientes FGP:

$$G_n(z) = \sum_{k=0}^{\infty} g_{n,k} z^k, \text{ para } n = 0, 1, \ldots, \tag{36.68.4}$$

$$G(z,w) = \sum_{n=0}^{\infty} G_n(z) w^n. \tag{36.68.5}$$

En particular para $k = 0$,

$$g_{n,0} = G_n(0) = P\left\{\tilde{L}_j > 0, \text{ para } j < n, \text{ y } \tilde{L}_n = 0\right\} = P\{T = n\},$$

además

$$G(0,w) = \sum_{n=0}^{\infty} G_n(0) w^n = \sum_{n=0}^{\infty} P\{T = n\} w^n = \mathbb{E}\left[w^T\right]$$

la cuál resulta ser la FGP del tiempo de ruina T.

Proposición 36.68.1 *Sean $G_n(z)$ y $G(z,w)$ definidas como en (36.81.4) y (36.81.5) respectivamente, entonces*

$$G_n(z) = \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z). \tag{36.68.6}$$

Además

$$G(z,w) = \frac{zF(z) - wP(z)G(0,w)}{z - wR(z)}, \tag{36.68.7}$$

con un único polo en el círculo unitario, además, el polo es de la forma $z = \theta(w)$ y satisface que

i) $\tilde{\theta}(1) = 1$,

ii) $\tilde{\theta}^{(1)}(1) = \frac{1}{1-\tilde{\mu}}$,

iii) $\tilde{\theta}^{(2)}(1) = \frac{\tilde{\mu}}{(1-\tilde{\mu})^2} + \frac{\tilde{\sigma}}{(1-\tilde{\mu})^3}$.

Finalmente, además se cumple que

$$\mathbb{E}\left[w^T\right] = G(0,w) = F\left[\tilde{\theta}(w)\right]. \tag{36.68.8}$$

Multiplicando las ecuaciones (36.81.2) y (36.81.3) por el término z^k:

$$\begin{aligned}
g_{n,k} z^k &= \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j} P\{X_n = k-j-l+1\} P\{Y_n = l\} z^k, \\
g_{0,k} z^k &= P\left\{\tilde{L}_0 = k\right\} z^k,
\end{aligned}$$

ahora sumamos sobre k

$$\begin{aligned}
\sum_{k=0}^{\infty} g_{n,k} z^k &= \sum_{k=0}^{\infty}\sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j} P\{X_n = k-j-l+1\} P\{Y_n = l\} z^k \\
&= \sum_{k=0}^{\infty} z^k \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j} P\{X_n = k-(j+l-1)\} P\{Y_n = l\} \\
&= \sum_{k=0}^{\infty} z^{k+(j+l-1)-(j+l-1)} \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j} P\{X_n = k-(j+l-1)\} P\{Y_n = l\} \\
&= \sum_{k=0}^{\infty}\sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j} z^{j-1} P\{X_n = k-(j+l-1)\} z^{k-(j+l-1)} P\{Y_n = l\} z^l
\end{aligned}$$

luego

$$
\begin{aligned}
&= \sum_{j=1}^{\infty}\sum_{l=1}^{j} g_{n-1,j} z^{j-1} \sum_{k=j+l-1}^{\infty} P\left\{X_n = k-(j+l-1)\right\} z^{k-(j+l-1)} P\left\{Y_n = l\right\} z^{l} \\
&= \sum_{j=1}^{\infty} g_{n-1,j} z^{j-1} \sum_{l=1}^{j} \sum_{k=j+l-1}^{\infty} P\left\{X_n = k-(j+l-1)\right\} z^{k-(j+l-1)} P\left\{Y_n = l\right\} z^{l} \\
&= \sum_{j=1}^{\infty} g_{n-1,j} z^{j-1} \sum_{k=j+l-1}^{\infty} \sum_{l=1}^{j} P\left\{X_n = k-(j+l-1)\right\} z^{k-(j+l-1)} P\left\{Y_n = l\right\} z^{l} \\
&= \sum_{j=1}^{\infty} g_{n-1,j} z^{j-1} \sum_{k=j+l-1}^{\infty} \sum_{l=1}^{j} P\left\{X_n = k-(j+l-1)\right\} z^{k-(j+l-1)} \sum_{l=1}^{j} P\left\{Y_n = l\right\} z^{l} \\
&= \sum_{j=1}^{\infty} g_{n-1,j} z^{j-1} \sum_{l=1}^{\infty} P\left\{Y_n = l\right\} z^{l} \sum_{k=j+l-1}^{\infty} \sum_{l=1}^{j} P\left\{X_n = k-(j+l-1)\right\} z^{k-(j+l-1)} \\
&= \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right] \tilde{P}(z) \sum_{k=j+l-1}^{\infty} \sum_{l=1}^{j} P\left\{X_n = k-(j+l-1)\right\} z^{k-(j+l-1)} \\
&= \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right] \tilde{P}(z) P(z) = \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right] \tilde{P}(z),
\end{aligned}
$$

es decir la ecuación (36.81.4) se puede reescribir como

$$
G_n(z) = \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right] \tilde{P}(z). \tag{36.68.9}
$$

Por otra parte recordemos la ecuación (36.81.4)

$$
G_n(z) = \sum_{k=0}^{\infty} g_{n,k} z^{k}, \text{ entonces } \frac{G_n(z)}{z} = \sum_{k=1}^{\infty} g_{n,k} z^{k-1},
$$

Por lo tanto utilizando la ecuación (36.81.9):

$$
\begin{aligned}
G(z,w) &= \sum_{n=0}^{\infty} G_n(z) w^n = G_0(z) + \sum_{n=1}^{\infty} G_n(z) w^n \\
&= F(z) + \sum_{n=0}^{\infty} \left[G_n(z) - G_n(0)\right] w^n \frac{\tilde{P}(z)}{z} \\
&= F(z) + \frac{w}{z} \sum_{n=0}^{\infty} \left[G_n(z) - G_n(0)\right] w^{n-1} \tilde{P}(z)
\end{aligned}
$$

es decir

$$
G(z,w) = F(z) + \frac{w}{z}\left[G(z,w) - G(0,w)\right] \tilde{P}(z),
$$

entonces

$$
\begin{aligned}
G(z,w) &= F(z) + \frac{w}{z}\left[G(z,w) - G(0,w)\right] \tilde{P}(z) \\
&= F(z) + \frac{w}{z} \tilde{P}(z) G(z,w) - \frac{w}{z} \tilde{P}(z) G(0,w) \\
&\Leftrightarrow \\
G(z,w)\left\{1 - \frac{w}{z}\tilde{P}(z)\right\} &= F(z) - \frac{w}{z} \tilde{P}(z) G(0,w),
\end{aligned}
$$

por lo tanto,

$$
G(z,w) = \frac{zF(z) - w\tilde{P}(z) G(0,w)}{1 - w\tilde{P}(z)}. \tag{36.68.10}
$$

Ahora $G(z,w)$ es analítica en $|z| = 1$.

Sean z, w tales que $|z| = 1$ y $|w| \leq 1$, como $\tilde{P}(z)$ es FGP

$$
|z - \left(z - w\tilde{P}(z)\right)| < |z| \Leftrightarrow |w\tilde{P}(z)| < |z|
$$

es decir, se cumplen las condiciones del Teorema de Rouché y por tanto, z y $z - w\tilde{P}(z)$ tienen el mismo número de ceros en $|z| = 1$. Sea $z = \tilde{\theta}(w)$ la solución única de $z - w\tilde{P}(z)$, es decir

$$\tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right) = 0, \tag{36.68.11}$$

con $|\tilde{\theta}(w)| < 1$. Cabe hacer mención que $\tilde{\theta}(w)$ es la FGP para el tiempo de ruina cuando $\tilde{L}_0 = 1$.

Considerando la ecuación (36.81.11)

$$\begin{aligned}
&\frac{\partial}{\partial w}\tilde{\theta}(w)|_{w=1} - \frac{\partial}{\partial w}\left\{w\tilde{P}\left(\tilde{\theta}(w)\right)\right\}|_{w=1} = 0\\
&\tilde{\theta}^{(1)}(w)|_{w=1} - \frac{\partial}{\partial w}w\left\{\tilde{P}\left(\tilde{\theta}(w)\right)\right\}|_{w=1} - w\frac{\partial}{\partial w}\tilde{P}\left(\tilde{\theta}(w)\right)|_{w=1} = 0\\
&\tilde{\theta}^{(1)}(1) - \tilde{P}\left(\tilde{\theta}(1)\right) - w\left\{\frac{\partial\tilde{P}\left(\tilde{\theta}(w)\right)}{\partial\tilde{\theta}(w)}\cdot\frac{\partial\tilde{\theta}(w)}{\partial w}|_{w=1}\right\} = 0\\
&\tilde{\theta}^{(1)}(1) - \tilde{P}\left(\tilde{\theta}(1)\right) - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)\cdot\tilde{\theta}^{(1)}(1) = 0
\end{aligned}$$

luego

$$\begin{aligned}
&\tilde{\theta}^{(1)}(1) - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)\cdot\tilde{\theta}^{(1)}(1) = \tilde{P}\left(\tilde{\theta}(1)\right)\\
&\tilde{\theta}^{(1)}(1)\left(1 - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)\right) = \tilde{P}\left(\tilde{\theta}(1)\right)\\
&\tilde{\theta}^{(1)}(1) = \frac{\tilde{P}\left(\tilde{\theta}(1)\right)}{\left(1 - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)\right)} = \frac{1}{1-\tilde{\mu}}.
\end{aligned}$$

Ahora determinemos el segundo momento de $\tilde{\theta}(w)$, nuevamente consideremos la ecuación (36.81.11):

$$\begin{aligned}
\tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right) &= 0\\
\frac{\partial}{\partial w}\left\{\tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right)\right\} &= 0\\
\frac{\partial}{\partial w}\left\{\frac{\partial}{\partial w}\left\{\tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right)\right\}\right\} &= 0
\end{aligned}$$

$$\begin{aligned}
&\frac{\partial}{\partial w}\left\{\frac{\partial}{\partial w}\tilde{\theta}(w) - \frac{\partial}{\partial w}\left[w\tilde{P}\left(\tilde{\theta}(w)\right)\right]\right\} = \frac{\partial}{\partial w}\left\{\frac{\partial}{\partial w}\tilde{\theta}(w) - \frac{\partial}{\partial w}\left[w\tilde{P}\left(\tilde{\theta}(w)\right)\right]\right\}\\
=\ &\frac{\partial}{\partial w}\left\{\frac{\partial\tilde{\theta}(w)}{\partial w} - \left[\tilde{P}\left(\tilde{\theta}(w)\right) + w\frac{\partial}{\partial w}R\left(\tilde{\theta}(w)\right)\right]\right\}\\
=\ &\frac{\partial}{\partial w}\left\{\frac{\partial\tilde{\theta}(w)}{\partial w} - \left[\tilde{P}\left(\tilde{\theta}(w)\right) + w\frac{\partial\tilde{P}\left(\tilde{\theta}(w)\right)}{\partial w}\frac{\partial\tilde{\theta}(w)}{\partial w}\right]\right\}\\
=\ &\frac{\partial}{\partial w}\left\{\tilde{\theta}^{(1)}(w) - \tilde{P}\left(\tilde{\theta}(w)\right) - w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)\right\}\\
=\ &\frac{\partial}{\partial w}\tilde{\theta}^{(1)}(w) - \frac{\partial}{\partial w}\tilde{P}\left(\tilde{\theta}(w)\right) - \frac{\partial}{\partial w}\left[w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)\right]
\end{aligned}$$

$$\begin{aligned}
=\ &\frac{\partial}{\partial w}\tilde{\theta}^{(1)}(w) - \frac{\partial\tilde{P}\left(\tilde{\theta}(w)\right)}{\partial\tilde{\theta}(w)}\frac{\partial\tilde{\theta}(w)}{\partial w} - \tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)\\
-\ &w\frac{\partial\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}{\partial w}\tilde{\theta}^{(1)}(w) - w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\frac{\partial\tilde{\theta}^{(1)}(w)}{\partial w}\\
=\ &\tilde{\theta}^{(2)}(w) - \tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w) - \tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)\\
-\ &w\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)\left(\tilde{\theta}^{(1)}(w)\right)^2 - w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(2)}(w)\\
=\ &\tilde{\theta}^{(2)}(w) - 2\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)\\
-\ &w\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)\left(\tilde{\theta}^{(1)}(w)\right)^2 - w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(2)}(w)\\
=\ &\tilde{\theta}^{(2)}(w)\left[1 - w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right] - \tilde{\theta}^{(1)}(w)\left[w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right) + 2\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right]
\end{aligned}$$

luego

$$\begin{aligned}
\tilde{\theta}^{(2)}(w)\left[1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right] &- \tilde{\theta}^{(1)}(w)\left[w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)+2\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right]=0\\
\tilde{\theta}^{(2)}(w) &= \frac{\tilde{\theta}^{(1)}(w)\left[w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)+2R^{(1)}\left(\tilde{\theta}(w)\right)\right]}{1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}\\
\tilde{\theta}^{(2)}(w) &= \frac{\tilde{\theta}^{(1)}(w)\,w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)}{1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}+\frac{2\tilde{\theta}^{(1)}(w)\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}{1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}
\end{aligned}$$

si evaluamos la expresión anterior en $w=1$:

$$\begin{aligned}
\tilde{\theta}^{(2)}(1) &= \frac{\left(\tilde{\theta}^{(1)}(1)\right)^2\tilde{P}^{(2)}\left(\tilde{\theta}(1)\right)}{1-\tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)}+\frac{2\tilde{\theta}^{(1)}(1)\tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)}{1-\tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)}\\
&= \frac{\left(\tilde{\theta}^{(1)}(1)\right)^2\tilde{P}^{(2)}(1)}{1-\tilde{P}^{(1)}(1)}+\frac{2\tilde{\theta}^{(1)}(1)\tilde{P}^{(1)}(1)}{1-\tilde{P}^{(1)}(1)}\\
&= \frac{\left(\frac{1}{1-\tilde{\mu}}\right)^2\tilde{P}^{(2)}(1)}{1-\tilde{\mu}}+\frac{2\left(\frac{1}{1-\tilde{\mu}}\right)\tilde{\mu}}{1-\tilde{\mu}}=\frac{\tilde{P}^{(2)}(1)}{(1-\tilde{\mu})^3}+\frac{2\tilde{\mu}}{(1-\tilde{\mu})^2}
\end{aligned}$$

luego

$$= \frac{\sigma^2-\tilde{\mu}+\tilde{\mu}^2}{(1-\tilde{\mu})^3}+\frac{2\tilde{\mu}}{(1-\tilde{\mu})^2}=\frac{\sigma^2-\tilde{\mu}+\tilde{\mu}^2+2\tilde{\mu}(1-\tilde{\mu})}{(1-\tilde{\mu})^3}$$

es decir

$$\begin{aligned}
\tilde{\theta}^{(2)}(1) &= \frac{\sigma^2+\tilde{\mu}-\tilde{\mu}^2}{(1-\tilde{\mu})^3}=\frac{\sigma^2}{(1-\tilde{\mu})^3}+\frac{\tilde{\mu}(1-\tilde{\mu})}{(1-\tilde{\mu})^3}\\
&= \frac{\sigma^2}{(1-\tilde{\mu})^3}+\frac{\tilde{\mu}}{(1-\tilde{\mu})^2}.
\end{aligned}$$

Corolario 36.68.1 *El tiempo de ruina del jugador tiene primer y segundo momento dados por*

$$\mathbb{E}[T] = \frac{\mathbb{E}\left[\tilde{L}_0\right]}{1-\tilde{\mu}} \tag{36.68.12}$$

$$Var[T] = \frac{Var\left[\tilde{L}_0\right]}{(1-\tilde{\mu})^2}+\frac{\sigma^2\mathbb{E}\left[\tilde{L}_0\right]}{(1-\tilde{\mu})^3}. \tag{36.68.13}$$

Ahora, determinemos la distribución del número de usuarios que pasan de $\hat{Q}_2$ a Q_2 considerando dos políticas de traslado en específico:

1. Solamente pasa un usuario,
2. Se permite el paso de k usuarios,

una vez que son atendidos por el servidor en $\hat{Q}_2$.

Política de un solo usuario: Sea R_2 el número de usuarios que llegan a $\hat{Q}_2$ al tiempo t, sea R_1 el número de usuarios que pasan de $\hat{Q}_2$ a Q_2 al tiempo t.

A saber:

$$\begin{aligned}
\mathbb{E}[R_1] &= \sum_{y\geq 0}\mathbb{P}[R_2=y]\,\mathbb{E}[R_1|R_2=y]\\
&= \sum_{y\geq 0}\mathbb{P}[R_2=y]\sum_{x\geq 0}x\mathbb{P}[R_1=x|R_2=y]\\
&= \sum_{y\geq 0}\sum_{x\geq 0}x\mathbb{P}[R_1=x|R_2=y]\,\mathbb{P}[R_2=y].
\end{aligned}$$

Determinemos

$$\mathbb{E}\left[R_1|R_2=y\right]=\sum_{x\geq 0}x\mathbb{P}\left[R_1=x|R_2=y\right]. \tag{36.68.14}$$

supongamos que $y=0$, entonces

$$\begin{aligned}\mathbb{P}\left[R_1=0|R_2=0\right] &= 1,\\ \mathbb{P}\left[R_1=x|R_2=0\right] &= 0,\ \text{para cualquier } x\geq 1,\end{aligned}$$

por tanto

$$\mathbb{E}\left[R_1|R_2=0\right]=0.$$

Para $y=1$,

$$\begin{aligned}\mathbb{P}\left[R_1=0|R_2=1\right] &= 0,\\ \mathbb{P}\left[R_1=1|R_2=1\right] &= 1,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=1\right]=1.$$

Para $y>1$:

$$\begin{aligned}\mathbb{P}\left[R_1=0|R_2\geq 1\right] &= 0,\\ \mathbb{P}\left[R_1=1|R_2\geq 1\right] &= 1,\\ \mathbb{P}\left[R_1>1|R_2\geq 1\right] &= 0,\end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=y\right]=1,\ \text{para cualquier } y>1.$$

es decir

$$\mathbb{E}\left[R_1|R_2=y\right]=1,\ \text{para cualquier } y\geq 1.$$

Entonces

$$\begin{aligned}\mathbb{E}\left[R_1\right] &= \sum_{y\geq 0}\sum_{x\geq 0}x\mathbb{P}\left[R_1=x|R_2=y\right]\mathbb{P}\left[R_2=y\right]=\sum_{y\geq 0}\sum_{x}\mathbb{E}\left[R_1|R_2=y\right]\mathbb{P}\left[R_2=y\right]\\ &= \sum_{y\geq 0}\mathbb{P}\left[R_2=y\right]=\sum_{y\geq 1}\frac{(\lambda t)^k}{k!}e^{-\lambda t}=1.\end{aligned}$$

Además para $k\in Z^+$

$$\begin{aligned}f_{R_1}(k) &= \mathbb{P}\left[R_1=k\right]=\sum_{n=0}^{\infty}\mathbb{P}\left[R_1=k|R_2=n\right]\mathbb{P}\left[R_2=n\right]\\ &= \mathbb{P}\left[R_1=k|R_2=0\right]\mathbb{P}\left[R_2=0\right]+\mathbb{P}\left[R_1=k|R_2=1\right]\mathbb{P}\left[R_2=1\right]\\ &+ \mathbb{P}\left[R_1=k|R_2>1\right]\mathbb{P}\left[R_2>1\right],\end{aligned}$$

donde para

$k=0$**:**

$$\begin{aligned}\mathbb{P}\left[R_1=0\right]=\mathbb{P}\left[R_1=0|R_2=0\right]\mathbb{P}\left[R_2=0\right]+\mathbb{P}\left[R_1=0|R_2=1\right]\mathbb{P}\left[R_2=1\right]\\ +\mathbb{P}\left[R_1=0|R_2>1\right]\mathbb{P}\left[R_2>1\right]=\mathbb{P}\left[R_2=0\right].\end{aligned}$$

$k=1$**:**

$$\begin{aligned}\mathbb{P}\left[R_1=1\right]=\mathbb{P}\left[R_1=1|R_2=0\right]\mathbb{P}\left[R_2=0\right]+\mathbb{P}\left[R_1=1|R_2=1\right]\mathbb{P}\left[R_2=1\right]\\ +\mathbb{P}\left[R_1=1|R_2>1\right]\mathbb{P}\left[R_2>1\right]=\sum_{n=1}^{\infty}\mathbb{P}\left[R_2=n\right].\end{aligned}$$

$k=2$**:**

$$\begin{aligned}\mathbb{P}\left[R_1=2\right]=\mathbb{P}\left[R_1=2|R_2=0\right]\mathbb{P}\left[R_2=0\right]+\mathbb{P}\left[R_1=2|R_2=1\right]\mathbb{P}\left[R_2=1\right]\\ +\mathbb{P}\left[R_1=2|R_2>1\right]\mathbb{P}\left[R_2>1\right]=0.\end{aligned}$$

$k=j$**:**

$$\begin{aligned}\mathbb{P}\left[R_1=j\right]=\mathbb{P}\left[R_1=j|R_2=0\right]\mathbb{P}\left[R_2=0\right]+\mathbb{P}\left[R_1=j|R_2=1\right]\mathbb{P}\left[R_2=1\right]\\ +\mathbb{P}\left[R_1=j|R_2>1\right]\mathbb{P}\left[R_2>1\right]=0.\end{aligned}$$

Por lo tanto

$$\begin{aligned} f_{R_1}(0) &= \mathbb{P}[R_2 = 0] \\ f_{R_1}(1) &= \sum_{n\geq 1}^{\infty} \mathbb{P}[R_2 = n] \\ f_{R_1}(j) &= 0, \text{ para } j > 1. \end{aligned}$$

Política de k usuarios: Al igual que antes, para $y \in Z^+$ fijo

$$\mathbb{E}[R_1|R_2 = y] = \sum_x x\mathbb{P}[R_1 = x|R_2 = y].$$

Entonces, si tomamos diversos valore para y:

$y = 0$:

$$\begin{aligned} \mathbb{P}[R_1 = 0|R_2 = 0] &= 1, \\ \mathbb{P}[R_1 = x|R_2 = 0] &= 0, \text{ para cualquier } x \geq 1, \end{aligned}$$

entonces

$$\mathbb{E}[R_1|R_2 = 0] = 0.$$

Para $y = 1$,

$$\begin{aligned} \mathbb{P}[R_1 = 0|R_2 = 1] &= 0, \\ \mathbb{P}[R_1 = 1|R_2 = 1] &= 1, \end{aligned}$$

entonces

$$\mathbb{E}[R_1|R_2 = 1] = 1.$$

Para $y = 2$,

$$\begin{aligned} \mathbb{P}[R_1 = 0|R_2 = 2] &= 0, \\ \mathbb{P}[R_1 = 1|R_2 = 2] &= 1, \\ \mathbb{P}[R_1 = 2|R_2 = 2] &= 1, \\ \mathbb{P}[R_1 = 3|R_2 = 2] &= 0, \end{aligned}$$

entonces

$$\mathbb{E}[R_1|R_2 = 2] = 3.$$

Para $y = 3$,

$$\begin{aligned} \mathbb{P}[R_1 = 0|R_2 = 3] &= 0, \\ \mathbb{P}[R_1 = 1|R_2 = 3] &= 1, \\ \mathbb{P}[R_1 = 2|R_2 = 3] &= 1, \\ \mathbb{P}[R_1 = 3|R_2 = 3] &= 1, \\ \mathbb{P}[R_1 = 4|R_2 = 3] &= 0, \end{aligned}$$

entonces

$$\mathbb{E}[R_1|R_2 = 3] = 6.$$

En general, para $k \geq 0$,

$$\begin{aligned} \mathbb{P}[R_1 = 0|R_2 = k] &= 0, \\ \mathbb{P}[R_1 = j|R_2 = k] &= 1, \text{ para } 1 \leq j \leq k, \\ \mathbb{P}[R_1 = j|R_2 = k] &= 0, \text{ para } j > k, \end{aligned}$$

entonces

$$\mathbb{E}[R_1|R_2 = k] = \frac{k(k+1)}{2}.$$

Por lo tanto

$$\begin{aligned}
\mathbb{E}[R_1] &= \sum_y \mathbb{E}[R_1|R_2=y]\,\mathbb{P}[R_2=y] \\
&= \sum_y \mathbb{P}[R_2=y]\,\frac{y(y+1)}{2} = \sum_{y\geq 1}\left(\frac{y(y+1)}{2}\right)\frac{(\lambda t)^y}{y!}e^{-\lambda t} \\
&= \frac{\lambda t}{2}e^{-\lambda t}\sum_{y\geq 1}(y+1)\frac{(\lambda t)^{y-1}}{(y-1)!} = \frac{\lambda t}{2}e^{-\lambda t}\left(e^{\lambda t}(\lambda t+2)\right) \\
&= \frac{\lambda t(\lambda t+2)}{2},
\end{aligned}$$

es decir,

$$\mathbb{E}[R_1] = \frac{\lambda t(\lambda t+2)}{2}. \tag{36.68.15}$$

Además para $k \in Z^+$ fijo

$$\begin{aligned}
f_{R_1}(k) &= \mathbb{P}[R_1=k] = \sum_{n=0}^{\infty}\mathbb{P}[R_1=k|R_2=n]\,\mathbb{P}[R_2=n] \\
&= \mathbb{P}[R_1=k|R_2=0]\,\mathbb{P}[R_2=0] + \mathbb{P}[R_1=k|R_2=1]\,\mathbb{P}[R_2=1] \\
&+ \mathbb{P}[R_1=k|R_2=2]\,\mathbb{P}[R_2=2] + \cdots + \mathbb{P}[R_1=k|R_2=j]\,\mathbb{P}[R_2=j] + \cdots +
\end{aligned}$$

donde para

$k=0$**:**

$$\begin{aligned}
\mathbb{P}[R_1=0] = \mathbb{P}[R_1=0|R_2=0]\,\mathbb{P}[R_2=0] + \mathbb{P}[R_1=0|R_2=1]\,\mathbb{P}[R_2=1] \\
+\mathbb{P}[R_1=0|R_2=j]\,\mathbb{P}[R_2=j] = \mathbb{P}[R_2=0].
\end{aligned}$$

$k=1$**:**

$$\begin{aligned}
\mathbb{P}[R_1=1] &= \mathbb{P}[R_1=1|R_2=0]\,\mathbb{P}[R_2=0] + \mathbb{P}[R_1=1|R_2=1]\,\mathbb{P}[R_2=1] \\
&+\mathbb{P}[R_1=1|R_2=1]\,\mathbb{P}[R_2=1] + \cdots + \mathbb{P}[R_1=1|R_2=j]\,\mathbb{P}[R_2=j] \\
&= \sum_{n=1}^{\infty}\mathbb{P}[R_2=n].
\end{aligned}$$

$k=2$**:**

$$\begin{aligned}
\mathbb{P}[R_1=2] &= \mathbb{P}[R_1=2|R_2=0]\,\mathbb{P}[R_2=0] + \mathbb{P}[R_1=2|R_2=1]\,\mathbb{P}[R_2=1] \\
&+\mathbb{P}[R_1=2|R_2=2]\,\mathbb{P}[R_2=2] + \cdots + \mathbb{P}[R_1=2|R_2=j]\,\mathbb{P}[R_2=j] \\
&= \sum_{n=2}^{\infty}\mathbb{P}[R_2=n].
\end{aligned}$$

En general

$$\begin{aligned}
\mathbb{P}[R_1=k] &= \mathbb{P}[R_1=k|R_2=0]\,\mathbb{P}[R_2=0] + \mathbb{P}[R_1=k|R_2=1]\,\mathbb{P}[R_2=1] \\
&+\mathbb{P}[R_1=k|R_2=2]\,\mathbb{P}[R_2=2] + \cdots + \mathbb{P}[R_1=k|R_2=k]\,\mathbb{P}[R_2=k] \\
&= \sum_{n=k}^{\infty}\mathbb{P}[R_2=n].
\end{aligned}$$

Por lo tanto

$$f_{R_1}(k) = \mathbb{P}[R_1=k] = \sum_{n=k}^{\infty}\mathbb{P}[R_2=n].$$

36.69. Descripción de una Red de S.V.C.

Se definen los procesos de llegada de los usuarios a cada una de las colas dependiendo de la llegada del servidor pero del sistema al cuál no pertenece la cola en cuestión:

Para el sistema 1 y el servidor del segundo sistema

$$
\begin{aligned}
F_{1,1}\left(z_1;\zeta_1\right) &= \mathbb{E}\left[z_1^{L_1(\zeta_1)}\right] = \sum_{k=0}^{\infty}\mathbb{P}\left[L_1\left(\zeta_1\right)=k\right]z_1^k \\
F_{2,1}\left(z_2;\zeta_1\right) &= \mathbb{E}\left[z_2^{L_2(\zeta_1)}\right] = \sum_{k=0}^{\infty}\mathbb{P}\left[L_2\left(\zeta_1\right)=k\right]z_2^k \\
F_{1,2}\left(z_1;\zeta_2\right) &= \mathbb{E}\left[z_1^{L_1(\zeta_2)}\right] = \sum_{k=0}^{\infty}\mathbb{P}\left[L_1\left(\zeta_2\right)=k\right]z_1^k \\
F_{2,2}\left(z_2;\zeta_2\right) &= \mathbb{E}\left[z_2^{L_2(\zeta_2)}\right] = \sum_{k=0}^{\infty}\mathbb{P}\left[L_2\left(\zeta_2\right)=k\right]z_2^k
\end{aligned}
$$

Ahora se definen para el segundo sistema y el servidor del primero

$$
\begin{aligned}
\hat{F}_{1,1}\left(w_1;\tau_1\right) &= \mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}\right] = \sum_{k=0}^{\infty}\mathbb{P}\left[\hat{L}_1\left(\tau_1\right)=k\right]w_1^k \\
\hat{F}_{2,1}\left(w_2;\tau_1\right) &= \mathbb{E}\left[w_2^{\hat{L}_2(\tau_1)}\right] = \sum_{k=0}^{\infty}\mathbb{P}\left[\hat{L}_2\left(\tau_1\right)=k\right]w_2^k \\
\hat{F}_{1,2}\left(w_1;\tau_2\right) &= \mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)}\right] = \sum_{k=0}^{\infty}\mathbb{P}\left[\hat{L}_1\left(\tau_2\right)=k\right]w_1^k \\
\hat{F}_{2,2}\left(w_2;\tau_2\right) &= \mathbb{E}\left[w_2^{\hat{L}_2(\tau_2)}\right] = \sum_{k=0}^{\infty}\mathbb{P}\left[\hat{L}_2\left(\tau_2\right)=k\right]w_2^k
\end{aligned}
$$

Ahora, con lo anterior definamos la FGP conjunta para el segundo sistema y τ_1:

$$
\begin{aligned}
\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right] &= \mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}\right]\mathbb{E}\left[w_2^{\hat{L}_2(\tau_1)}\right] = \hat{F}_{1,1}\left(w_1;\tau_1\right)\hat{F}_{2,1}\left(w_2;\tau_1\right) \\
&= \hat{F}_1\left(w_1,w_2;\tau_1\right).
\end{aligned}
$$

hagamos lo mismo para τ_2

$$
\begin{aligned}
\mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)}w_2^{\hat{L}_2(\tau_2)}\right] &= \mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)}\right]\mathbb{E}\left[w_2^{\hat{L}_2(\tau_2)}\right] = \hat{F}_{1,2}\left(w_1;\tau_2\right)\hat{F}_{2,2}\left(w_2;\tau_2\right) \\
&= \hat{F}_2\left(w_1,w_2;\tau_2\right).
\end{aligned}
$$

Con respecto al sistema 1 se tiene la FGP conjunta con respecto a ζ_1:

$$
\begin{aligned}
\mathbb{E}\left[z_1^{L_1(\zeta_1)}z_2^{L_2(\zeta_1)}\right] &= \mathbb{E}\left[z_1^{L_1(\zeta_1)}\right]\mathbb{E}\left[z_2^{L_2(\zeta_1)}\right] = F_{1,1}\left(z_1;\zeta_1\right)F_{2,1}\left(z_2;\zeta_1\right) \\
&= F_1\left(z_1,z_2;\zeta_1\right).
\end{aligned}
$$

Finalmente

$$
\begin{aligned}
\mathbb{E}\left[z_1^{L_1(\zeta_2)}z_2^{L_2(\zeta_2)}\right] &= \mathbb{E}\left[z_1^{L_1(\zeta_2)}\right]\mathbb{E}\left[z_2^{L_2(\zeta_2)}\right] = F_{1,2}\left(z_1;\zeta_2\right)F_{2,2}\left(z_2;\zeta_2\right) \\
&= F_2\left(z_1,z_2;\zeta_2\right).
\end{aligned}
$$

Ahora analicemos la Red de Sistemas de Visitas Cíclicas, entonces se define la PGF conjunta al tiempo t para los tiempos de visita del servidor en cada una de las colas, para comenzar a dar servicio, definidos anteriormente al tiempo $t=\{\tau_1,\tau_2,\zeta_1,\zeta_2\}$:

$$
F_1\left(z_1,z_2,w_1,w_2\right) = \mathbb{E}\left[z_1^{L_1(\tau_1)}z_2^{L_2(\tau_1)}w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right] \tag{36.69.1}
$$

$$
F_2\left(z_1,z_2,w_1,w_2\right) = \mathbb{E}\left[z_1^{L_1(\tau_2)}z_2^{L_2(\tau_2)}w_1^{\hat{L}_1(\tau_2)}w_2^{\hat{L}_2(\tau_2)}\right] \tag{36.69.2}
$$

$$
\hat{F}_1\left(z_1,z_2,w_1,w_2\right) = \mathbb{E}\left[z_1^{L_1(\zeta_1)}z_2^{L_2(\zeta_1)}w_1^{\hat{L}_1(\zeta_1)}w_2^{\hat{L}_2(\zeta_1)}\right] \tag{36.69.3}
$$

$$
\hat{F}_2\left(z_1,z_2,w_1,w_2\right) = \mathbb{E}\left[z_1^{L_1(\zeta_2)}z_2^{L_2(\zeta_2)}w_1^{\hat{L}_1(\zeta_2)}w_2^{\hat{L}_2(\zeta_2)}\right] \tag{36.69.4}
$$

Entonces, con la finalidad de encontrar el número de usuarios presentes en el sistema cuando el servidor deja de atender una de las colas de cualquier sistema se tiene lo siguiente

$$\begin{aligned}
& \mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)} z_2^{L_2(\overline{\tau}_1)} w_1^{\hat{L}_1(\overline{\tau}_1)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right] = \mathbb{E}\left[z_2^{L_2(\overline{\tau}_1)} w_1^{\hat{L}_1(\overline{\tau}_1)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right] \\
= \quad & \mathbb{E}\left[z_2^{L_2(\tau_1)+X_2(\overline{\tau}_1-\tau_1)+Y_2(\overline{\tau}_1-\tau_1)} w_1^{\hat{L}_1(\tau_1)+\hat{X}_1(\overline{\tau}_1-\tau_1)} w_2^{\hat{L}_2(\tau_1)+\hat{X}_2(\overline{\tau}_1-\tau_1)}\right]
\end{aligned}$$

utilizando la ecuacion dada (36.82.1), luego

$$\begin{aligned}
= \quad & \mathbb{E}\left[z_2^{L_2(\tau_1)} z_2^{X_2(\overline{\tau}_1-\tau_1)} z_2^{Y_2(\overline{\tau}_1-\tau_1)} w_1^{\hat{L}_1(\tau_1)} w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)} w_2^{\hat{L}_2(\tau_1)} w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right] \\
= \quad & \mathbb{E}\left[z_2^{L_2(\tau_1)} \left\{w_1^{\hat{L}_1(\tau_1)} w_2^{\hat{L}_2(\tau_1)}\right\} \left\{z_2^{X_2(\overline{\tau}_1-\tau_1)} z_2^{Y_2(\overline{\tau}_1-\tau_1)} w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)} w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right]
\end{aligned}$$

Aplicando la ecuación (36.81.1)

$$= \quad \mathbb{E}\left[z_2^{L_2(\tau_1)} \left\{z_2^{X_2(\overline{\tau}_1-\tau_1)} z_2^{Y_2(\overline{\tau}_1-\tau_1)} w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)} w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)} w_2^{\hat{L}_2(\tau_1)}\right]$$

dado que los arribos a cada una de las colas son independientes, podemos separar la esperanza para los procesos de llegada a Q_1 y Q_2 en τ_1

Recordando que $\tilde{X}_2(z_2) = X_2(z_2) + Y_2(z_2)$ se tiene

$$\begin{aligned}
= \quad & \mathbb{E}\left[z_2^{L_2(\tau_1)} \left\{z_2^{\tilde{X}_2(\overline{\tau}_1-\tau_1)} w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)} w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)} w_2^{\hat{L}_2(\tau_1)}\right] \\
= \quad & \mathbb{E}\left[z_2^{L_2(\tau_1)} \left\{\tilde{P}_2(z_2)^{\overline{\tau}_1-\tau_1} \hat{P}_1(w_1)^{\overline{\tau}_1-\tau_1} \hat{P}_2(w_2)^{\overline{\tau}_1-\tau_1}\right\}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)} w_2^{\hat{L}_2(\tau_1)}\right] \\
= \quad & \mathbb{E}\left[z_2^{L_2(\tau_1)} \left\{\tilde{P}_2(z_2) \hat{P}_1(w_1) \hat{P}_2(w_2)\right\}^{\overline{\tau}_1-\tau_1}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)} w_2^{\hat{L}_2(\tau_1)}\right]
\end{aligned}$$

Entonces

$$\begin{aligned}
= \quad & \mathbb{E}\left[z_2^{L_2(\tau_1)} \theta_1\left(\tilde{P}_2(z_2) \hat{P}_1(w_1) \hat{P}_2(w_2)\right)^{L_1(\tau_1)}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)} w_2^{\hat{L}_2(\tau_1)}\right] \\
= \quad & F_1\left(\theta_1\left(\tilde{P}_2(z_2) \hat{P}_1(w_1) \hat{P}_2(w_2)\right), z2\right) \hat{F}_1(w_1, w_2; \tau_1) \\
\equiv \quad & F_1\left(\theta_1\left(\tilde{P}_2(z_2) \hat{P}_1(w_1) \hat{P}_2(w_2)\right), z_2, w_1, w_2\right)
\end{aligned}$$

Las igualdades anteriores son ciertas pues el número de usuarios que llegan a $\hat{Q}_2$ durante el intervalo $[\tau_1, \overline{\tau}_1]$ aún no han sido atendidos por el servidor del sistema 2 y por tanto aún no pueden pasar al sistema 1 por Q_2. Por tanto el número de usuarios que pasan de $\hat{Q}_2$ a Q_2 en el intervalo de tiempo $[\tau_1, \overline{\tau}_1]$ depende de la política de traslado entre los dos sistemas, conforme a la sección anterior.

Por lo tanto

$$\mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)} z_2^{L_2(\overline{\tau}_1)} w_1^{\hat{L}_1(\overline{\tau}_1)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right] = F_1\left(\theta_1\left(\tilde{P}_2(z_2) \hat{P}_1(w_1) \hat{P}_2(w_2)\right), z_2, w_1, w_2\right) \tag{36.69.5}$$

Utilizando un razonamiento análogo para $\overline{\tau}_2$:

$$\begin{aligned}
& \mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)} z_2^{L_2(\overline{\tau}_2)} w_1^{\hat{L}_1(\overline{\tau}_2)} w_2^{\hat{L}_2(\overline{\tau}_2)}\right] = \mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)} w_1^{\hat{L}_1(\overline{\tau}_2)} w_2^{\hat{L}_2(\overline{\tau}_2)}\right] \\
= \quad & \mathbb{E}\left[z_1^{L_1(\tau_2)+X_1(\overline{\tau}_2-\tau_2)} w_1^{\hat{L}_1(\tau_2)+\hat{X}_1(\overline{\tau}_2-\tau_2)} w_2^{\hat{L}_2(\tau_2)+\hat{X}_2(\overline{\tau}_2-\tau_2)}\right] \\
= \quad & \mathbb{E}\left[z_1^{L_1(\tau_2)} z_1^{X_1(\overline{\tau}_2-\tau_2)} w_1^{\hat{L}_1(\tau_2)} w_1^{\hat{X}_1(\overline{\tau}_2-\tau_2)} w_2^{\hat{L}_2(\tau_2)} w_2^{\hat{X}_2(\overline{\tau}_2-\tau_2)}\right] \\
= \quad & \mathbb{E}\left[z_1^{L_1(\tau_2)} z_1^{X_1(\overline{\tau}_2-\tau_2)} w_1^{\hat{X}_1(\overline{\tau}_2-\tau_2)} w_2^{\hat{X}_2(\overline{\tau}_2-\tau_2)}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)} w_2^{\hat{L}_2(\tau_2)}\right] \\
= \quad & \mathbb{E}\left[z_1^{L_1(\tau_2)} P_1(z_1)^{\overline{\tau}_2-\tau_2} \hat{P}_1(w_1)^{\overline{\tau}_2-\tau_2} \hat{P}_2(w_2)^{\overline{\tau}_2-\tau_2}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)} w_2^{\hat{L}_2(\tau_2)}\right]
\end{aligned}$$

utlizando la proposición relacionada con la ruina del jugador

$$\begin{aligned}
= \quad & \mathbb{E}\left[z_1^{L_1(\tau_2)} \left\{P_1(z_1) \hat{P}_1(w_1) \hat{P}_2(w_2)\right\}^{\overline{\tau}_2-\tau_2}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)} w_2^{\hat{L}_2(\tau_2)}\right] \\
= \quad & \mathbb{E}\left[z_1^{L_1(\tau_2)} \tilde{\theta}_2\left(P_1(z_1) \hat{P}_1(w_1) \hat{P}_2(w_2)\right)^{L_2(\tau_2)}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)} w_2^{\hat{L}_2(\tau_2)}\right] \\
= \quad & F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1) \hat{P}_1(w_1) \hat{P}_2(w_2)\right)\right) \hat{F}_2(w_1, w_2; \tau_2)
\end{aligned}$$

entonces se define

$$\mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)} z_2^{L_2(\overline{\tau}_2)} w_1^{\hat{L}_1(\overline{\tau}_2)} w_2^{\hat{L}_2(\overline{\tau}_2)}\right] = F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\hat{P}_1(w_1)\hat{P}_2(w_2)\right), w_1, w_2\right) \tag{36.69.6}$$

$$\equiv F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)\right)\hat{F}_2(w_1, w_2; \tau_2) \tag{36.69.7}$$

Ahora para $\overline{\zeta}_1$:

$$\begin{aligned}
\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)} z_2^{L_2(\overline{\zeta}_1)} w_1^{\hat{L}_1(\overline{\zeta}_1)} w_2^{\hat{L}_2(\overline{\zeta}_1)}\right] &= \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)} z_2^{L_2(\overline{\zeta}_1)} w_2^{\hat{L}_2(\overline{\zeta}_1)}\right] \\
&= \mathbb{E}\left[z_1^{L_1(\zeta_1)} z_1^{X_1(\overline{\zeta}_1-\zeta_1)} z_2^{L_2(\zeta_1)} z_2^{X_2(\overline{\zeta}_1-\zeta_1)} z_2^{Y_2(\overline{\zeta}_1-\zeta_1)} w_2^{\hat{L}_2(\zeta_1)} w_2^{\hat{X}_2(\overline{\zeta}_1-\zeta_1)}\right] \\
&= \mathbb{E}\left[z_1^{L_1(\zeta_1)} z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[z_1^{X_1(\overline{\zeta}_1-\zeta_1)} z_2^{\tilde{X}_2(\overline{\zeta}_1-\zeta_1)} w_2^{\hat{X}_2(\overline{\zeta}_1-\zeta_1)} w_2^{\hat{L}_2(\zeta_1)}\right] \\
&= \mathbb{E}\left[z_1^{L_1(\zeta_1)} z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[P_1(z_1)^{\overline{\zeta}_1-\zeta_1}\tilde{P}_2(z_2)^{\overline{\zeta}_1-\zeta_1}\hat{P}_2(w_2)^{\overline{\zeta}_1-\zeta_1} w_2^{\hat{L}_2(\zeta_1)}\right] \\
&= \mathbb{E}\left[z_1^{L_1(\zeta_1)} z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[\left\{P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right\}^{\overline{\zeta}_1-\zeta_1} w_2^{\hat{L}_2(\zeta_1)}\right] \\
&= \mathbb{E}\left[z_1^{L_1(\zeta_1)} z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[\hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right)^{\hat{L}_1(\zeta_1)} w_2^{\hat{L}_2(\zeta_1)}\right] \\
&= F_1(z_1, z_2; \zeta_1)\hat{F}_1\left(\hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right), w_2\right)
\end{aligned}$$

es decir

$$\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)} z_2^{L_2(\overline{\zeta}_1)} w_1^{\hat{L}_1(\overline{\zeta}_1)} w_2^{\hat{L}_2(\overline{\zeta}_1)}\right] = \hat{F}_1\left(z_1, z_2, \hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right), w_2\right) \tag{3}$$

$$= F_1(z_1, z_2; \zeta_1)\hat{F}_1\left(\hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right)\right) \tag{3}$$

Finalmente para $\overline{\zeta}_2$:

$$\begin{aligned}
\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)} w_2^{\hat{L}_2(\overline{\zeta}_2)}\right] &= \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)}\right] \\
&= \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_1^{X_1(\overline{\zeta}_2-\zeta_2)} z_2^{L_2(\zeta_2)} z_2^{X_2(\overline{\zeta}_2-\zeta_2)} z_2^{Y_2(\overline{\zeta}_2-\zeta_2)} w_1^{\hat{L}_1(\zeta_2)} w_1^{\hat{X}_1(\overline{\zeta}_2-\zeta_2)}\right] \\
&= \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_2^{L_2(\zeta_2)}\right]\mathbb{E}\left[z_1^{X_1(\overline{\zeta}_2-\zeta_2)} z_2^{\tilde{X}_2(\overline{\zeta}_2-\zeta_2)} w_1^{\hat{X}_1(\overline{\zeta}_2-\zeta_2)} w_1^{\hat{L}_1(\zeta_2)}\right] \\
&= \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_2^{L_2(\zeta_2)}\right]\mathbb{E}\left[P_1(z_1)^{\overline{\zeta}_2-\zeta_2}\tilde{P}_2(z_2)^{\overline{\zeta}_2-\zeta_2}\hat{P}(w_1)^{\overline{\zeta}_2-\zeta_2} w_1^{\hat{L}_1(\zeta_2)}\right] \\
&= \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_2^{L_2(\zeta_2)}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\zeta_2)}\left\{P_1(z_1)\tilde{P}_2(z_2)\hat{P}(w_1)\right\}^{\overline{\zeta}_2-\zeta_2}\right] \\
&= \mathbb{E}\left[z_1^{L_1(\zeta_2)} z_2^{L_2(\zeta_2)}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\zeta_2)}\hat{\theta}_2\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}(w_1)\right)^{\hat{L}_2\zeta_2}\right] \\
&= F_2(z_1, z_2; \zeta_2)\hat{F}_2\left(w_1, \hat{\theta}_2\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\right)\right]
\end{aligned}$$

36.70. Ecuaciones Recursivas para la R.S.V.C.

es decir

$$\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)} w_2^{\hat{L}_2(\overline{\zeta}_2)}\right] = \hat{F}_2\left(z_1, z_2, w_1, \hat{\theta}_2\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\right)\right) \tag{36.70.1}$$

$$= F_2(z_1, z_2; \zeta_2)\hat{F}_2\left(w_1, \hat{\theta}_2\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\right)\right] \tag{36.70.2}$$

$$\tag{36.70.3}$$

Con lo desarrollado hasta ahora podemos encontrar las ecuaciones recursivas que modelan la Red de Sistemas de Visitas Cíclicas (R.S.V.C):

$$F_2(z_1, z_2, w_1, w_2) = R_1(z_1, z_2, w_1, w_2)\,\mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)} z_2^{L_2(\overline{\tau}_1)} w_1^{\hat{L}_1(\overline{\tau}_1)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right]$$

$$F_1(z_1, z_2, w_1, w_2) = R_2(z_1, z_2, w_1, w_2)\,\mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)} z_2^{L_2(\overline{\tau}_2)} w_1^{\hat{L}_1(\overline{\tau}_2)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right]$$

$$\hat{F}_2(z_1, z_2, w_1, w_2) = \hat{R}_1(z_1, z_2, w_1, w_2)\,\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)} z_2^{L_2(\overline{\zeta}_1)} w_1^{\hat{L}_1(\overline{\zeta}_1)} w_2^{\hat{L}_2(\overline{\zeta}_1)}\right]$$

y finalmente

$$\hat{F}_1(z_1,z_2,w_1,w_2)=\hat{R}_2(z_1,z_2,w_1,w_2)\,\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)}z_2^{L_2(\overline{\zeta}_2)}w_1^{\hat{L}_1(\overline{\zeta}_2)}w_2^{\hat{L}_2(\overline{\zeta}_2)}\right]$$

que son equivalentes a las siguientes ecuaciones

$$\begin{aligned}F_2(z_1,z_2,w_1,w_2) &= R_1\left(P_1(z_1)\,\tilde{P}_2(z_2)\prod_{i=1}^{2}\hat{P}_i(w_i)\right)\\ &\quad F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right),z_2,w_1,w_2\right)\end{aligned}$$

$$\begin{aligned}F_1(z_1,z_2,w_1,w_2) &= R_2\left(P_1(z_1)\,\tilde{P}_2(z_2)\prod_{i=1}^{2}\hat{P}_i(w_i)\right)\\ &\quad F_2\left(z_1,\tilde{\theta}_2\left(P_1(z_1)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right),w_1,w_2\right)\end{aligned}$$

36.70.1. Tiempos de Traslado del Servidor

$$\begin{aligned}\hat{F}_2(z_1,z_2,w_1,w_2) &= \hat{R}_1\left(P_1(z_1)\,\tilde{P}_2(z_2)\prod_{i=1}^{2}\hat{P}_i(w_i)\right)\\ &\quad \hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_2(w_2)\right),w_2\right)\end{aligned}$$

$$\begin{aligned}\hat{F}_1(z_1,z_2,w_1,w_2) &= \hat{R}_2\left(P_1(z_1)\,\tilde{P}_2(z_2)\prod_{i=1}^{2}\hat{P}_i(w_i)\right)\\ &\quad \hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\right)\right)\end{aligned}$$

Para

$$R_1(\mathbf{z},\mathbf{w})=R_1\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right) \tag{36.70.4}$$

se tiene que

$$\begin{aligned}\frac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= R_1^{(1)}(1)\,P_1^{(1)}(1)=r_1\mu_1,\\ \frac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= R_1^{(1)}(1)\,\tilde{P}_2^{(1)}(1)=r_1\tilde{\mu}_2,\\ \frac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= R_1^{(1)}(1)\,\hat{P}_1^{(1)}(1)=r_1\hat{\mu}_1,\\ \frac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= R_1^{(1)}(1)\,\hat{P}_2^{(1)}(1)=r_1\hat{\mu}_2,\end{aligned}$$

Análogamente se tiene

$$R_2(\mathbf{z},\mathbf{w})=R_2\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right) \tag{36.70.5}$$

$$\begin{aligned}\frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= R_2^{(1)}(1)\,P_1^{(1)}(1)=r_2\mu_1,\\ \frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= R_2^{(1)}(1)\,\tilde{P}_2^{(1)}(1)=r_2\tilde{\mu}_2,\\ \frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= R_2^{(1)}(1)\,\hat{P}_1^{(1)}(1)=r_2\hat{\mu}_1,\\ \frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= R_2^{(1)}(1)\,\hat{P}_2^{(1)}(1)=r_2\hat{\mu}_2,\end{aligned}$$

Para el segundo sistema:

$$\hat{R}_1(\mathbf{z},\mathbf{w}) = \hat{R}_1\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right) \tag{36.70.6}$$

$$\begin{aligned}
\frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{R}_1^{(1)}(1)\,P_1^{(1)}(1) = \hat{r}_1\mu_1,\\
\frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{R}_1^{(1)}(1)\,\tilde{P}_2^{(1)}(1) = \hat{r}_1\tilde{\mu}_2,\\
\frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{R}_1^{(1)}(1)\,\hat{P}_1^{(1)}(1) = \hat{r}_1\hat{\mu}_1,\\
\frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{R}_1^{(1)}(1)\,\hat{P}_2^{(1)}(1) = \hat{r}_1\hat{\mu}_2,
\end{aligned}$$

Finalmente

$$\hat{R}_2(\mathbf{z},\mathbf{w}) = \hat{R}_2\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right) \tag{36.70.7}$$

$$\begin{aligned}
\frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{R}_2^{(1)}(1)\,P_1^{(1)}(1) = \hat{r}_2\mu_1,\\
\frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{R}_2^{(1)}(1)\,\tilde{P}_2^{(1)}(1) = \hat{r}_2\tilde{\mu}_2,\\
\frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{R}_2^{(1)}(1)\,\hat{P}_1^{(1)}(1) = \hat{r}_2\hat{\mu}_1,\\
\frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{R}_2^{(1)}(1)\,\hat{P}_2^{(1)}(1) = \hat{r}_2\hat{\mu}_2.
\end{aligned}$$

36.70.2. Usuarios presentes en la cola

Hagamos lo correspondiente con las siguientes expresiones obtenidas en la sección anterior: Recordemos que

$$\begin{aligned}
F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right) &= F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z2\right)\\
&\quad \hat{F}_1(w_1, w_2; \tau_1)
\end{aligned}$$

entonces

$$\begin{aligned}
\frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= 0\\
\frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_1}{\partial z_1}\cdot\frac{\partial \theta_1}{\partial \tilde{P}_2}\cdot\frac{\partial \tilde{P}_2}{\partial z_2} + \frac{\partial F_1}{\partial z_2}\\
\frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_1}{\partial z_1}\cdot\frac{\partial \theta_1}{\partial \hat{P}_1}\cdot\frac{\partial \hat{P}_1}{\partial w_1} + \frac{\partial \hat{F}_1}{\partial w_1}\\
\frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_1}{\partial z_1}\cdot\frac{\partial \theta_1}{\partial \hat{P}_2}\cdot\frac{\partial \hat{P}_2}{\partial w_2} + \frac{\partial \hat{F}_1}{\partial w_2}
\end{aligned}$$

para τ_2:

$$\begin{aligned}
F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), w_1, w_2\right) &= F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right)\right)\\
&\quad \hat{F}_2(w_1, w_2; \tau_2)
\end{aligned}$$

al igual que antes

$$
\begin{aligned}
\frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_2}{\partial z_2}\cdot\frac{\partial\tilde{\theta}_2}{\partial P_1}\cdot\frac{\partial P_1}{\partial z_2}+\frac{\partial F_2}{\partial z_1}\\
\frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= 0\\
\frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_2}{\partial z_2}\cdot\frac{\partial\tilde{\theta}_2}{\partial \hat{P}_1}\cdot\frac{\partial \hat{P}_1}{\partial w_1}+\frac{\partial \hat{F}_2}{\partial w_1}\\
\frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_2}{\partial z_2}\cdot\frac{\partial\tilde{\theta}_2}{\partial \hat{P}_2}\cdot\frac{\partial \hat{P}_2}{\partial w_2}+\frac{\partial \hat{F}_2}{\partial w_2}
\end{aligned}
$$

Ahora para el segundo sistema

$$
\begin{aligned}
\hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right) &= F_1\left(z_1,z_2;\zeta_1\right)\\
&\quad \hat{F}_1\left(\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)
\end{aligned}
$$

entonces

$$
\begin{aligned}
\frac{\partial \hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{F}_1}{\partial w_1}\cdot\frac{\partial\hat{\theta}_1}{\partial P_1}\cdot\frac{\partial P_1}{\partial z_1}+\frac{\partial F_1}{\partial z_1}\\
\frac{\partial \hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{F}_1}{\partial w_1}\cdot\frac{\partial\hat{\theta}_1}{\partial \tilde{P}_2}\cdot\frac{\partial \tilde{P}_2}{\partial z_2}+\frac{\partial F_1}{\partial z_2}\\
\frac{\partial \hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= 0\\
\frac{\partial \hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{F}_1}{\partial w_1}\cdot\frac{\partial\hat{\theta}_1}{\partial \hat{P}_2}\cdot\frac{\partial \hat{P}_2}{\partial w_2}+\frac{\partial \hat{F}_1}{\partial w_2}
\end{aligned}
$$

Finalmente para ζ_2

$$
\begin{aligned}
\hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right) &= F_2\left(z_1,z_2;\zeta_2\right)\\
&\quad \hat{F}_2\left(w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right]
\end{aligned}
$$

por tanto:

$$
\begin{aligned}
\frac{\partial \hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{F}_2}{\partial w_2}\cdot\frac{\partial\hat{\theta}_2}{\partial P_1}\cdot\frac{\partial P_1}{\partial z_1}+\frac{\partial F_2}{\partial z_1}\\
\frac{\partial \hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{F}_2}{\partial w_2}\cdot\frac{\partial\hat{\theta}_2}{\partial \tilde{P}_2}\cdot\frac{\partial \tilde{P}_2}{\partial z_2}+\frac{\partial F_2}{\partial z_2}\\
\frac{\partial \hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{F}_2}{\partial w_2}\cdot\frac{\partial\hat{\theta}_2}{\partial \hat{P}_1}\cdot\frac{\partial \hat{P}_1}{\partial w_1}+\frac{\partial \hat{F}_2}{\partial w_1}\\
\frac{\partial \hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= 0
\end{aligned}
$$

36.70.3. Ecuaciones Recursivas

Entonces, de todo lo desarrollado hasta ahora se tienen las siguientes ecuaciones:

$$
\begin{aligned}
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial R_1}{\partial z_1}+\frac{\partial F_1}{\partial z_1}=r_1\mu_1\\
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial R_1}{\partial z_2}+\frac{\partial F_1}{\partial z_2}=r_1\tilde{\mu}_2+f_1(1)\left(\frac{1}{1-\mu_1}\right)\tilde{\mu}_2+f_1(2)\\
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial R_1}{\partial w_1}+\frac{\partial F_1}{\partial w_1}=r_1\hat{\mu}_1+f_1(1)\left(\frac{1}{1-\mu_1}\right)\hat{\mu}_1+\hat{F}_{1,1}^{(1)}(1)\\
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial R_1}{\partial w_2}+\frac{\partial F_1}{\partial w_2}=r_1\hat{\mu}_2+f_1(1)\left(\frac{1}{1-\mu_1}\right)\hat{\mu}_2+\hat{F}_{2,1}^{(1)}(1)
\end{aligned}
$$

$$
\begin{aligned}
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial R_2}{\partial z_1}+\frac{\partial F_2}{\partial z_1}=r_2\mu_1+f_2(2)\left(\frac{1}{1-\tilde{\mu}_2}\right)\mu_1+f_2(1)\\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial R_2}{\partial z_2}+\frac{\partial F_2}{\partial z_2}=r_2\tilde{\mu}_2\\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial R_2}{\partial w_1}+\frac{\partial F_2}{\partial w_1}=r_2\hat{\mu}_1+f_2(2)\left(\frac{1}{1-\tilde{\mu}_2}\right)\hat{\mu}_1+\hat{F}_{2,1}^{(1)}(1)\\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial R_2}{\partial w_2}+\frac{\partial F_2}{\partial w_2}=r_2\hat{\mu}_2+f_2(2)\left(\frac{1}{1-\tilde{\mu}_2}\right)\hat{\mu}_2+\hat{F}_{2,2}^{(1)}(1)
\end{aligned}
$$

$$
\begin{aligned}
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{R}_1}{\partial z_1}+\frac{\partial \hat{F}_1}{\partial z_1}=\hat{r}_1\mu_1+\hat{f}_1(1)\left(\frac{1}{1-\hat{\mu}_1}\right)\mu_1+F_{1,1}^{(1)}(1)\\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{R}_1}{\partial z_2}+\frac{\partial \hat{F}_1}{\partial z_2}=\hat{r}_1\mu_2+\hat{f}_1(1)\left(\frac{1}{1-\hat{\mu}_1}\right)\tilde{\mu}_2+F_{2,1}^{(1)}(1)\\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{R}_1}{\partial w_1}+\frac{\partial \hat{F}_1}{\partial w_1}=\hat{r}_1\hat{\mu}_1\\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{R}_1}{\partial w_2}+\frac{\partial \hat{F}_1}{\partial w_2}=\hat{r}_1\hat{\mu}_2+\hat{f}_1(1)\left(\frac{1}{1-\hat{\mu}_1}\right)\hat{\mu}_2+\hat{f}_1(2)
\end{aligned}
$$

$$
\begin{aligned}
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{R}_2}{\partial z_1}+\frac{\partial \hat{F}_2}{\partial z_1}=\hat{r}_2\mu_1+\hat{f}_2(1)\left(\frac{1}{1-\hat{\mu}_2}\right)\mu_1+F_{1,2}^{(1)}(1)\\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{R}_2}{\partial z_2}+\frac{\partial \hat{F}_2}{\partial z_2}=\hat{r}_2\tilde{\mu}_2+\hat{f}_2(2)\left(\frac{1}{1-\hat{\mu}_2}\right)\tilde{\mu}_2+F_{2,2}^{(1)}(1)\\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{R}_2}{\partial w_1}+\frac{\partial \hat{F}_2}{\partial w_1}=\hat{r}_2\hat{\mu}_1+\hat{f}_2(2)\left(\frac{1}{1-\hat{\mu}_2}\right)\hat{\mu}_1+\hat{f}_2(1)\\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{R}_2}{\partial w_2}+\frac{\partial \hat{F}_2}{\partial w_2}=\hat{r}_2\hat{\mu}_2
\end{aligned}
$$

Es decir, se tienen las siguientes ecuaciones:

$$
\begin{aligned}
f_2(1) &= r_1\mu_1\\
f_1(2) &= r_2\tilde{\mu}_2\\
f_2(2) &= r_1\tilde{\mu}_2+\tilde{\mu}_2\left(\frac{f_1(1)}{1-\mu_1}\right)+f_1(2)=\left(r_1+\frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2+r_2\tilde{\mu}_2\\
&= \left(r_1+r_2+\frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2=\left(r+\frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2\\
f_2(3) &= r_1\hat{\mu}_1+\hat{\mu}_1\left(\frac{f_1(1)}{1-\mu_1}\right)+\hat{F}_{1,1}^{(1)}(1)=\hat{\mu}_1\left(r_1+\frac{f_1(1)}{1-\mu_1}\right)+\frac{\hat{\mu}_1}{\mu_1}\\
f_2(4) &= r_1\hat{\mu}_2+\hat{\mu}_2\left(\frac{f_1(1)}{1-\mu_1}\right)+\hat{F}_{2,1}^{(1)}(1)=\hat{\mu}_2\left(r_1+\frac{f_1(1)}{1-\mu_1}\right)+\frac{\hat{\mu}_2}{\mu_1}
\end{aligned}
$$

$$
\begin{aligned}
f_1(1) &= r_2\mu_1 + \mu_1\left(\frac{f_2(2)}{1-\tilde{\mu}_2}\right) + r_1\mu_1 = \mu_1\left(r_1 + r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) \\
&= \mu_1\left(r + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) \\
f_1(3) &= r_2\hat{\mu}_1 + \hat{\mu}_1\left(\frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \hat{F}_{1,2}^{(1)}(1) = \hat{\mu}_1\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_1}{\mu_2} \\
f_1(4) &= r_2\hat{\mu}_2 + \hat{\mu}_2\left(\frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \hat{F}_{2,2}^{(1)}(1) = \hat{\mu}_2\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_2}{\mu_2} \\
\hat{f}_1(4) &= \hat{r}_2\hat{\mu}_2 \\
\hat{f}_2(3) &= \hat{r}_1\hat{\mu}_1 \\
\hat{f}_1(1) &= \hat{r}_2\mu_1 + \mu_1\left(\frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right) + F_{1,2}^{(1)}(1) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\mu_1 + \frac{\mu_1}{\hat{\mu}_2}
\end{aligned}
$$

$$
\begin{aligned}
\hat{f}_1(2) &= \hat{r}_2\tilde{\mu}_2 + \tilde{\mu}_2\left(\frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right) + F_{2,2}^{(1)}(1) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\tilde{\mu}_2 + \frac{\mu_2}{\hat{\mu}_2} \\
\hat{f}_1(3) &= \hat{r}_2\hat{\mu}_1 + \hat{\mu}_1\left(\frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right) + \hat{f}_2(3) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 + \hat{r}_1\hat{\mu}_1 \\
&= \left(\hat{r}_1 + \hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 = \left(\hat{r} + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 \\
\hat{f}_2(1) &= \hat{r}_1\mu_1 + \mu_1\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + F_{1,1}^{(1)}(1) = \left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\mu_1 + \frac{\mu_1}{\hat{\mu}_1} \\
\hat{f}_2(2) &= \hat{r}_1\tilde{\mu}_2 + \tilde{\mu}_2\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + F_{2,1}^{(1)}(1) = \left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\tilde{\mu}_2 + \frac{\mu_2}{\hat{\mu}_1} \\
\hat{f}_2(4) &= \hat{r}_1\hat{\mu}_2 + \hat{\mu}_2\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + \hat{f}_1(4) = \hat{r}_1\hat{\mu}_2 + \hat{r}_2\hat{\mu}_2 + \hat{\mu}_2\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) \\
&= \left(\hat{r} + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\hat{\mu}_2
\end{aligned}
$$

36.70.4. Solución del Sistema de Ecuaciones Lineales

A saber, se puede demostrar que la solución del sistema de ecuaciones está dado por las siguientes expresiones, donde

$$\mu = \mu_1 + \tilde{\mu}_2 \ , \ \hat{\mu} = \hat{\mu}_1 + \hat{\mu}_2 \ , \ r = r_1 + r_2 \text{ y } \hat{r} = \hat{r}_1 + \hat{r}_2$$

entonces

$$
\begin{aligned}
f_1(1) &= r\frac{\mu_1(1-\mu_1)}{1-\mu} \\
f_2(2) &= r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu}
\end{aligned}
$$

$$
\begin{aligned}
f_1(3) &= \hat{\mu}_1\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right) \\
f_1(4) &= \hat{\mu}_2\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right)
\end{aligned}
$$

$$
\begin{aligned}
f_2(3) &= \hat{\mu}_1\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right) \\
f_2(4) &= \hat{\mu}_2\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right)
\end{aligned}
$$

$$\begin{aligned}
\hat{f}_2(4) &= \hat{r}\frac{\hat{\mu}_2(1-\hat{\mu}_2)}{1-\hat{\mu}} \\
\hat{f}_1(3) &= \hat{r}\frac{\hat{\mu}_1(1-\hat{\mu}_1)}{1-\hat{\mu}}
\end{aligned}$$

$$\begin{aligned}
\hat{f}_1(1) &= \mu_1\left(\frac{\hat{r}_2\hat{\mu}_2+1}{\hat{\mu}_2}+\hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right) \\
\hat{f}_1(2) &= \tilde{\mu}_2\left(\hat{r}_2+\hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right)+\frac{\mu_2}{\hat{\mu}_2} \\
\hat{f}_2(1) &= \mu_1\left(\frac{\hat{r}_1\hat{\mu}_1+1}{\hat{\mu}_1}+\hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right) \\
\hat{f}_2(2) &= \tilde{\mu}_2\left(\hat{r}_1+\hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right)+\frac{\hat{\mu_2}}{\hat{\mu}_1}
\end{aligned}$$

A saber

$$\begin{aligned}
f_1(3) &= \hat{\mu}_1\left(r_2+\frac{f_2(2)}{1-\tilde{\mu}_2}\right)+\frac{\hat{\mu}_1}{\mu_2}=\hat{\mu}_1\left(r_2+\frac{r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu}}{1-\tilde{\mu}_2}\right)+\frac{\hat{\mu}_1}{\mu_2} \\

&= \tilde{\mu}_2\left(\hat{r}_1+\frac{\hat{r}\hat{\mu}_1}{1-\hat{\mu}}\right)+\frac{\mu_2}{\hat{\mu}_1}
\end{aligned}$$

36.71. Segundos Momentos

Para poder determinar los segundos momentos para los tiempos de traslado del servidor es necesario enunciar y demostrar la siguiente proposición:

Proposición 36.71.1 *Sea $f(g(x)h(y))$ función continua tal que tiene derivadas parciales mixtas de segundo orden, entonces se tiene lo siguiente:*

$$\frac{\partial}{\partial x}f(g(x)h(y))=\frac{\partial f(g(x)h(y))}{\partial x}\cdot\frac{\partial g(x)}{\partial x}\cdot h(y)$$

por tanto

$$\frac{\partial}{\partial x}\frac{\partial}{\partial x}f(g(x)h(y)) = \frac{\partial^2}{\partial x}f(g(x)h(y))\cdot\left(\frac{\partial g(x)}{\partial x}\right)^2\cdot h^2(y)+\frac{\partial}{\partial x}f(g(x)h(y))\cdot\frac{\partial g^2(x)}{\partial x^2}\cdot h(y) \quad (36.71.1)$$

y

$$\frac{\partial}{\partial y}\frac{\partial}{\partial x}f(g(x)h(y)) = \frac{\partial g(x)}{\partial x}\cdot\frac{\partial h(y)}{\partial y}\left\{\frac{\partial^2}{\partial y\partial x}f(g(x)h(y))\cdot g(x)\cdot h(y)+\frac{\partial}{\partial x}f(g(x)h(y))\right\}$$

Demostración 36.71.1

$$\begin{aligned}
\frac{\partial}{\partial x}\frac{\partial}{\partial x}f(g(x)h(y)) &= \frac{\partial}{\partial x}\left\{\frac{\partial f(g(x)h(y))}{\partial x}\cdot\frac{\partial g(x)}{\partial x}\cdot h(y)\right\}\\
&= \frac{\partial}{\partial x}\left\{\frac{\partial}{\partial x}f(g(x)h(y))\right\}\cdot\frac{\partial g(x)}{\partial x}\cdot h(y)+\frac{\partial}{\partial x}f(g(x)h(y))\cdot\frac{\partial g^2(x)}{\partial x^2}\cdot h(y)\\
&= \frac{\partial^2}{\partial x}f(g(x)h(y))\cdot\frac{\partial g(x)}{\partial x}\cdot h(y)\cdot\frac{\partial g(x)}{\partial x}\cdot h(y)+\frac{\partial}{\partial x}f(g(x)h(y))\cdot\frac{\partial g^2(x)}{\partial x^2}\cdot h(y)\\
&= \frac{\partial^2}{\partial x}f(g(x)h(y))\cdot\left(\frac{\partial g(x)}{\partial x}\right)^2\cdot h^2(y)+\frac{\partial}{\partial x}f(g(x)h(y))\cdot\frac{\partial g^2(x)}{\partial x^2}\cdot h(y).
\end{aligned}$$

Por otra parte:

$$\begin{aligned}
\frac{\partial}{\partial y}\frac{\partial}{\partial x}f(g(x)h(y)) &= \frac{\partial}{\partial y}\left\{\frac{\partial f(g(x)h(y))}{\partial x}\cdot\frac{\partial g(x)}{\partial x}\cdot h(y)\right\}\\
&= \frac{\partial}{\partial y}\left\{\frac{\partial}{\partial x}f(g(x)h(y))\right\}\cdot\frac{\partial g(x)}{\partial x}\cdot h(y)+\frac{\partial}{\partial x}f(g(x)h(y))\cdot\frac{\partial g(x)}{\partial x}\cdot\frac{\partial h(y)}{y}\\
&= \frac{\partial^2}{\partial y\partial x}f(g(x)h(y))\cdot\frac{\partial h(y)}{\partial y}\cdot g(x)\cdot\frac{\partial g(x)}{\partial x}\cdot h(y)+\frac{\partial}{\partial x}f(g(x)h(y))\cdot\frac{\partial g(x)}{\partial x}\cdot\frac{\partial h(y)}{\partial y}\\
&= \frac{\partial g(x)}{\partial x}\cdot\frac{\partial h(y)}{\partial y}\left\{\frac{\partial^2}{\partial y\partial x}f(g(x)h(y))\cdot g(x)\cdot h(y)+\frac{\partial}{\partial x}f(g(x)h(y))\right\}
\end{aligned}$$

Para la siguiente proposición es necesario utilizar el resultado (36.85.1)

Proposición 36.71.2 *Sea R_i la Función Generadora de Probabilidades para el número de arribos a cada una de las colas de la Red de Sistemas de Visitas Cíclicas definidas como en (36.84.4). Entonces las derivadas parciales están dadas por las siguientes expresiones:*

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_i^2} &= \left(\frac{\partial P_i(z_i)}{\partial z_i}\right)^2 \cdot \frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial^2 z_i} \\ &+ \left(\frac{\partial P_i(z_i)}{\partial z_i}\right)^2 \cdot \frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_i}\end{aligned}$$

y además

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_2\partial z_1} &= \frac{\partial \tilde{P}_2(z_2)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_2\partial z_1} \\ &+ \frac{\partial \tilde{P}_2(z_2)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_1},\end{aligned}$$

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_1} &= \frac{\partial \hat{P}_i(w_i)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_1} \\ &+ \frac{\partial \hat{P}_i(w_i)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_1},\end{aligned}$$

finalmente

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_2} &= \frac{\partial \hat{P}_i(w_i)}{\partial w_i}\cdot\frac{\partial \tilde{P}_2(z_2)}{\partial z_2}\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_2} \\ &+ \frac{\partial \hat{P}_i(w_i)}{\partial w_i}\cdot\frac{\partial \tilde{P}_2(z_2)}{\partial z_1}\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_2},\end{aligned}$$

para $i = 1, 2$.

36.71.1. Sistema de Ecuaciones Lineales para los Segundos Momentos

En el apéndice A se demuestra que las ecuaciones para las ecuaciones parciales mixtas están dadas por:

1.
$$\begin{aligned}f_1(1,1) &= r_2 P_1^{(2)}(1) + \mu_1^2 R_2^{(2)}(1) + 2\mu_1 r_2\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2) + f_2(1)\right) + \frac{1}{1-\tilde{\mu}_2}P_1^{(2)}f_2(2) \\ &+ \mu_1^2\tilde{\theta}_2^{(2)}(1)f_2(2) + \frac{\mu_1}{1-\tilde{\mu}_2}f_2(1,2) + \frac{\mu_1}{1-\tilde{\mu}_2}\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2,2) + f_2(1,2)\right) + f_2(1,1).\end{aligned}$$

2.
$$f_1(2,1) = \mu_1 r_2\tilde{\mu}_2 + \mu_1\tilde{\mu}_2 R_2^{(2)}(1) + r_2\tilde{\mu}_2\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2) + f_2(1)\right).$$

3.
$$\begin{aligned}f_1(3,1) &= \mu_1\hat{\mu}_1 r_2 + \mu_1\hat{\mu}_1 R_2^{(2)}(1) + r_2\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2) + r_2\hat{\mu}_1\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2) + f_2(1)\right) + \mu_1 r_2\hat{F}_{2,1}^{(1)}(1) \\ &+ \left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2) + f_2(1)\right)\hat{F}_{2,1}^{(1)}(1) + \frac{\mu_1\hat{\mu}_1}{1-\tilde{\mu}_2}f_2(2) + \mu_1\hat{\mu}_1\tilde{\theta}_2^{(2)}(1)f_2(2) \\ &+ \mu_1\hat{\mu}_1\left(\frac{1}{1-\tilde{\mu}_2}\right)^2 f_2(2,2) + \frac{\hat{\mu}_1}{1-\tilde{\mu}_2}f_2(1,2).\end{aligned}$$

4.

&+ \frac{1}{1-\hat{\mu}_1}\hat{P}_2^{(2)}(1)\hat{f}_1(1) + \hat{\mu}_2^2\hat{\theta}_1^{(2)}(1)\hat{f}_1(1) + \frac{\hat{\mu}_2}{1-\hat{\mu}_1}\hat{f}_1(1,2) \\
&+ \frac{\hat{\mu}_2}{1-\hat{\mu}_1}\left(\hat{f}_1(1,2) + \frac{\hat{\mu}_2}{1-\hat{\mu}_1}\hat{f}_1(1,1)\right).
\end{aligned}$$

36.72. Tiempos de Ciclo e Intervisita

Definición 36.72.1 *Sea L_i^* el número de usuarios en la cola Q_i cuando es visitada por el servidor para dar servicio, entonces*

$$\mathbb{E}[L_i^*] = f_i(i) \tag{36.72.1}$$

$$Var[L_i^*] = f_i(i,i) + \mathbb{E}[L_i^*] - \mathbb{E}[L_i^*]^2. \tag{36.72.2}$$

Definición 36.72.2 *El tiempo de Ciclo C_i es e periodo de tiempo que comienza cuando la cola i es visitada por primera vez en un ciclo, y termina cuando es visitado nuevamente en el próximo ciclo. La duración del mismo está dada por $\tau_i(m+1) - \tau_i(m)$, o equivalentemente $\overline{\tau}_i(m+1) - \overline{\tau}_i(m)$ bajo condiciones de estabilidad.*

Definición 36.72.3 *El tiempo de intervisita I_i es el periodo de tiempo que comienza cuando se ha completado el servicio en un ciclo y termina cuando es visitada nuevamente en el próximo ciclo. Su duración del mismo está dada por $\tau_i(m+1) - \overline{\tau}_i(m)$.*

Recordemos las siguientes expresiones:

$$\begin{aligned}
S_i(z) &= \mathbb{E}\left[z^{\overline{\tau}_i(m)-\tau_i(m)}\right] = F_i(\theta(z)), \\
F(z) &= \mathbb{E}\left[z^{L_0}\right], \\
P(z) &= \mathbb{E}\left[z^{X_n}\right], \\
F_i(z) &= \mathbb{E}\left[z^{L_i(\tau_i(m))}\right], \theta_i(z) - zP_i
\end{aligned}$$

entonces

$$\begin{aligned}
\mathbb{E}[S_i] &= \frac{\mathbb{E}[L_i^*]}{1-\mu_i} = \frac{f_i(i)}{1-\mu_i}, \\
Var[S_i] &= \frac{Var[L_i^*]}{(1-\mu_i)^2} + \frac{\sigma^2\mathbb{E}[L_i^*]}{(1-\mu_i)^3}
\end{aligned}$$

donde recordemos que

$$Var[L_i^*] = f_i(i,i) + f_i(i) - f_i(i)^2.$$

La duración del tiempo de intervisita es $\tau_i(m+1) - \overline{\tau}(m)$. Dado que el número de usuarios presentes en Q_i al tiempo $t = \tau_i(m+1)$ es igual al número de arribos durante el intervalo de tiempo $[\overline{\tau}(m), \tau_i(m+1)]$ se tiene que

$$\mathbb{E}\left[z_i^{L_i(\tau_i(m+1))}\right] = \mathbb{E}\left[\{P_i(z_i)\}^{\tau_i(m+1)-\overline{\tau}(m)}\right]$$

entonces, si

$$I_i(z) = \mathbb{E}\left[z^{\tau_i(m+1)-\overline{\tau}(m)}\right]$$

se tienen que

$$F_i(z) = I_i[P_i(z)]$$

para $i = 1, 2$, por tanto

$$\begin{aligned} \mathbb{E}[L_i^*] &= \mu_i \mathbb{E}[I_i] \\ Var[L_i^*] &= \mu_i^2 Var[I_i] + \sigma^2 \mathbb{E}[I_i] \end{aligned}$$

para $i = 1, 2$, por tanto

$$\mathbb{E}[I_i] = \frac{f_i(i)}{\mu_i},$$

además

$$Var[I_i] = \frac{Var[L_i^*]}{\mu_i^2} - \frac{\sigma_i^2}{\mu_i^2} f_i(i).$$

Si $C_i(z) = \mathbb{E}\left[z^{\overline{\tau}(m+1)-\overline{\tau}_i(m)}\right]$el tiempo de duración del ciclo, entonces, por lo hasta ahora establecido, se tiene que

$$C_i(z) = I_i[\theta_i(z)],$$

entonces

$$\begin{aligned} \mathbb{E}[C_i] &= \mathbb{E}[I_i]\,\mathbb{E}[\theta_i(z)] = \frac{\mathbb{E}[L_i^*]}{\mu_i}\frac{1}{1-\mu_i} = \frac{f_i(i)}{\mu_i(1-\mu_i)} \\ Var[C_i] &= \frac{Var[L_i^*]}{\mu_i^2(1-\mu_i)^2}. \end{aligned}$$

Por tanto se tienen las siguientes igualdades

$$\begin{aligned} \mathbb{E}[S_i] &= \mu_i \mathbb{E}[C_i], \\ \mathbb{E}[I_i] &= (1-\mu_i)\,\mathbb{E}[C_i] \end{aligned}$$

Defínanse los puntos de regenaración en el proceso $[L_1(t), L_2(t), \ldots, L_N(t)]$. Los puntos cuando la cola i es visitada y todos los $L_j(\tau_i(m)) = 0$ para $i = 1, 2$ son puntos de regeneración. Se llama ciclo regenerativo al intervalo entre dos puntos regenerativos sucesivos.

Sea M_i el número de ciclos de visita en un ciclo regenerativo, y sea $C_i^{(m)}$, para $m = 1, 2, \ldots, M_i$ la duración del m-ésimo ciclo de visita en un ciclo regenerativo. Se define el ciclo del tiempo de visita promedio $\mathbb{E}[C_i]$ como

$$\mathbb{E}[C_i] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right]}{\mathbb{E}[M_i]}$$

En Stid72 y Heym82 se muestra que una condición suficiente para que el proceso regenerativo estacionario sea un procesoo estacionario es que el valor esperado del tiempo del ciclo regenerativo sea finito:

$$\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right] < \infty.$$

como cada $C_i^{(m)}$ contiene intervalos de réplica positivos, se tiene que $\mathbb{E}[M_i] < \infty$, además, como $M_i > 0$, se tiene que la condición anterior es equivalente a tener que

$$\mathbb{E}\left[C_i\right] < \infty,$$

por lo tanto una condición suficiente para la existencia del proceso regenerativo está dada por

$$\sum_{k=1}^{N} \mu_k < 1.$$

Sea la función generadora de momentos para L_i, el número de usuarios en la cola $Q_i(z)$ en cualquier momento, está dada por el tiempo promedio de $z^{L_i(t)}$ sobre el ciclo regenerativo definido anteriormente:

$$Q_i(z) = \mathbb{E}\left[z^{L_i(t)}\right] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i}\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}\left[\sum_{m=1}^{M_i}\tau_i(m+1)-\tau_i(m)\right]}$$

M_i es un tiempo de paro en el proceso regenerativo con $\mathbb{E}\left[M_i\right] < \infty$, se sigue del lema de Wald que:

$$\begin{aligned}
\mathbb{E}\left[\sum_{m=1}^{M_i}\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}\left[M_i\right]\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] \\
\mathbb{E}\left[\sum_{m=1}^{M_i}\tau_i(m+1)-\tau_i(m)\right] &= \mathbb{E}\left[M_i\right]\mathbb{E}\left[\tau_i(m+1)-\tau_i(m)\right]
\end{aligned}$$

por tanto se tiene que

$$Q_i(z) = \frac{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}\left[\tau_i(m+1)-\tau_i(m)\right]}$$

observar que el denominador es simplemente la duración promedio del tiempo del ciclo.

Se puede demostrar (ver Hideaki Takagi 1986) que

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = z\frac{F_i(z)-1}{z-P_i(z)}$$

Durante el tiempo de intervisita para la cola i, $L_i(t)$ solamente se incrementa de manera que el incremento por intervalo de tiempo está dado por la función generadora de probabilidades de $P_i(z)$, por tanto la suma sobre el tiempo de intervisita puede evaluarse como:

$$\begin{aligned}
\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} \left\{P_i(z)\right\}^{t-\overline{\tau}_i(m)}\right] = \frac{1-\mathbb{E}\left[\left\{P_i(z)\right\}^{\tau_i(m+1)-\overline{\tau}_i(m)}\right]}{1-P_i(z)} \\
&= \frac{1-I_i\left[P_i(z)\right]}{1-P_i(z)}
\end{aligned}$$

por tanto

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = \frac{1-F_i(z)}{1-P_i(z)}$$

Haciendo uso de lo hasta ahora desarrollado se tiene que

$$\begin{aligned}
Q_i(z) &= \frac{1}{\mathbb{E}\left[C_i\right]}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)} \\
&= \frac{\mu_i(1-\mu_i)}{f_i(i)}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)}
\end{aligned}$$

derivando con respecto a z

$$\begin{aligned}
\frac{dQ_i(z)}{dz} &= \frac{(1-F_i(z))P_i(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\
&- \frac{(1-z)P_i(z)F_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\
&- \frac{(1-z)(1-F_i(z))P_i(z)\left(P_i^{'}(z)-1\right)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)^2} \\
&+ \frac{(1-z)(1-F_i(z))P_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\
&+ \frac{(1-z)(1-F_i(z))P_i(z)P_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))^2(P_i(z)-z)}
\end{aligned}$$

Calculando el límite cuando $z \to 1^+$:

$$Q_i^{(1)}(z) = \lim_{z\to 1^+}\frac{dQ_i(z)}{dz} = \lim_{z\to 1}\frac{(1-F_i(z))P_i(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \tag{36.72.3}$$

$$- \lim_{z\to 1^+}\frac{(1-z)P_i(z)F_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \tag{36.72.4}$$

$$- \lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i(z)\left(P_i^{'}(z)-1\right)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)^2} \tag{36.72.5}$$

$$+ \lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \tag{36.72.6}$$

$$+ \lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i(z)P_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))^2(P_i(z)-z)} \tag{36.72.7}$$

Entonces:

$$\begin{aligned}
\lim_{z\to 1^+}\frac{(1-F_i(z))P_i(z)}{(1-P_i(z))(P_i(z)-z)} &= \lim_{z\to 1^+}\frac{\frac{d}{dz}[(1-F_i(z))P_i(z)]}{\frac{d}{dz}[(1-P_i(z))(-z+P_i(z))]} \\
&= \lim_{z\to 1^+}\frac{-P_i(z)F_i^{'}(z)+(1-F_i(z))P_i^{'}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))P_i^{'}(z)}
\end{aligned}$$

$$\begin{aligned}
\lim_{z\to 1^+}\frac{(1-z)P_i(z)F_i^{'}(z)}{(1-P_i(z))(P_i(z)-z)} &= \lim_{z\to 1^+}\frac{\frac{d}{dz}\left[(1-z)P_i(z)F_i^{'}(z)\right]}{\frac{d}{dz}[(1-P_i(z))(P_i(z)-z)]} \\
&= \lim_{z\to 1^+}\frac{-P_i(z)F_i^{'}(z)+(1-z)F_i^{'}(z)P_i^{'}(z)+(1-z)P_i(z)F_i^{''}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))P_i^{'}(z)}
\end{aligned}$$

$$\lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i(z)\left(P_i^{'}(z)-1\right)}{(1-P_i(z))(P_i(z)-z)^2} = \lim_{z\to 1^+}\frac{\frac{d}{dz}\left[(1-z)(1-F_i(z))P_i(z)\left(P_i^{'}(z)-1\right)\right]}{\frac{d}{dz}\left[(1-P_i(z))(P_i(z)-z)^2\right]}$$

$$\begin{aligned}
= &\lim_{z\to 1^+}\frac{-(1-F_i(z))P_i(z)\left(-1+P_i^{'}(z)\right)-(1-z)P_i(z)F_i^{'}(z)\left(-1+P_i^{'}(z)\right)}{2(1-P_i(z))(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2P_i^{'}(z)} \\
+ &\lim_{z\to 1^+}\frac{+(1-z)(1-F_i(z))\left(-1+P_i^{'}(z)\right)P_i^{'}(z)}{2(1-P_i(z))(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2P_i^{'}(z)} \\
+ &\lim_{z\to 1^+}\frac{+(1-z)(1-F_i(z))P_i(z)P_i^{''}(z)}{2(1-P_i(z))(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2P_i^{'}(z)}
\end{aligned}$$

$$\lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i^{'}(z)}{(1-P_i(z))(P_i(z)-z)} = \lim_{z\to 1^+}\frac{\frac{d}{dz}\left[(1-z)(1-F_i(z))P_i^{'}(z)\right]}{\frac{d}{dz}[(1-P_i(z))(P_i(z)-z)]}$$

$$= \lim_{z\to 1^+}\frac{-(1-F_i(z))P_i^{'}(z)-(1-z)F_i^{'}(z)P_i^{'}(z)+(1-z)(1-F_i(z))P_i^{''}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))P_i^{'}(z)}$$

$$\begin{aligned}
&\lim_{z\to 1^+} \frac{(1-z)(1-F_i(z))P_i(z)P_i'(z)}{(1-P_i(z))^2(P_i(z)-z)} = \lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)(1-F_i(z))P_i(z)P_i'(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))^2(P_i(z)-z)\right]} \\
= &\lim_{z\to 1^+} \frac{-(1-F_i(z))P_i(z)P_i'(z)-(1-z)P_i(z)F_i'(z)P_i'[z]}{(1-P_i(z))^2\left(-1+P_i'(z)\right)-2(1-P_i(z))(-z+P_i(z))P_i'(z)} \\
+ &\lim_{z\to 1^+} \frac{(1-z)(1-F_i(z))P_i'(z)^2+(1-z)(1-F_i(z))P_i(z)P_i''(z)}{(1-P_i(z))^2\left(-1+P_i'(z)\right)-2(1-P_i(z))(-z+P_i(z))P_i'(z)}
\end{aligned}$$

36.72.1. Longitudes de la Cola en cualquier tiempo

Sea $V_i(z) = \frac{1}{\mathbb{E}[C_i]}\frac{I_i(z)-1}{z-P_i(z)}$

$$\frac{\partial V_i(z)}{\partial z} = \frac{1}{\mathbb{E}[C_i]}\left[\frac{I_i'(z)(z-P_i(z))}{z-P_i(z)} - \frac{(I_i(z)-1)(1-P_i'(z))}{(z-P_i(z))^2}\right]$$

La FGP para el tiempo de espera para cualquier usuario en la cola está dada por:

$$U_i(z) = \frac{1}{\mathbb{E}[C_i]}\cdot\frac{1-P_i(z)}{z-P_i(z)}\cdot\frac{I_i(z)-1}{1-z}$$

entonces

$$\begin{aligned}
\frac{d}{dz}V_i(z) &= \frac{1}{\mathbb{E}[C_i]}\left\{\frac{d}{dz}\left(\frac{1-P_i(z)}{z-P_i(z)}\right)\frac{I_i(z)-1}{1-z} + \frac{1-P_i(z)}{z-P_i(z)}\frac{d}{dz}\left(\frac{I_i(z)-1}{1-z}\right)\right\} \\
&= \frac{1}{\mathbb{E}[C_i]}\left\{\frac{-P_i(z)(z-P_i(z))-(1-P_i(z))\left(1-P_i'(z)\right)}{(z-P_i(z))^2}\cdot\frac{I_i(z)-1}{1-z}\right\} \\
&+ \frac{1}{\mathbb{E}[C_i]}\left\{\frac{1-P_i(z)}{z-P_i(z)}\cdot\frac{I_i'(z)(1-z)+(I_i(z)-1)}{(1-z)^2}\right\}
\end{aligned}$$

$$\begin{aligned}
\frac{\partial U_i(z)}{\partial z} &= \frac{(-1+I_i[z])(1-P_i[z])}{(1-z)^2\mathbb{E}[I_i](z-P_i[z])} + \frac{(1-P_i[z])I_i'[z]}{(1-z)\mathbb{E}[I_i](z-P_i[z])} - \frac{(-1+I_i[z])(1-P_i[z])(1-P'[z])}{(1-z)\mathbb{E}[I_i](z-P_i[z])^2} \\
&- \frac{(-1+I_i[z])P_i'[z]}{(1-z)\mathbb{E}[I_i](z-P_i[z])}
\end{aligned}$$

36.73. Procesos de Renovación y Regenerativos

Definición 36.73.1 *Sean $0 \le T_1 \le T_2 \le \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0,t)$ es*

$$N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \le t), \tag{36.73.1}$$

para $t \ge 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \ge 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 36.73.2 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \ge 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0,t)$*

Nota 36.73.1 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^{n} \xi_k$ y $N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \le t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes Números.*

36.73.1. Propiedades de los Procesos de Renovación

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq & \quad t \quad < T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 36.73.1 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Nota 36.73.2 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 36.73.1 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{36.73.2}$$

$$lim_{t\to\infty} t^{-1} N(t) = 1/\mu, \ c.s. \tag{36.73.3}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 36.73.1 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1} N(t) \to 1/\mu, \ c.s. \ cuando \ t \to \infty. \tag{36.73.4}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 36.73.3 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 36.73.2 *Supóngase que $n^{-1} T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \ c.s. \tag{36.73.5}$$

$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \ c.s. \tag{36.73.6}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 36.73.2 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \ c.s. \ cuando \ t \to \infty. \tag{36.73.7}$$

36.73.2. Función de Renovación

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 36.73.4 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t) = \sum_{n=1}^{\infty} F^{n\star}(t), \ t \geq 0,$$

donde $F^{0\star}(t) = \mathbb{1}(t \geq 0)$.

Proposición 36.73.2 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t > 0$, y es $U^{'}(t) = \sum_{n=0}^{\infty} f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t) > N(t-)\} = 0, \ t \geq 0.$$

Definición 36.73.5 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha) = \int_{\mathbb{R}_+} e^{-\alpha t} dF(t), \ \alpha \geq 0.$$

Entonces

$$\hat{U}(\alpha) = \sum_{n=0}^{\infty} \hat{F^{n\star}}(\alpha) = \sum_{n=0}^{\infty} \hat{F}(\alpha)^n = \frac{1}{1-\hat{F}(\alpha)}.$$

Proposición 36.73.3 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha) = \frac{1}{1-\hat{F}(\alpha)}$.*

Nota 36.73.3 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)] = \lambda t$, para $t \geq 0$.*

Teorema 36.73.3 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t) = \mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f : \mathbb{R}_+ \to \mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()} f(T_n)\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista. Además si $X_1, X_2, \ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n | T_n = s] = f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)} X_n\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista.

Corolario 36.73.3 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right] = \mu \mathbb{E}[N(t)+1], \ t \geq 0,$$

Definición 36.73.6 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t < 0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t) = h(t) + \int_{[0,t]} H(t-s)\, dF(s), \ t \geq 0, \tag{36.73.8}$$

donde $H(t)$ es una función de valores reales. Esto es $H = h + F \star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t < 0$.

Proposición 36.73.4 *La función $U \star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 36.73.4 (Teorema Renovación Elemental)

$$t^{-1}U(t) \to 1/\mu, \text{ cuando } t \to \infty.$$

36.73.3. Teorema Principal de Renovación

Nota 36.73.4 *Una función $h : \mathbb{R}_+ \to \mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ es decreciente y Riemann Integrable.

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)| \leq b(t)$, donde b es DRI.

Teorema 36.73.5 (Teorema Principal de Renovación) *Si F es no aritmética y $h(t)$ es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty} U \star h = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\, ds.$$

Proposición 36.73.5 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t < 0$ puede expresarse como*

$$H(t) = U \star h(t)\,,\ \textit{donde}\ h(t) = H(t) - F \star H(t)$$

Definición 36.73.7 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}[X(T+t)\,|T] = \mathbb{E}[X(t)]\,,\ \textit{para}\ t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 36.73.6 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}[X(t)] = U \star h(t)\,,\ \textit{donde}\ h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T > t)]\,.$$

Teorema 36.73.6 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M = \sup\{|X(t)| : t \leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}[X(t)] = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\, ds,$$

donde $h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T > t)]$.

36.73.4. Procesos Regenerativos

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Definición 36.73.8 *Para el proceso $\{(N(t), X(t)) : t \geq 0\}$, sus trayectoria muestrales en el intervalo de tiempo $[T_{n-1}, T_n)$ están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1} + t) : 0 \leq t < \xi_n\})$$

Este ζ_n es el n-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos T_n si sus segmentos ζ_n son independientes e idénticamennte distribuidos.

Observación 36.73.1 *Si $\tilde{X}(t)$ con espacio de estados $\tilde{S}$ es regenerativo sobre T_n, entonces $X(t) = f\left(\tilde{X}(t)\right)$ también es regenerativo sobre T_n, para cualquier función $f : \tilde{S} \to S$.*

Observación 36.73.2 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Definición 36.73.9 (Definición Clásica) *Un proceso estocástico $X = \{X(t) : t \geq 0\}$ es llamado regenerativo is existe una variable aleatoria $R_1 > 0$ tal que*

i) $\{X(t + R_1) : t \geq 0\}$ es independiente de $\{\{X(t) : t < R_1\},\}$

ii) $\{X(t + R_1) : t \geq 0\}$ es estocásticamente equivalente a $\{X(t) : t > 0\}$

Llamamos a R_1 tiempo de regeneración, y decimos que X se regenera en este punto.

$\{X(t+R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Nota 36.73.5 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Definición 36.73.10 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty X(u)\,du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty I_x(u)\,du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\,dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 36.73.6 *a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.*

b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

36.73.5. Procesos Regenerativos Estacionarios

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\left\{V(t-s) \in A | X_1 > t-s\right\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones que ocurren en $[0,t]$.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 36.73.11 *Se define el proceso estacionario, $\{V^*(t), t \geq 0\}$, para $\{V(t), t \geq 0\}$ por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]}\int_0^\infty \mathbb{P}\{V(t+x) \in A | X > x\}(1 - F(x))\,dx,$$

para todo $t \geq 0$ y todo conjunto de Borel A.

Definición 36.73.12 *Una modificación medible de un proceso $\{V(t), t \geq 0\}$, es una versión de este, $\{V(t,w)\}$ conjuntamente medible para $t \geq 0$ y para $w \in S$, S espacio de estados para $\{V(t), t \geq 0\}$.*

Teorema 36.73.7 *Sea $\{V(t), t \geq\}$ un proceso regenerativo no negativo con modificación medible. Sea $\mathbb{E}[X] < \infty$. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de t, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$, equivalentemente, si $\mathbb{E}\left[\int_0^X V(s)\,ds\right] < \infty$,entonces

$$\frac{\int_0^t V(s)\,ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$.

36.74. Tiempo de Ciclo Promedio

Consideremos una cola de la red de sistemas de visitas cíclicas fija, Q_l.

Conforme a la definición dada al principio del capítulo, definición (37.8.1), sean $T_1, T_2, \ldots$ los puntos donde las longitudes de las colas de la red de sistemas de visitas cíclicas son cero simultáneamente, cuando la cola Q_l es visitada por el servidor para dar servicio, es decir, $L_1(T_i) = 0, L_2(T_i) = 0, \hat{L}_1(T_i) = 0$ y $\hat{L}_2(T_i) = 0$, a estos puntos se les denominará puntos regenerativos. Entonces,

Definición 36.74.1 *Al intervalo de tiempo entre dos puntos regenerativos se le llamará ciclo regenerativo.*

Definición 36.74.2 *Para T_i se define, M_i, el número de ciclos de visita a la cola Q_l, durante el ciclo regenerativo, es decir, M_i es un proceso de renovación.*

Definición 36.74.3 *Para cada uno de los M_i's, se definen a su vez la duración de cada uno de estos ciclos de visita en el ciclo regenerativo, $C_i^{(m)}$, para $m = 1, 2, \ldots, M_i$, que a su vez, también es n proceso de renovación.*

En nuestra notación $V(t) \equiv C_i$ y $X_i = C_i^{(m)}$ para nuestra segunda definición, mientras que para la primera la notación es: $X(t) \equiv C_i$ y $R_i \equiv C_i^{(m)}$.

36.75. Expresion de las Parciales mixtas para F_1 y F_2

1.
$$\frac{\partial}{\partial z_1}\frac{\partial}{\partial z_1}F_1\left(\theta_1\left(\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2), z_2\right)\right)|_{\mathbf{z},\mathbf{w}=1} = 0$$

2.
$$\frac{\partial}{\partial z_2}\frac{\partial}{\partial z_1}F_1\left(\theta_1\left(\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2), z_2\right)\right)|_{\mathbf{z},\mathbf{w}=1} = 0$$

Resultado Principal

Sean $\mu_1,\mu_2,\tilde{\mu}_2,\hat{\mu}_1,\hat{\mu}_2$ y $\tilde{\mu}_2=\mu_2+\tilde{\mu}_2$ los valores esperados de los proceso definidos anteriormente, y sean $r_1,r_2,\hat{r}_1$ y $\hat{r}_2$ los valores esperado s de los tiempos de traslado del servidor entre las colas para cada uno de los sistemas de visitas cíclicas. Si se definen $\mu=\mu_1+\tilde{\mu}_2$, $\hat{\mu}=\hat{\mu}_1+\hat{\mu}_2$, y $r=r_1+r_2$ y $\hat{r}=\hat{r}_1+\hat{r}_2$, entonces se tiene el siguiente resultado.

Teorema 36.75.1 *Supongamos que $\mu<1$, $\hat{\mu}<1$, entonces, el número de usuarios presentes en cada una de las colas que conforman la Red de Sistemas de Visitas Cíclicas cuando uno de los servidores visita a alguna de ellas está*

dada por la solución del Sistema de Ecuaciones Lineales presentados arriba cuyas expresiones damos a continuación:

$$\begin{array}{lll}
f_1(1) = r\frac{\mu_1(1-\mu_1)}{1-\mu}, & f_1(2) = r_2\tilde{\mu}_2, & f_1(3) = \hat{\mu}_1\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right), \\
f_1(4) = \hat{\mu}_2\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right), & f_2(1) = r_1\mu_1, & f_2(2) = r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu}, \\
f_2(3) = \hat{\mu}_1\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right), & f_2(4) = \hat{\mu}_2\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right), & \hat{f}_1(1) = \mu_1\left(\frac{\hat{r}_2\hat{\mu}_2+1}{\hat{\mu}_2} + \hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right), \\
\hat{f}_1(2) = \tilde{\mu}_2\left(\hat{r}_2 + \hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right) + \frac{\mu_2}{\hat{\mu}_2}, & \hat{f}_1(3) = \hat{r}\frac{\hat{\mu}_1(1-\hat{\mu}_1)}{1-\hat{\mu}}, & \hat{f}_1(4) = \hat{r}_2\hat{\mu}_2, \\
\hat{f}_2(1) = \mu_1\left(\frac{\hat{r}_1\hat{\mu}_1+1}{\hat{\mu}_1} + \hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right), & \hat{f}_2(2) = \tilde{\mu}_2\left(\hat{r}_1 + \hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right) + \frac{\mu_2}{\hat{\mu}_1}, & \hat{f}_2(3) = \hat{r}_1\hat{\mu}_1, \\
 & \hat{f}_2(4) = \hat{r}\frac{\hat{\mu}_2(1-\hat{\mu}_2)}{1-\hat{\mu}}. &
\end{array}$$

Las ecuaciones que determinan los segundos momentos de las longitudes de las colas de los dos sistemas se pueden ver en este sitio

Medidas de Desempeño

Definición 36.75.1 *Sea L_i^* el número de usuarios cuando el servidor visita la cola Q_i para dar servicio, para $i = 1, 2$.*

Entonces

Proposición 36.75.1 *Para la cola Q_i, $i = 1, 2$, se tiene que el número de usuarios presentes al momento de ser visitada por el servidor está dado por*

$$\mathbb{E}[L_i^*] = f_i(i) \tag{36.75.1}$$

$$Var[L_i^*] = f_i(i,i) + \mathbb{E}[L_i^*] - \mathbb{E}[L_i^*]^2. \tag{36.75.2}$$

Definición 36.75.2 *El tiempo de Ciclo C_i es el periodo de tiempo que comienza cuando la cola i es visitada por primera vez en un ciclo, y termina cuando es visitado nuevamente en el próximo ciclo, bajo condiciones de estabilidad.*

$$C_i(z) = \mathbb{E}\left[z^{\overline{\tau}_i(m+1)-\overline{\tau}_i(m)}\right]$$

Definición 36.75.3 *El tiempo de intervisita I_i es el periodo de tiempo que comienza cuando se ha completado el servicio en un ciclo y termina cuando es visitada nuevamente en el próximo ciclo.*

$$I_i(z) = \mathbb{E}\left[z^{\tau_i(m+1)-\overline{\tau}_i(m)}\right]$$

Proposición 36.75.2 *Para los tiempos de intervisita del servidor I_i, se tiene que*

$$\begin{aligned}
\mathbb{E}[I_i] &= \frac{f_i(i)}{\mu_i}, \\
Var[I_i] &= \frac{Var\left[L_i^*\right]}{\mu_i^2} - \frac{\sigma_i^2}{\mu_i^2} f_i(i).
\end{aligned}$$

Proposición 36.75.3 *Para los tiempos que ocupa el servidor para atender a los usuarios presentes en la cola Q_i, con FGP denotada por S_i, se tiene que*

$$\begin{aligned}
\mathbb{E}[S_i] &= \frac{\mathbb{E}\left[L_i^*\right]}{1-\mu_i} = \frac{f_i(i)}{1-\mu_i}, \\
Var[S_i] &= \frac{Var\left[L_i^*\right]}{(1-\mu_i)^2} + \frac{\sigma^2\mathbb{E}\left[L_i^*\right]}{(1-\mu_i)^3}
\end{aligned}$$

Proposición 36.75.4 *Para la duración de los ciclos C_i se tiene que*

$$\begin{aligned}
\mathbb{E}[C_i] &= \mathbb{E}[I_i]\,\mathbb{E}[\theta_i(z)] = \frac{\mathbb{E}\left[L_i^*\right]}{\mu_i}\frac{1}{1-\mu_i} = \frac{f_i(i)}{\mu_i(1-\mu_i)} \\
Var[C_i] &= \frac{Var\left[L_i^*\right]}{\mu_i^2(1-\mu_i)^2}.
\end{aligned}$$

Conjeturas

Definición 36.75.4 *Dada una cola Q_i, sea $\mathcal{L} = \left\{L_1(t), L_2(t), \hat{L}_1(t), \hat{L}_2(t)\right\}$ las longitudes de todas las colas de la Red de Sistemas de Visitas Cíclicas. Supóngase que el servidor visita Q_i, si $L_i(t) = 0$ y $\hat{L}_i(t) = 0$ para $i = 1, 2$, entonces los elementos de $\mathcal{L}$ son puntos regenerativos.*

Definición 36.75.5 *Un ciclo regenerativo es el intervalo de tiempo que ocurre entre dos puntos regenerativos sucesivos, $\mathcal{L}_1, \mathcal{L}_2$.*

Defínanse los puntos de regenaración en el proceso $[L_1(t), L_2(t), \ldots, L_N(t)]$. Los puntos cuando la cola i es visitada y todos los $L_j(\tau_i(m)) = 0$ para $i = 1, 2$ son puntos de regeneración. Se llama ciclo regenerativo al intervalo entre dos puntos regenerativos sucesivos.

Sea M_i el número de ciclos de visita en un ciclo regenerativo, y sea $C_i^{(m)}$, para $m = 1, 2, \ldots, M_i$ la duración del m-ésimo ciclo de visita en un ciclo regenerativo. Se define el ciclo del tiempo de visita promedio $\mathbb{E}[C_i]$ como

$$\mathbb{E}[C_i] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right]}{\mathbb{E}[M_i]}$$

En Stid72 y Heym82 se muestra que una condición suficiente para que el proceso regenerativo estacionario sea un procesoo estacionario es que el valor esperado del tiempo del ciclo regenerativo sea finito:

$$\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right] < \infty.$$

como cada $C_i^{(m)}$ contiene intervalos de réplica positivos, se tiene que $\mathbb{E}[M_i] < \infty$, además, como $M_i > 0$, se tiene que la condición anterior es equivalente a tener que

$$\mathbb{E}[C_i] < \infty,$$

por lo tanto una condición suficiente para la existencia del proceso regenerativo está dada por

$$\sum_{k=1}^{N} \mu_k < 1.$$

Sea la función generadora de momentos para L_i, el número de usuarios en la cola $Q_i(z)$ en cualquier momento, está dada por el tiempo promedio de $z^{L_i(t)}$ sobre el ciclo regenerativo definido anteriormente:

$$Q_i(z) = \mathbb{E}\left[z^{L_i(t)}\right] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i} \sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}\left[\sum_{m=1}^{M_i} \tau_i(m+1) - \tau_i(m)\right]}$$

M_i es un tiempo de paro en el proceso regenerativo con $\mathbb{E}[M_i] < \infty$, se sigue del lema de Wald que:

$$\begin{aligned}
\mathbb{E}\left[\sum_{m=1}^{M_i} \sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}[M_i]\,\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] \\
\mathbb{E}\left[\sum_{m=1}^{M_i} \tau_i(m+1) - \tau_i(m)\right] &= \mathbb{E}[M_i]\,\mathbb{E}[\tau_i(m+1) - \tau_i(m)]
\end{aligned}$$

por tanto se tiene que

$$Q_i(z) = \frac{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}[\tau_i(m+1) - \tau_i(m)]}$$

observar que el denominador es simplemente la duración promedio del tiempo del ciclo.

Se puede demostrar (ver Hideaki Takagi 1986) que

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = z\frac{F_i(z) - 1}{z - P_i(z)}$$

Durante el tiempo de intervisita para la cola i, $L_i(t)$ solamente se incrementa de manera que el incremento por intervalo de tiempo está dado por la función generadora de probabilidades de $P_i(z)$, por tanto la suma sobre el tiempo de intervisita puede evaluarse como:

$$\begin{aligned}
\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} \{P_i(z)\}^{t-\overline{\tau}_i(m)}\right] \\
&= \frac{1-\mathbb{E}\left[\{P_i(z)\}^{\tau_i(m+1)-\overline{\tau}_i(m)}\right]}{1-P_i(z)} = \frac{1-I_i[P_i(z)]}{1-P_i(z)}
\end{aligned}$$

por tanto

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = \frac{1-F_i(z)}{1-P_i(z)}$$

Haciendo uso de lo hasta ahora desarrollado se tiene que

$$\begin{aligned}
Q_i(z) &= \frac{1}{\mathbb{E}[C_i]} \cdot \frac{1-F_i(z)}{P_i(z)-z} \cdot \frac{(1-z)P_i(z)}{1-P_i(z)} \\
&= \frac{\mu_i(1-\mu_i)}{f_i(i)} \cdot \frac{1-F_i(z)}{P_i(z)-z} \cdot \frac{(1-z)P_i(z)}{1-P_i(z)}
\end{aligned}$$

derivando con respecto a z

$$\begin{aligned}
\frac{dQ_i(z)}{dz} &= \frac{(1-F_i(z))P_i(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\
&- \frac{(1-z)P_i(z)F_i'(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\
&- \frac{(1-z)(1-F_i(z))P_i(z)\left(P_i'(z)-1\right)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)^2} \\
&+ \frac{(1-z)(1-F_i(z))P_i'(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\
&+ \frac{(1-z)(1-F_i(z))P_i(z)P_i'(z)}{\mathbb{E}[C_i](1-P_i(z))^2(P_i(z)-z)}
\end{aligned}$$

Calculando el límite cuando $z \to 1^+$:

$$Q_i^{(1)}(z) = lim_{z\to 1^+}\frac{dQ_i(z)}{dz} \tag{36.75.3}$$

$$= lim_{z\to 1}\frac{(1-F_i(z))P_i(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \tag{36.75.4}$$

$$- lim_{z\to 1^+}\frac{(1-z)P_i(z)F_i'(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \tag{36.75.5}$$

$$- lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i(z)\left(P_i'(z)-1\right)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)^2} \tag{36.75.6}$$

$$+ lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i'(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \tag{36.75.7}$$

$$+ lim_{z\to 1^+}\frac{(1-z)(1-F_i(nz))P_i(z)P_i'(z)}{\mathbb{E}[C_i](1-P_i(z))^2(P_i(z)-z)} \tag{36.75.8}$$

Entonces:

$$lim_{z\to 1^+}\frac{(1-F_i(z))P_i(z)}{(1-P_i(z))(P_i(z)-z)} = lim_{z\to 1^+}\frac{\frac{d}{dz}[(1-F_i(z))P_i(z)]}{\frac{d}{dz}[(1-P_i(z))(-z+P_i(z))]}$$

$$= lim_{z\to 1^+}\frac{-P_i(z)F_i'(z)+(1-F_i(z))P_i'(z)}{(1-P_i(z))\left(-1+P_i'(z)\right)-(-z+P_i(z))P_i'(z)}$$

$$
\begin{aligned}
& lim_{z\to 1^+} \frac{(1-z)\,P_i(z)\,F_i^{'}(z)}{(1-P_i(z))\,(P_i(z)-z)} = lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)\,P_i(z)\,F_i^{'}(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))\,(P_i(z)-z)\right]} \\
= \quad & lim_{z\to 1^+} \frac{-P_i(z)\,F_i^{'}(z)+(1-z)F_i^{'}(z)\,P_i^{'}(z)+(1-z)P_i(z)\,F_i^{''}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))\,P_i^{'}(z)}
\end{aligned}
$$

$$
\begin{aligned}
& lim_{z\to 1^+} \frac{(1-z)\,(1-F_i(z))\,P_i(z)\left(P_i^{'}(z)-1\right)}{(1-P_i(z))\,(P_i(z)-z)^2} \\
= \quad & lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)\,(1-F_i(z))\,P_i(z)\left(P_i^{'}(z)-1\right)\right]}{\frac{d}{dz}\left[(1-P_i(z))\,(P_i(z)-z)^2\right]} \\
= \quad & lim_{z\to 1^+} \frac{-(1-F_i(z))\,P_i(z)\left(-1+P_i^{'}(z)\right)-(1-z)P_i(z)\,F_i^{'}(z)\left(-1+P_i^{'}(z)\right)}{2\,(1-P_i(z))\,(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2\,P_i^{'}(z)} \\
+ \quad & lim_{z\to 1^+} \frac{+(1-z)\,(1-F_i(z))\left(-1+P_i^{'}(z)\right)P_i^{'}(z)}{2\,(1-P_i(z))\,(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2\,P_i^{'}(z)} \\
+ \quad & lim_{z\to 1^+} \frac{+(1-z)\,(1-F_i(z))\,P_i(z)\,P_i^{''}(z)}{2\,(1-P_i(z))\,(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2\,P_i^{'}(z)}
\end{aligned}
$$

$$
\begin{aligned}
& lim_{z\to 1^+} \frac{(1-z)\,(1-F_i(z))\,P_i^{'}(z)}{(1-P_i(z))\,(P_i(z)-z)} = lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)\,(1-F_i(z))\,P_i^{'}(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))\,(P_i(z)-z)\right]} \\
= \quad & lim_{z\to 1^+} \frac{-(1-F_i(z))\,P_i^{'}(z)-(1-z)F_i^{'}(z)\,P_i^{'}(z)+(1-z)\,(1-F_i(z))\,P_i^{''}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))\,P_i^{'}(z)}
\end{aligned}
$$

$$
\begin{aligned}
& lim_{z\to 1^+} \frac{(1-z)\,(1-F_i(z))\,P_i(z)\,P_i^{'}(z)}{(1-P_i(z))^2\,(P_i(z)-z)} \\
= \quad & lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)\,(1-F_i(z))\,P_i(z)\,P_i^{'}(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))^2\,(P_i(z)-z)\right]} \\
= \quad & lim_{z\to 1^+} \frac{-(1-F_i(z))\,P_i(z)\,P_i^{'}(z)-(1-z)P_i(z)\,F_i^{'}(z)\,P_i^{'}[z]}{(1-P_i(z))^2\left(-1+P_i^{'}(z)\right)-2\,(1-P_i(z))\,(-z+P_i(z))\,P_i^{'}(z)} \\
+ \quad & lim_{z\to 1^+} \frac{(1-z)\,(1-F_i(z))\,P_i^{'}(z)^2+(1-z)\,(1-F_i(z))\,P_i(z)\,P_i^{''}(z)}{(1-P_i(z))^2\left(-1+P_i^{'}(z)\right)-2\,(1-P_i(z))\,(-z+P_i(z))\,P_i^{'}(z)}
\end{aligned}
$$

Longitudes de la Cola en cualquier tiempo

Sea $V_i(z) = \frac{1}{\mathbb{E}[C_i]}\frac{I_i(z)-1}{z-P_i(z)}$

$$
\frac{\partial V_i(z)}{\partial z} = \frac{1}{\mathbb{E}[C_i]}\left[\frac{I_i{'}(z)\,(z-P_i(z))}{z-P_i(z)} - \frac{(I_i(z)-1)\,(1-P_i{'}(z))}{(z-P_i(z))^2}\right]
$$

La FGP para el tiempo de espera para cualquier usuario en la cola está dada por:

$$
U_i(z) = \frac{1}{\mathbb{E}[C_i]}\cdot\frac{1-P_i(z)}{z-P_i(z)}\cdot\frac{I_i(z)-1}{1-z}
$$

entonces

$$\begin{aligned}
\frac{d}{dz}V_i(z) &= \frac{1}{\mathbb{E}[C_i]}\left\{\frac{d}{dz}\left(\frac{1-P_i(z)}{z-P_i(z)}\right)\frac{I_i(z)-1}{1-z}+\frac{1-P_i(z)}{z-P_i(z)}\frac{d}{dz}\left(\frac{I_i(z)-1}{1-z}\right)\right\}\\
&= \frac{1}{\mathbb{E}[C_i]}\left\{\frac{-P_i(z)(z-P_i(z))-(1-P_i(z))\left(1-P_i'(z)\right)}{(z-P_i(z))^2}\cdot\frac{I_i(z)-1}{1-z}\right\}\\
&+ \frac{1}{\mathbb{E}[C_i]}\left\{\frac{1-P_i(z)}{z-P_i(z)}\cdot\frac{I_i'(z)(1-z)+(I_i(z)-1)}{(1-z)^2}\right\}
\end{aligned}$$

$$\begin{aligned}
\frac{\partial U_i(z)}{\partial z} &= \frac{(-1+I_i[z])(1-P_i[z])}{(1-z)^2\mathbb{E}[I_i](z-P_i[z])}+\frac{(1-P_i[z])I_i'[z]}{(1-z)\mathbb{E}[I_i](z-P_i[z])}\\
&- \frac{(-1+I_i[z])(1-P_i[z])(1-P'[z])}{(1-z)\mathbb{E}[I_i](z-P_i[z])^2}-\frac{(-1+I_i[z])P_i{}'[z]}{(1-z)\mathbb{E}[I_i](z-P_i[z])}
\end{aligned}$$

36.76. Sistemas de Visitas Cíclicas

36.77. Definiciones

Se considerarán intervalos de tiempo de la forma $[t, t+1]$. Los usuarios arriban por paquetes de manera independiente del resto de las colas. Se define el grupo de usuarios que llegan a cada una de las colas del sistema 1, caracterizadas por Q_1 y Q_2 respectivamente, en el intervalo de tiempo $[t, t+1]$ por $X_1(t), X_2(t)$.

Para cada uno de los procesos anteriores se define su Función Generadora de Probabilidades (PGF):

$$P_1(z_1) = \mathbb{E}\left[z_1^{X_1(t)}\right], \quad P_2(z_2) = \mathbb{E}\left[z_2^{X_2(t)}\right].$$

Con primer momento definidos por

$$\begin{aligned}
\mu_1 &= \mathbb{E}[X_1(t)] = P_1^{(1)}(1),\\
\mu_2 &= \mathbb{E}[X_2(t)] = P_2^{(1)}(1).
\end{aligned}$$

En lo que respecta al servidor, en términos de los tiempos de visita a cada una de las colas, se denotarán por τ_1, τ_2 para Q_1, Q_2 respectivamente; y a los tiempos en que el servidor termina de atender en las colas Q_1, Q_2, se les denotará por $\overline{\tau}_1, \overline{\tau}_2$ respectivamente. Entonces, los tiempos de servicio están dados por las diferencias $\overline{\tau}_1 - \tau_1, \overline{\tau}_2 - \tau_2$ para Q_1, Q_2. Análogamente los tiempos de traslado del servidor desde el momento en que termina de atender a una cola y llega a la siguiente para comenzar a dar servicio están dados por $\tau_2 - \overline{\tau}_1, \tau_1 - \overline{\tau}_2$.

La FGP para estos tiempos de traslado están dados por

$$R_1(z_1) = \mathbb{E}\left[z_1^{\tau_2-\overline{\tau}_1}\right], \quad R_2(z_2) = \mathbb{E}\left[z_2^{\tau_1-\overline{\tau}_2}\right],$$

y al igual que como se hizo con anterioridad

$$r_1 = R_1^{(1)}(1) = \mathbb{E}[\tau_2 - \overline{\tau}_1], \quad r_2 = R_2^{(1)}(1) = \mathbb{E}[\tau_1 - \overline{\tau}_2],$$

Sean α_1, α_2 el número de usuarios que arriban en grupo a la cola Q_1 y Q_2 respectivamente. Sus PGF's están definidas como

$$A_1(z) = \mathbb{E}\left[z^{\alpha_1(t)}\right], \quad A_2(z) = \mathbb{E}\left[z^{\alpha_2(t)}\right].$$

Su primer momento está dado por

$$\lambda_1 = \mathbb{E}[\alpha_1(t)] = A_1^{(1)}(1), \quad \lambda_2 = \mathbb{E}[\alpha_2(t)] = A_2^{(1)}(1).$$

Sean β_1, β_2 el número de usuarios que arriban en el grupo α_1, α_2 a la cola Q_1 y Q_2, respectivamente, de igual manera se definen sus PGF's

$$B_1(z) = \mathbb{E}\left[z^{\beta_1(t)}\right], \quad B_2(z) = \mathbb{E}\left[z^{\beta_2(t)}\right],$$

con

$$b_1 = \mathbb{E}\left[\beta_1(t)\right] = B_1^{(1)}(1), \quad b_2 = \mathbb{E}\left[\beta_2(t)\right] = B_2^{(1)}(1).$$

La distribución para el número de grupos que arriban al sistema en cada una de las colas se definen por:

$$P_1(z_1) = A_1\left[B_1(z_1)\right] = \mathbb{E}\left[B_1(z_1)^{\alpha_1(t)}\right], \quad P_2(z_1) = A_1\left[B_1(z_1)\right] = \mathbb{E}\left[B_1(z_1)^{\alpha_1(t)}\right],$$

entonces

$$\begin{aligned} P_1^{(1)}(1) &= \mathbb{E}\left[\alpha_1(t) B_1^{(1)}(1)\right] = B_1^{(1)}(1)\,\mathbb{E}\left[\alpha_1(t)\right] = \lambda_1 b_1 \\ P_2^{(1)}(1) &= \mathbb{E}\left[\alpha_2(t) B_2^{(1)}(1)\right] = B_2^{(1)}(1)\,\mathbb{E}\left[\alpha_2(t)\right] = \lambda_2 b_2. \end{aligned}$$

36.78. La ruina del jugador

Supongamos que se tiene un jugador que cuenta con un capital inicial de $L_0 \geq 0$ unidades, esta persona realiza una seria de juegos de manera sucesiva, dichos eventos son independientes e idénticos.

La ganancia en el n-ésimo juego es X_n unidades de las cuales se resta una cuota de 1 unidad por cada juego. Su PGF está dada por

$$\begin{aligned} F(z) &= \mathbb{E}\left[z^{L_0}\right] \\ P(z) &= \mathbb{E}\left[z^{X_n}\right] \\ \mu &= \mathbb{E}\left[X_n\right] < 1. \end{aligned}$$

Sea L_n el capital remanente después del n-ésimo juego. Entonces

$$L_n = L_0 + X_1 + X_2 + \cdots + X_n - n.$$

La ruina del jugador ocurre después del n-ésimo juego:

$$T = min\left\{L_n = 0\right\}$$

Si $L_0 = 0$ entonces claramente $T = 0$. En este sentido T es la longitud del periodo de ocuapción del servidor comenzando con L_0 grupos de usuarios que llegan a la cola conforme a un proceso dado por $P(z)$.

Sea $g_{n,k}$ la probabilidad del evento de que el jugador no caiga en la ruina antes del n-ésimo juego, y que tenga un capital de k unidades antes del n-ésimo juego, es decir

Dada $n \in \{1, 2, \ldots, \}$ y $k \in \{0, 1, 2, \ldots, \}$

$$g_{n,k} = P\left\{L_j > 0, j = 1, \ldots, n, L_n = k\right\} \tag{36.78.1}$$

la cual además se puede escribir como

$$g_{n,k} = P\left\{L_j > 0, j = 1, \ldots, n, L_n = k\right\} = \sum_{j=1}^{k+1} g_{n-1,j} P\left\{X_n = k - j + 1\right\} \tag{36.78.2}$$

y

$$g_{0,k} = P\left\{L_0 = k\right\} \tag{36.78.3}$$

Se definen las siguientes PGF

$$G_n(z) = \sum_{k=0}^{\infty} g_{n,k} z^k, \text{ para } n = 0, 1, \ldots,$$

$$G(z,w) = \sum_{n=0}^{\infty} G_n(z) w^n \tag{36.78.4}$$

En particular para $k = 0$

$$g_{n,0} = G_n(0) = P\{L_j > 0, \text{ para } j < n, \text{ y } L_n = 0\} = P\{T = n\},$$

además

$$G(0,w) = \sum_{n=0}^{\infty} G_n(0) w^n = \sum_{n=0}^{\infty} P\{T = n\} w^n = \mathbb{E}\left[w^T\right]$$

la cuál por lo anterior es la PGF del tiempo de ruina T.

Proposición 36.78.1 *Sean $G_n(z)$ y $G(z,w)$ definidas como en 36.78.4 y 36.78.4 respectivamente, entonces*

$$G_n(z) = \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right] P(z). \tag{36.78.5}$$

Además

$$G(z,w) = \frac{zF(z) - wP(z)G(0,w)}{z - wP(z)}, \tag{36.78.6}$$

con un único polo en el círculo unitario, además, el polo es de la forma $z = \theta(w)$ y satisface que

i) $\theta(1) = 1$,
ii) $\theta^{(1)}(1) = \frac{1}{1-\mu}$,

Finalmente, además se cumple que

$$\mathbb{E}\left[w^T\right] = G(0,w) = F[\theta(w)]. \tag{36.78.7}$$

Corolario 36.78.1 *El tiempo de ruina del jugador tiene primer y segundo momento dados por*

$$\mathbb{E}[T] = \frac{\mathbb{E}[L_0]}{1-\mu} \tag{36.78.8}$$

$$Var[T] = \frac{Var[L_0]}{(1-\mu)^2} + \frac{\sigma^2 \mathbb{E}[L_0]}{(1-\mu)^3}. \tag{36.78.9}$$

36.79. Funciones Generadoras de Probabilidad Conjunta

De lo desarrollado hasta ahora se tiene lo siguiente

$$\begin{aligned}
& \mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)} z_2^{L_2(\overline{\tau}_1)}\right] = \mathbb{E}\left[z_2^{L_2(\overline{\tau}_1)}\right] = \mathbb{E}\left[z_2^{L_2(\tau_1)+X_2(\overline{\tau}_1-\tau_1)}\right] \\
= \; & \mathbb{E}\left[\left\{z_2^{L_2(\tau_1)}\right\}\left\{z_2^{X_2(\overline{\tau}_1-\tau_1)}\right\}\right] = \mathbb{E}\left[\left\{z_2^{L_2(\tau_1)}\right\}\{P_2(z_2)\}^{\overline{\tau}_1-\tau_1}\right] \\
= \; & \mathbb{E}\left[\left\{z_2^{L_2(\tau_1)}\right\}\{\theta_1(P_2(z_2))\}^{L_1(\tau_1)}\right] = F_1(\theta_1(P_2(z_2)), z_2)
\end{aligned}$$

es decir

$$\mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)} z_2^{L_2(\overline{\tau}_1)}\right] = F_1(\theta_1(P_2(z_2)), z_2). \tag{36.79.1}$$

Procediendo de manera análoga para $\overline{\tau}_2$:

$$\begin{aligned}
\mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)} z_2^{L_2(\overline{\tau}_2)}\right] &= \mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)}\right] = \mathbb{E}\left[z_1^{L_1(\tau_2)+X_1(\overline{\tau}_2-\tau_2)}\right] = \mathbb{E}\left[\left\{z_1^{L_1(\tau_2)}\right\}\left\{z_1^{X_1(\overline{\tau}_2-\tau_2)}\right\}\right] \\
&= \mathbb{E}\left[\left\{z_1^{L_1(\tau_2)}\right\}\{P_1(z_1)\}^{\overline{\tau}_2-\tau_2}\right] = \mathbb{E}\left[\left\{z_1^{L_1(\tau_2)}\right\}\{\theta_2(P_1(z_1))\}^{L_2(\tau_2)}\right] \\
&= F_2(z_1, \theta_2(P_1(z_1)))
\end{aligned}$$

$$\mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)} z_2^{L_2(\overline{\tau}_2)}\right] = F_2\left(z_1, \theta_2\left(P_1\left(z_1\right)\right)\right) \tag{36.79.2}$$

Ahora, para el intervalo de tiempo $[\overline{\tau}_1, \tau_2]$ y $[\overline{\tau}_2, \tau_1]$, los arribos de los usuarios modifican el número de usuarios que llegan a las colas, es decir, los procesos $L_1(t)$ y $L_2(t)$. La PGF para el número de arribos a todas las estaciones durante el intervalo $[\overline{\tau}_1, \tau_2]$ cuya distribución está especificada por la distribución compuesta $R_1(\mathbf{z}), R_2(\mathbf{z})$:

$$R_1(\mathbf{z}) = R_1\left(\prod_{i=1}^{2} P(z_i)\right) = \mathbb{E}\left[\left\{\prod_{i=1}^{2} P(z_i)\right\}^{\tau_2 - \overline{\tau}_1}\right]$$
$$R_2(\mathbf{z}) = R_2\left(\prod_{i=1}^{2} P(z_i)\right) = \mathbb{E}\left[\left\{\prod_{i=1}^{2} P(z_i)\right\}^{\tau_1 - \overline{\tau}_2}\right]$$

Dado que los eventos en $[\tau_1, \overline{\tau}_1]$ y $[\overline{\tau}_1, \tau_2]$ son independientes, la PGF conjunta para el número de usuarios en el sistema al tiempo $t = \tau_2$ la PGF conjunta para el número de usuarios en el sistema están dadas por

$$\begin{aligned} F_1(\mathbf{z}) &= R_2\left(\prod_{i=1}^{2} P(z_i)\right) F_2\left(z_1, \theta_2\left(P_1\left(z_1\right)\right)\right) \\ F_2(\mathbf{z}) &= R_1\left(\prod_{i=1}^{2} P(z_i)\right) F_1\left(\theta_1\left(P_2\left(z_2\right)\right), z_2\right) \end{aligned}$$

Entonces debemos de determinar las siguientes expresiones:

$$\begin{aligned} f_1(1) &= \tfrac{\partial F_1(\mathbf{z})}{\partial z_1}|_{\mathbf{z}=1}, \quad f_1(2) = \tfrac{\partial F_1(\mathbf{z})}{\partial z_2}|_{\mathbf{z}=1}, \\ f_2(1) &= \tfrac{\partial F_2(\mathbf{z})}{\partial z_1}|_{\mathbf{z}=1}, \quad f_2(2) = \tfrac{\partial F_2(\mathbf{z})}{\partial z_2}|_{\mathbf{z}=1}, \end{aligned}$$

$$\begin{aligned} \frac{\partial R_1(\mathbf{z})}{\partial z_1}|_{\mathbf{z}=1} &= R_1^{(1)}(1) P_1^{(1)}(1) \\ \frac{\partial R_1(\mathbf{z})}{\partial z_2}|_{\mathbf{z}=1} &= R_1^{(1)}(1) P_2^{(1)}(1) \\ \frac{\partial R_2(\mathbf{z})}{\partial z_1}|_{\mathbf{z}=1} &= R_2^{(1)}(1) P_1^{(1)}(1) \\ \frac{\partial R_2(\mathbf{z})}{\partial z_2}|_{\mathbf{z}=1} &= R_2^{(1)}(1) P_2^{(1)}(1) \end{aligned}$$

$$\begin{aligned} \frac{\partial}{\partial z_1} F_1\left(\theta_1\left(P_2\left(z_2\right)\right), z_2\right) &= 0 \\ \frac{\partial}{\partial z_2} F_1\left(\theta_1\left(P_2\left(z_2\right)\right), z_2\right) &= \frac{\partial F_1}{\partial z_2} + \frac{\partial F_1}{\partial z_1} \theta_1^{(1)} P_2^{(1)}(1) \\ \frac{\partial}{\partial z_1} F_2\left(z_1, \theta_2\left(P_1\left(z_1\right)\right)\right) &= \frac{\partial F_2}{\partial z_1} + \frac{\partial F_2}{\partial z_2} \theta_2^{(1)} P_1^{(1)}(1) \\ \frac{\partial}{\partial z_2} F_2\left(z_1, \theta_2\left(P_1\left(z_1\right)\right)\right) &= 0 \end{aligned}$$

Por lo tanto de las dos secciones anteriores se tiene que:

$$\begin{aligned} \frac{\partial F_1}{\partial z_1} &= \frac{\partial R_2}{\partial z_1}|_{\mathbf{z}=1} + \frac{\partial F_2}{\partial z_1}|_{\mathbf{z}=1} = R_2^{(1)}(1) P_1^{(1)}(1) + f_2(1) + f_2(2) \theta_2^{(1)}(1) P_1^{(1)}(1) \\ \frac{\partial F_1}{\partial z_2} &= \frac{\partial R_2}{\partial z_2}|_{\mathbf{z}=1} + \frac{\partial F_2}{\partial z_2}|_{\mathbf{z}=1} = R_2^{(1)}(1) P_2^{(1)}(1) \\ \frac{\partial F_2}{\partial z_1} &= \frac{\partial R_1}{\partial z_1}|_{\mathbf{z}=1} + \frac{\partial F_1}{\partial z_1}|_{\mathbf{z}=1} = R_1^{(1)}(1) P_1^{(1)}(1) \\ \frac{\partial F_2}{\partial z_2} &= \frac{\partial R_1}{\partial z_2}|_{\mathbf{z}=1} + \frac{\partial F_1}{\partial z_2}|_{\mathbf{z}=1} = R_1^{(1)}(1) P_2^{(1)}(1) + f_1(1) \theta_1^{(1)}(1) P_2^{(1)}(1) \end{aligned}$$

El cual se puede escribir en forma equivalente:

$$\begin{aligned}
f_1(1) &= r_2\mu_1 + f_2(1) + f_2(2)\frac{\mu_1}{1-\mu_2} \\
f_1(2) &= r_2\mu_2 \\
f_2(1) &= r_1\mu_1 \\
f_2(2) &= r_1\mu_2 + f_1(2) + f_1(1)\frac{\mu_2}{1-\mu_1}
\end{aligned}$$

De donde:

$$\begin{aligned}
f_1(1) &= \mu_1\left[r_2 + \frac{f_2(2)}{1-\mu_2}\right] + f_2(1) \\
f_2(2) &= \mu_2\left[r_1 + \frac{f_1(1)}{1-\mu_1}\right] + f_1(2)
\end{aligned}$$

Resolviendo para $f_1(1)$:

$$\begin{aligned}
f_1(1) &= r_2\mu_1 + f_2(1) + f_2(2)\frac{\mu_1}{1-\mu_2} = r_2\mu_1 + r_1\mu_1 + f_2(2)\frac{\mu_1}{1-\mu_2} \\
&= \mu_1(r_2 + r_1) + f_2(2)\frac{\mu_1}{1-\mu_2} = \mu_1\left(r + \frac{f_2(2)}{1-\mu_2}\right),
\end{aligned}$$

entonces

$$\begin{aligned}
f_2(2) &= \mu_2\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + f_1(2) = \mu_2\left(r_1 + \frac{f_1(1)}{1-\mu_1}\right) + r_2\mu_2 \\
&= \mu_2\left[r_1 + r_2 + \frac{f_1(1)}{1-\mu_1}\right] = \mu_2\left[r + \frac{f_1(1)}{1-\mu_1}\right] \\
&= \mu_2 r + \mu_1\left(r + \frac{f_2(2)}{1-\mu_2}\right)\frac{\mu_2}{1-\mu_1} \\
&= \mu_2 r + \mu_2\frac{r\mu_1}{1-\mu_1} + f_2(2)\frac{\mu_1\mu_2}{(1-\mu_1)(1-\mu_2)} \\
&= \mu_2\left(r + \frac{r\mu_1}{1-\mu_1}\right) + f_2(2)\frac{\mu_1\mu_2}{(1-\mu_1)(1-\mu_2)} \\
&= \mu_2\left(\frac{r}{1-\mu_1}\right) + f_2(2)\frac{\mu_1\mu_2}{(1-\mu_1)(1-\mu_2)}
\end{aligned}$$

entonces

$$\begin{aligned}
f_2(2) - f_2(2)\frac{\mu_1\mu_2}{(1-\mu_1)(1-\mu_2)} &= \mu_2\left(\frac{r}{1-\mu_1}\right) \\
f_2(2)\left(1 - \frac{\mu_1\mu_2}{(1-\mu_1)(1-\mu_2)}\right) &= \mu_2\left(\frac{r}{1-\mu_1}\right) \\
f_2(2)\left(\frac{1-\mu_1-\mu_2+\mu_1\mu_2-\mu_1\mu_2}{(1-\mu_1)(1-\mu_2)}\right) &= \mu_2\left(\frac{r}{1-\mu_1}\right) \\
f_2(2)\left(\frac{1-\mu}{(1-\mu_1)(1-\mu_2)}\right) &= \mu_2\left(\frac{r}{1-\mu_1}\right)
\end{aligned}$$

por tanto

$$\begin{aligned}
f_2(2) &= \frac{r\frac{\mu_2}{1-\mu_1}}{\frac{1-\mu}{(1-\mu_1)(1-\mu_2)}} = \frac{r\mu_2(1-\mu_1)(1-\mu_2)}{(1-\mu_1)(1-\mu)} \\
&= \frac{\mu_2(1-\mu_2)}{1-\mu}r = r\mu_2\frac{1-\mu_2}{1-\mu}.
\end{aligned}$$

es decir

$$f_2(2) = r\mu_2\frac{1-\mu_2}{1-\mu}. \tag{36.79.3}$$

Entonces

$$\begin{aligned} f_1(1) &= \mu_1 r + f_2(2)\frac{\mu_1}{1-\mu_2} = \mu_1 r + \left(\frac{\mu_2(1-\mu_2)}{1-\mu} r\right)\frac{\mu_1}{1-\mu_2} \\ &= \mu_1 r + \mu_1 r\left(\frac{\mu_2}{1-\mu}\right) = \mu_1 r\left[1+\frac{\mu_2}{1-\mu}\right] \\ &= r\mu_1\frac{1-\mu_1}{1-\mu} \end{aligned}$$

36.80. Definiciones

- Consideremos una red de sistema de visitas cíclicas conformada por dos sistemas de visitas cíclicas, cada una con dos colas independientes, donde además se permite el intercambio de usuarios entre los dos sistemas en la segunda cola de cada uno de ellos.
- Supóngase además que los arribos de los usuarios ocurren conforme a un proceso Poisson con tasa de llegada μ_1 y μ_2 para el sistema 1, mientras que para el sistema 2, lo hacen conforme a un proceso Poisson con tasa $\hat{\mu}_1, \hat{\mu}_2$ respectivamente.

El traslado de un sistema a otro ocurre de manera que los tiempos entre llegadas de los usuarios a la cola dos del sistema 1 provenientes del sistema 2, se distribuye de manera exponencial con parámetro $\check{\mu}_2$.

Se considerarán intervalos de tiempo de la forma $[t, t+1]$. Los usuarios arriban por paquetes de manera independiente del resto de las colas. Se define el grupo de usuarios que llegan a cada una de las colas del sistema 1, caracterizadas por Q_1 y Q_2 respectivamente, en el intervalo de tiempo $[t, t+1]$ por $X_1(t), X_2(t)$. De igual manera se definen los procesos $\hat{X}_1(t), \hat{X}_2(t)$ para las colas del sistema 2, denotadas por $\hat{Q}_1$ y $\hat{Q}_2$ respectivamente.

Para el número de usuarios que se trasladan del sistema 2 al sistema 1, de la cola $\hat{Q}_2$ a la cola Q_2, en el intervalo de tiempo $[t, t+1]$, se define el proceso $Y_2(t)$.

36.81. La ruina del jugador

Supongamos que se tiene un jugador que cuenta con un capital inicial de $\tilde{L}_0 \geq 0$ unidades, esta persona realiza una serie de dos juegos simultáneos e independientes de manera sucesiva, dichos eventos son independientes e idénticos entre sí para cada realización.

La ganancia en el n-ésimo juego es

$$\tilde{X}_n = X_n + Y_n \tag{36.81.1}$$

unidades de las cuales se resta una cuota de 1 unidad por cada juego simultáneo, es decir, se restan dos unidades por cada juego realizado.

En términos de la teoría de colas puede pensarse como el número de usuarios que llegan a una cola vía dos procesos de arribo distintos e independientes entre sí.

Su Función Generadora de Probabilidades (FGP) está dada por

$$\begin{aligned} F(z) &= \mathbb{E}\left[z^{\tilde{L}_0}\right] \\ \tilde{P}(z) &= \mathbb{E}\left[z^{\tilde{X}_n}\right] = \mathbb{E}\left[z^{X_n+Y_n}\right] \\ &= \mathbb{E}\left[z^{X_n} z^{Y_n}\right] = \mathbb{E}\left[z^{X_n}\right]\mathbb{E}\left[z^{Y_n}\right] \\ &= P(z)\check{P}(z) \end{aligned}$$

entonces

$$\tilde{\mu} = \mathbb{E}\left[\tilde{X}_n\right] = \tilde{P}[z] < 1.$$

Sea $\tilde{L}_n$ el capital remanente después del n-ésimo juego. Entonces

$$\tilde{L}_n = \tilde{L}_0 + \tilde{X}_1 + \tilde{X}_2 + \cdots + \tilde{X}_n - 2n.$$

La ruina del jugador ocurre después del n-ésimo juego, es decir, la cola se vacía después del n-ésimo juego, entonces sea T definida como

$$T \quad = \quad min\left\{\tilde{L}_n = 0\right\}$$

Si $\tilde{L}_0 = 0$, entonces claramente $T = 0$. En este sentido T puede interpretarse como la longitud del periodo de tiempo que el servidor ocupa para dar servicio en la cola, comenzando con $\tilde{L}_0$ grupos de usuarios presentes en la cola, quienes arribaron conforme a un proceso dado por $\tilde{P}(z)$.

Sea $g_{n,k}$ la probabilidad del evento de que el jugador no caiga en ruina antes del n-ésimo juego, y que además tenga un capital de k unidades antes del n-ésimo juego, es decir,

Dada $n \in \{1, 2, \ldots, \}$ y $k \in \{0, 1, 2, \ldots, \}$

$$g_{n,k} := P\left\{\tilde{L}_j > 0, j = 1, \ldots, n, \tilde{L}_n = k\right\}$$

la cual además se puede escribir como:

$$\begin{aligned}
g_{n,k} &= P\left\{\tilde{L}_j > 0, j = 1, \ldots, n, \tilde{L}_n = k\right\} = \sum_{j=1}^{k+1} g_{n-1,j} P\left\{\tilde{X}_n = k - j + 1\right\} \\
&= \sum_{j=1}^{k+1} g_{n-1,j} P\left\{X_n + Y_n = k - j + 1\right\} \\
&= \sum_{j=1}^{k+1} \sum_{l=1}^{j} g_{n-1,j} P\left\{X_n + Y_n = k - j + 1, Y_n = l\right\}
\end{aligned}$$

$$\begin{aligned}
&= \sum_{j=1}^{k+1} \sum_{l=1}^{j} g_{n-1,j} P\left\{X_n + Y_n = k - j + 1 | Y_n = l\right\} P\left\{Y_n = l\right\} \\
&= \sum_{j=1}^{k+1} \sum_{l=1}^{j} g_{n-1,j} P\left\{X_n = k - j - l + 1\right\} P\left\{Y_n = l\right\}
\end{aligned}$$

es decir

$$g_{n,k} = \sum_{j=1}^{k+1} \sum_{l=1}^{j} g_{n-1,j} P\left\{X_n = k - j - l + 1\right\} P\left\{Y_n = l\right\} \tag{36.81.2}$$

además

$$g_{0,k} = P\left\{\tilde{L}_0 = k\right\}. \tag{36.81.3}$$

Se definen las siguientes FGP:

$$G_n(z) = \sum_{k=0}^{\infty} g_{n,k} z^k, \text{ para } n = 0, 1, \ldots, \tag{36.81.4}$$

$$G(z, w) = \sum_{n=0}^{\infty} G_n(z) w^n. \tag{36.81.5}$$

En particular para $k = 0$,

$$g_{n,0} = G_n(0) = P\left\{\tilde{L}_j > 0, \text{ para } j < n, \text{ y } \tilde{L}_n = 0\right\} = P\left\{T = n\right\},$$

además

$$G(0, w) = \sum_{n=0}^{\infty} G_n(0) w^n = \sum_{n=0}^{\infty} P\left\{T = n\right\} w^n = \mathbb{E}\left[w^T\right]$$

la cuál resulta ser la FGP del tiempo de ruina T.

Proposición 36.81.1 *Sean $G_n(z)$ y $G(z, w)$ definidas como en (36.81.4) y (36.81.5) respectivamente, entonces*

$$G_n(z) = \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z). \tag{36.81.6}$$

Además

$$G(z, w) = \frac{zF(z) - wP(z)G(0, w)}{z - wR(z)}, \tag{36.81.7}$$

con un único polo en el círculo unitario, además, el polo es de la forma $z = \theta(w)$ y satisface que

i) $\tilde{\theta}(1) = 1$,

ii) $\tilde{\theta}^{(1)}(1) = \frac{1}{1-\tilde{\mu}}$,

iii) $\tilde{\theta}^{(2)}(1) = \frac{\tilde{\mu}}{(1-\tilde{\mu})^2} + \frac{\tilde{\sigma}}{(1-\tilde{\mu})^3}$.

Finalmente, además se cumple que

$$\mathbb{E}\left[w^T\right] = G(0,w) = F\left[\tilde{\theta}(w)\right]. \tag{36.81.8}$$

Multiplicando las ecuaciones (36.81.2) y (36.81.3) por el término z^k:

$$\begin{aligned} g_{n,k}z^k &= \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}P\{X_n = k-j-l+1\}P\{Y_n = l\}z^k, \\ g_{0,k}z^k &= P\left\{\tilde{L}_0 = k\right\}z^k, \end{aligned}$$

ahora sumamos sobre k

$$\begin{aligned} \sum_{k=0}^{\infty} g_{n,k}z^k &= \sum_{k=0}^{\infty}\sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}P\{X_n = k-j-l+1\}P\{Y_n = l\}z^k \\ &= \sum_{k=0}^{\infty} z^k \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}P\{X_n = k-(j+l-1)\}P\{Y_n = l\} \\ &= \sum_{k=0}^{\infty} z^{k+(j+l-1)-(j+l-1)} \sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}P\{X_n = k-(j+l-1)\}P\{Y_n = l\} \\ &= \sum_{k=0}^{\infty}\sum_{j=1}^{k+1}\sum_{l=1}^{j} g_{n-1,j}z^{j-1}P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}P\{Y_n = l\}z^l \end{aligned}$$

luego

$$\begin{aligned} &= \sum_{j=1}^{\infty}\sum_{l=1}^{j} g_{n-1,j}z^{j-1} \sum_{k=j+l-1}^{\infty} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}P\{Y_n = l\}z^l \\ &= \sum_{j=1}^{\infty} g_{n-1,j}z^{j-1} \sum_{l=1}^{j}\sum_{k=j+l-1}^{\infty} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}P\{Y_n = l\}z^l \\ &= \sum_{j=1}^{\infty} g_{n-1,j}z^{j-1} \sum_{k=j+l-1}^{\infty}\sum_{l=1}^{j} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}P\{Y_n = l\}z^l \\ &= \sum_{j=1}^{\infty} g_{n-1,j}z^{j-1} \sum_{k=j+l-1}^{\infty}\sum_{l=1}^{j} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)}\sum_{l=1}^{j}P\{Y_n = l\}z^l \\ &= \sum_{j=1}^{\infty} g_{n-1,j}z^{j-1}\sum_{l=1}^{\infty}P\{Y_n = l\}z^l \sum_{k=j+l-1}^{\infty}\sum_{l=1}^{j} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)} \\ &= \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z) \sum_{k=j+l-1}^{\infty}\sum_{l=1}^{j} P\{X_n = k-(j+l-1)\}z^{k-(j+l-1)} \\ &= \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z)P(z) = \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z), \end{aligned}$$

es decir la ecuación (36.81.4) se puede reescribir como

$$G_n(z) = \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z). \tag{36.81.9}$$

Por otra parte recordemos la ecuación (36.81.4)

$$G_n(z) = \sum_{k=0}^{\infty} g_{n,k}z^k, \text{ entonces } \frac{G_n(z)}{z} = \sum_{k=1}^{\infty} g_{n,k}z^{k-1},$$

Por lo tanto utilizando la ecuación (36.81.9):

$$\begin{aligned} G(z,w) &= \sum_{n=0}^{\infty} G_n(z) w^n = G_0(z) + \sum_{n=1}^{\infty} G_n(z) w^n \\ &= F(z) + \sum_{n=0}^{\infty} [G_n(z) - G_n(0)] w^n \frac{\tilde{P}(z)}{z} \\ &= F(z) + \frac{w}{z} \sum_{n=0}^{\infty} [G_n(z) - G_n(0)] w^{n-1} \tilde{P}(z) \end{aligned}$$

es decir

$$G(z,w) = F(z) + \frac{w}{z} [G(z,w) - G(0,w)] \tilde{P}(z),$$

entonces

$$\begin{aligned} G(z,w) &= F(z) + \frac{w}{z} [G(z,w) - G(0,w)] \tilde{P}(z) \\ &= F(z) + \frac{w}{z} \tilde{P}(z) G(z,w) - \frac{w}{z} \tilde{P}(z) G(0,w) \\ &\Leftrightarrow \\ G(z,w) \left\{ 1 - \frac{w}{z} \tilde{P}(z) \right\} &= F(z) - \frac{w}{z} \tilde{P}(z) G(0,w), \end{aligned}$$

por lo tanto,

$$G(z,w) = \frac{zF(z) - w\tilde{P}(z) G(0,w)}{1 - w\tilde{P}(z)}. \tag{36.81.10}$$

Ahora $G(z,w)$ es analítica en $|z| = 1$.
Sean z, w tales que $|z| = 1$ y $|w| \leq 1$, como $\tilde{P}(z)$ es FGP

$$|z - \left(z - w\tilde{P}(z)\right)| < |z| \Leftrightarrow |w\tilde{P}(z)| < |z|$$

es decir, se cumplen las condiciones del Teorema de Rouché y por tanto, z y $z - w\tilde{P}(z)$ tienen el mismo número de ceros en $|z| = 1$. Sea $z = \tilde{\theta}(w)$ la solución única de $z - w\tilde{P}(z)$, es decir

$$\tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right) = 0, \tag{36.81.11}$$

con $|\tilde{\theta}(w)| < 1$. Cabe hacer mención que $\tilde{\theta}(w)$ es la FGP para el tiempo de ruina cuando $\tilde{L}_0 = 1$.
Considerando la ecuación (36.81.11)

$$\begin{aligned} &\frac{\partial}{\partial w} \tilde{\theta}(w)|_{w=1} - \frac{\partial}{\partial w} \left\{ w\tilde{P}\left(\tilde{\theta}(w)\right) \right\}|_{w=1} = 0 \\ &\tilde{\theta}^{(1)}(w)|_{w=1} - \frac{\partial}{\partial w} w \left\{ \tilde{P}\left(\tilde{\theta}(w)\right) \right\}|_{w=1} - w \frac{\partial}{\partial w} \tilde{P}\left(\tilde{\theta}(w)\right)|_{w=1} = 0 \\ &\tilde{\theta}^{(1)}(1) - \tilde{P}\left(\tilde{\theta}(1)\right) - w \left\{ \frac{\partial \tilde{P}\left(\tilde{\theta}(w)\right)}{\partial \tilde{\theta}(w)} \cdot \frac{\partial \tilde{\theta}(w)}{\partial w}|_{w=1} \right\} = 0 \\ &\tilde{\theta}^{(1)}(1) - \tilde{P}\left(\tilde{\theta}(1)\right) - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right) \cdot \tilde{\theta}^{(1)}(1) = 0 \end{aligned}$$

luego

$$\begin{aligned} &\tilde{\theta}^{(1)}(1) - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right) \cdot \tilde{\theta}^{(1)}(1) = \tilde{P}\left(\tilde{\theta}(1)\right) \\ &\tilde{\theta}^{(1)}(1) \left(1 - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)\right) = \tilde{P}\left(\tilde{\theta}(1)\right) \\ &\tilde{\theta}^{(1)}(1) = \frac{\tilde{P}\left(\tilde{\theta}(1)\right)}{\left(1 - \tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)\right)} = \frac{1}{1 - \tilde{\mu}}. \end{aligned}$$

Ahora determinemos el segundo momento de $\tilde{\theta}(w)$, nuevamente consideremos la ecuación (36.81.11):

$$\begin{aligned} \tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right) &= 0 \\ \frac{\partial}{\partial w} \left\{ \tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right) \right\} &= 0 \\ \frac{\partial}{\partial w} \left\{ \frac{\partial}{\partial w} \left\{ \tilde{\theta}(w) - w\tilde{P}\left(\tilde{\theta}(w)\right) \right\} \right\} &= 0 \end{aligned}$$

$$
\begin{aligned}
& \frac{\partial}{\partial w}\left\{\frac{\partial}{\partial w}\tilde{\theta}(w)-\frac{\partial}{\partial w}\left[w\tilde{P}\left(\tilde{\theta}(w)\right)\right]\right\}=\frac{\partial}{\partial w}\left\{\frac{\partial}{\partial w}\tilde{\theta}(w)-\frac{\partial}{\partial w}\left[w\tilde{P}\left(\tilde{\theta}(w)\right)\right]\right\} \\
= & \frac{\partial}{\partial w}\left\{\frac{\partial\tilde{\theta}(w)}{\partial w}-\left[\tilde{P}\left(\tilde{\theta}(w)\right)+w\frac{\partial}{\partial w}R\left(\tilde{\theta}(w)\right)\right]\right\} \\
= & \frac{\partial}{\partial w}\left\{\frac{\partial\tilde{\theta}(w)}{\partial w}-\left[\tilde{P}\left(\tilde{\theta}(w)\right)+w\frac{\partial\tilde{P}\left(\tilde{\theta}(w)\right)}{\partial w}\frac{\partial\tilde{\theta}(w)}{\partial w}\right]\right\} \\
= & \frac{\partial}{\partial w}\left\{\tilde{\theta}^{(1)}(w)-\tilde{P}\left(\tilde{\theta}(w)\right)-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)\right\} \\
= & \frac{\partial}{\partial w}\tilde{\theta}^{(1)}(w)-\frac{\partial}{\partial w}\tilde{P}\left(\tilde{\theta}(w)\right)-\frac{\partial}{\partial w}\left[w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)\right]
\end{aligned}
$$

$$
\begin{aligned}
= & \frac{\partial}{\partial w}\tilde{\theta}^{(1)}(w)-\frac{\partial\tilde{P}\left(\tilde{\theta}(w)\right)}{\partial\tilde{\theta}(w)}\frac{\partial\tilde{\theta}(w)}{\partial w}-\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w) \\
- & w\frac{\partial\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}{\partial w}\tilde{\theta}^{(1)}(w)-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\frac{\partial\tilde{\theta}^{(1)}(w)}{\partial w} \\
= & \tilde{\theta}^{(2)}(w)-\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w)-\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w) \\
- & w\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)\left(\tilde{\theta}^{(1)}(w)\right)^2-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(2)}(w) \\
= & \tilde{\theta}^{(2)}(w)-2\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(1)}(w) \\
- & w\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)\left(\tilde{\theta}^{(1)}(w)\right)^2-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\tilde{\theta}^{(2)}(w) \\
= & \tilde{\theta}^{(2)}(w)\left[1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right]-\tilde{\theta}^{(1)}(w)\left[w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)+2\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right]
\end{aligned}
$$

luego

$$
\begin{aligned}
\tilde{\theta}^{(2)}(w)\left[1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right] & - \tilde{\theta}^{(1)}(w)\left[w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)+2\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)\right]=0 \\
\tilde{\theta}^{(2)}(w) & = \frac{\tilde{\theta}^{(1)}(w)\left[w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)+2R^{(1)}\left(\tilde{\theta}(w)\right)\right]}{1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)} \\
\tilde{\theta}^{(2)}(w) & = \frac{\tilde{\theta}^{(1)}(w)\,w\tilde{\theta}^{(1)}(w)\tilde{P}^{(2)}\left(\tilde{\theta}(w)\right)}{1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}+\frac{2\tilde{\theta}^{(1)}(w)\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}{1-w\tilde{P}^{(1)}\left(\tilde{\theta}(w)\right)}
\end{aligned}
$$

si evaluamos la expresión anterior en $w=1$:

$$
\begin{aligned}
\tilde{\theta}^{(2)}(1) & = \frac{\left(\tilde{\theta}^{(1)}(1)\right)^2\tilde{P}^{(2)}\left(\tilde{\theta}(1)\right)}{1-\tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)}+\frac{2\tilde{\theta}^{(1)}(1)\tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)}{1-\tilde{P}^{(1)}\left(\tilde{\theta}(1)\right)} \\
& = \frac{\left(\tilde{\theta}^{(1)}(1)\right)^2\tilde{P}^{(2)}(1)}{1-\tilde{P}^{(1)}(1)}+\frac{2\tilde{\theta}^{(1)}(1)\tilde{P}^{(1)}(1)}{1-\tilde{P}^{(1)}(1)} \\
& = \frac{\left(\frac{1}{1-\tilde{\mu}}\right)^2\tilde{P}^{(2)}(1)}{1-\tilde{\mu}}+\frac{2\left(\frac{1}{1-\tilde{\mu}}\right)\tilde{\mu}}{1-\tilde{\mu}}=\frac{\tilde{P}^{(2)}(1)}{(1-\tilde{\mu})^3}+\frac{2\tilde{\mu}}{(1-\tilde{\mu})^2}
\end{aligned}
$$

luego

$$
= \frac{\sigma^2-\tilde{\mu}+\tilde{\mu}^2}{(1-\tilde{\mu})^3}+\frac{2\tilde{\mu}}{(1-\tilde{\mu})^2}=\frac{\sigma^2-\tilde{\mu}+\tilde{\mu}^2+2\tilde{\mu}(1-\tilde{\mu})}{(1-\tilde{\mu})^3}
$$

es decir

$$
\begin{aligned}
\tilde{\theta}^{(2)}(1) & = \frac{\sigma^2+\tilde{\mu}-\tilde{\mu}^2}{(1-\tilde{\mu})^3}=\frac{\sigma^2}{(1-\tilde{\mu})^3}+\frac{\tilde{\mu}(1-\tilde{\mu})}{(1-\tilde{\mu})^3} \\
& = \frac{\sigma^2}{(1-\tilde{\mu})^3}+\frac{\tilde{\mu}}{(1-\tilde{\mu})^2}.
\end{aligned}
$$

Corolario 36.81.1 *El tiempo de ruina del jugador tiene primer y segundo momento dados por*

$$\mathbb{E}[T] = \frac{\mathbb{E}\left[\tilde{L}_0\right]}{1-\tilde{\mu}} \tag{36.81.12}$$

$$Var[T] = \frac{Var\left[\tilde{L}_0\right]}{(1-\tilde{\mu})^2} + \frac{\sigma^2\mathbb{E}\left[\tilde{L}_0\right]}{(1-\tilde{\mu})^3}. \tag{36.81.13}$$

36.82. Funciones Generadoras de Probabilidades

Para cada uno de los procesos de llegada a las colas $X_1, X_2, \hat{X}_1.\hat{X}_2$ y Y_2 anteriores se define su Función Generadora de Probabilidades (PGF):

$$\begin{aligned}
P_1(z_1) &= \mathbb{E}\left[z_1^{X_1(t)}\right], \\
P_2(z_2) &= \mathbb{E}\left[z_2^{X_2(t)}\right], \\
\check{P}_2(z_2) &= \mathbb{E}\left[z_2^{Y_2(t)}\right], \\
\hat{P}_1(w_1) &= \mathbb{E}\left[w_1^{\hat{X}_1(t)}\right], \\
\hat{P}_2(w_2) &= \mathbb{E}\left[w_2^{\hat{X}_2(t)}\right].
\end{aligned}$$

entonces

$$\tilde{P}_2(z_2) = \mathbb{E}\left[z_2^{\tilde{X}_2(t)}\right]$$

Con primer momento definidos por

$$\begin{aligned}
\mu_1 &= \mathbb{E}[X_1(t)] = P_1^{(1)}(1), \\
\mu_2 &= \mathbb{E}[X_2(t)] = P_2^{(1)}(1), \\
\check{\mu}_2 &= \mathbb{E}[Y_2(t)] = \check{P}_2^{(1)}(1), \\
\hat{\mu}_1 &= \mathbb{E}\left[\hat{X}_1(t)\right] = \hat{P}_1^{(1)}(1), \\
\hat{\mu}_2 &= \mathbb{E}\left[\hat{X}_2(t)\right] = \hat{P}_2^{(1)}(1), \\
\tilde{\mu}_2 &= \mathbb{E}\left[\tilde{X}_2(t)\right] = \tilde{P}_2^{(1)}(1).
\end{aligned}$$

En lo que respecta al servidor, en términos de los tiempos de visita a cada una de las colas, se denotarán por $B_1(t), B_2(t)$ los procesos correspondientes a las variables aleatorias τ_1, τ_2 para Q_1, Q_2 respectivamente; y $\hat{B}_1(t), \hat{B}_2(t)$ con parámetros ζ_1, ζ_2 para $\hat{Q}_1, \hat{Q}_2$ del sistema 2. Y a los tiempos en que el servidor termina de atender en las colas $Q_1, Q_2, \hat{Q}_1, \hat{Q}_2$, se les denotará por $\overline{\tau}_1, \overline{\tau}_2, \overline{\zeta}_1, \overline{\zeta}_2$ respectivamente. Entonces, los tiempos de servicio están dados por las diferencias $\overline{\tau}_1 - \tau_1, \overline{\tau}_2 - \tau_2$ para Q_1, Q_2, y $\overline{\zeta}_1 - \zeta_1, \overline{\zeta}_2 - \zeta_2$ para $\hat{Q}_1, \hat{Q}_2$ respectivamente.

Sus procesos se definen por:

$$\begin{aligned}
S_1(z_1) &= \mathbb{E}\left[z_1^{\overline{\tau}_1-\tau_1}\right], \\
S_2(z_2) &= \mathbb{E}\left[z_1^{\overline{\tau}_2-\tau_2}\right], \\
\hat{S}_1(w_1) &= \mathbb{E}\left[w_1^{\overline{\zeta}_1-\zeta_1}\right], \\
\hat{S}_2(w_2) &= \mathbb{E}\left[w_2^{\overline{\zeta}_2-\zeta_2}\right],
\end{aligned}$$

con primer momento dado por:

$$\begin{aligned}
s_1 &= \mathbb{E}[\overline{\tau}_1 - \tau_1], \\
s_2 &= \mathbb{E}[\overline{\tau}_2 - \tau_2], \\
\hat{s}_1 &= \mathbb{E}\left[\overline{\zeta}_1 - \zeta_1\right], \\
\hat{s}_2 &= \mathbb{E}\left[\overline{\zeta}_2 - \zeta_2\right],
\end{aligned}$$

Análogamente los tiempos de traslado del servidor desde el momento en que termina de atender a una cola y llega a la siguiente para comenzar a dar servicio están dados por $\tau_2 - \overline{\tau}_1, \tau_1 - \overline{\tau}_2$ y $\zeta_2 - \overline{\zeta}_1, \zeta_1 - \overline{\zeta}_2$ para el sistema 1 y el sistema 2, respectivamente.

La FGP para estos tiempos de traslado están dados por

$$\begin{aligned} R_1(z_1) &= \mathbb{E}\left[z_1^{\tau_2-\overline{\tau}_1}\right], \\ R_2(z_2) &= \mathbb{E}\left[z_2^{\tau_1-\overline{\tau}_2}\right], \\ \hat{R}_1(w_1) &= \mathbb{E}\left[w_1^{\zeta_2-\overline{\zeta}_1}\right], \\ \hat{R}_2(w_2) &= \mathbb{E}\left[w_2^{\zeta_1-\overline{\zeta}_2}\right], \end{aligned}$$

y al igual que como se hizo con anterioridad

$$\begin{aligned} r_1 &= R_1^{(1)}(1) = \mathbb{E}\left[\tau_2 - \overline{\tau}_1\right], \\ r_2 &= R_2^{(1)}(1) = \mathbb{E}\left[\tau_1 - \overline{\tau}_2\right], \\ \hat{r}_1 &= \hat{R}_1^{(1)}(1) = \mathbb{E}\left[\zeta_2 - \overline{\zeta}_1\right], \\ \hat{r}_2 &= \hat{R}_2^{(1)}(1) = \mathbb{E}\left[\zeta_1 - \overline{\zeta}_2\right]. \end{aligned}$$

Se definen los procesos de conteo para el número de usuarios en cada una de las colas al tiempo t, $L_1(t), L_2(t)$, para $H_1(t), H_2(t)$ del sistema 1, respectivamente. Y para el segundo sistema, se tienen los procesos $\hat{L}_1(t), \hat{L}_2(t)$ para $\hat{H}_1(t), \hat{H}_2(t)$, respectivamente, es decir,

$$\begin{aligned} H_1(t) &= \mathbb{E}\left[z_1^{L_1(t)}\right], \\ H_2(t) &= \mathbb{E}\left[z_2^{L_2(t)}\right], \\ \hat{H}_1(t) &= \mathbb{E}\left[w_1^{\hat{L}_1(t)}\right], \\ \hat{H}_2(t) &= \mathbb{E}\left[w_2^{\hat{L}_2(t)}\right]. \end{aligned}$$

Por lo dicho anteriormente se tiene que el número de usuarios presentes en los tiempos $\overline{\tau}_1, \overline{\tau}_2, \overline{\zeta}_1, \overline{\zeta}_2$, es cero, es decir, $L_i(\overline{\tau_i}) = 0$, y $\hat{L}_i\left(\overline{\zeta_i}\right) = 0$ para i=1,2 para cada uno de los dos sistemas.

Para cada una de las colas en cada sistema, el número de usuarios al tiempo en que llega el servidor a dar servicio está dado por el número de usuarios presentes en la cola al tiempo $t = \tau_i, \zeta_i$, más el número de usuarios que llegan a la cola en el intervalo de tiempo $[\tau_i, \overline{\tau}_i], \left[\zeta_i, \overline{\zeta}_i\right]$, es decir

$$L_1(\overline{\tau}_1) = L_1(\tau_1) + X_1(\overline{\tau}_1 - \tau_1), \tag{36.82.1}$$

$$\hat{L}_1(\overline{\tau}_1) = \hat{L}_1(\tau_1) + \hat{X}_1(\overline{\tau}_1 - \tau_1), \tag{36.82.2}$$

$$\hat{L}_2(\overline{\tau}_1) = \hat{L}_2(\tau_1) + \hat{X}_2(\overline{\tau}_1 - \tau_1). \tag{36.82.3}$$

En el caso específico de Q_2, además, hay que considerar el número de usuarios que pasan del sistema 2 al sistema 1, a traves de $\hat{Q}_2$ mientras el servidor en Q_2 está ausente, es decir:

$$L_2(\overline{\tau}_1) = L_2(\tau_1) + X_2(\overline{\tau}_1 - \tau_1) + Y_2(\overline{\tau}_1 - \tau_1). \tag{36.82.4}$$

Ahora, determinemos la distribución del número de usuarios que pasan de $\hat{Q}_2$ a Q_2 considerando dos políticas de traslado en específico:

1. Solamente pasa un usuario,
2. Se permite el paso de k usuarios,

una vez que son atendidos por el servidor en $\hat{Q}_2$.

Política de un solo usuario: Sea R_2 el número de usuarios que llegan a $\hat{Q}_2$ al tiempo t, sea R_1 el número de usuarios que pasan de $\hat{Q}_2$ a Q_2 al tiempo t.

A saber:

$$\begin{aligned}\mathbb{E}[R_1] &= \sum_{y\geq 0}\mathbb{P}[R_2=y]\,\mathbb{E}[R_1|R_2=y]\\ &= \sum_{y\geq 0}\mathbb{P}[R_2=y]\sum_{x\geq 0}x\mathbb{P}[R_1=x|R_2=y]\\ &= \sum_{y\geq 0}\sum_{x\geq 0}x\mathbb{P}[R_1=x|R_2=y]\,\mathbb{P}[R_2=y].\end{aligned}$$

Determinemos

$$\mathbb{E}[R_1|R_2=y]=\sum_{x\geq 0}x\mathbb{P}[R_1=x|R_2=y]. \tag{36.82.5}$$

supongamos que $y=0$, entonces

$$\begin{aligned}\mathbb{P}[R_1=0|R_2=0] &= 1,\\ \mathbb{P}[R_1=x|R_2=0] &= 0,\ \text{para cualquier } x\geq 1,\end{aligned}$$

por tanto

$$\mathbb{E}[R_1|R_2=0]=0.$$

Para $y=1$,

$$\begin{aligned}\mathbb{P}[R_1=0|R_2=1] &= 0,\\ \mathbb{P}[R_1=1|R_2=1] &= 1,\end{aligned}$$

entonces

$$\mathbb{E}[R_1|R_2=1]=1.$$

Para $y>1$:

$$\begin{aligned}\mathbb{P}[R_1=0|R_2\geq 1] &= 0,\\ \mathbb{P}[R_1=1|R_2\geq 1] &= 1,\\ \mathbb{P}[R_1>1|R_2\geq 1] &= 0,\end{aligned}$$

entonces

$$\mathbb{E}[R_1|R_2=y]=1,\ \text{para cualquier } y>1.$$

es decir

$$\mathbb{E}[R_1|R_2=y]=1,\ \text{para cualquier } y\geq 1.$$

Entonces

$$\begin{aligned}\mathbb{E}[R_1] &= \sum_{y\geq 0}\sum_{x\geq 0}x\mathbb{P}[R_1=x|R_2=y]\,\mathbb{P}[R_2=y]=\sum_{y\geq 0}\sum_{x}\mathbb{E}[R_1|R_2=y]\,\mathbb{P}[R_2=y]\\ &= \sum_{y\geq 0}\mathbb{P}[R_2=y]=\sum_{y\geq 1}\frac{(\lambda t)^k}{k!}e^{-\lambda t}=1.\end{aligned}$$

Además para $k\in Z^+$

$$\begin{aligned}f_{R_1}(k) &= \mathbb{P}[R_1=k]=\sum_{n=0}^{\infty}\mathbb{P}[R_1=k|R_2=n]\,\mathbb{P}[R_2=n]\\ &= \mathbb{P}[R_1=k|R_2=0]\,\mathbb{P}[R_2=0]+\mathbb{P}[R_1=k|R_2=1]\,\mathbb{P}[R_2=1]\\ &+ \mathbb{P}[R_1=k|R_2>1]\,\mathbb{P}[R_2>1],\end{aligned}$$

donde para

$k=0$**:**

$$\begin{aligned}\mathbb{P}[R_1=0]=\mathbb{P}[R_1=0|R_2=0]\,\mathbb{P}[R_2=0]+\mathbb{P}[R_1=0|R_2=1]\,\mathbb{P}[R_2=1]\\ +\mathbb{P}[R_1=0|R_2>1]\,\mathbb{P}[R_2>1]=\mathbb{P}[R_2=0].\end{aligned}$$

$k=1$**:**

$$\begin{aligned}\mathbb{P}[R_1=1]=\mathbb{P}[R_1=1|R_2=0]\,\mathbb{P}[R_2=0]+\mathbb{P}[R_1=1|R_2=1]\,\mathbb{P}[R_2=1]\\ +\mathbb{P}[R_1=1|R_2>1]\,\mathbb{P}[R_2>1]=\sum_{n=1}^{\infty}\mathbb{P}[R_2=n].\end{aligned}$$

$k = 2$**:**

$$\mathbb{P}[R_1 = 2] = \mathbb{P}[R_1 = 2|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = 2|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = 2|R_2 > 1]\,\mathbb{P}[R_2 > 1] = 0.$$

$k = j$**:**

$$\mathbb{P}[R_1 = j] = \mathbb{P}[R_1 = j|R_2 = 0]\,\mathbb{P}[R_2 = 0] + \mathbb{P}[R_1 = j|R_2 = 1]\,\mathbb{P}[R_2 = 1] \\ +\mathbb{P}[R_1 = j|R_2 > 1]\,\mathbb{P}[R_2 > 1] = 0.$$

Por lo tanto

$$\begin{aligned} f_{R_1}(0) &= \mathbb{P}[R_2 = 0] \\ f_{R_1}(1) &= \sum_{n\geq 1}^{\infty} \mathbb{P}[R_2 = n] \\ f_{R_1}(j) &= 0, \text{ para } j > 1. \end{aligned}$$

Política de k usuarios: Al igual que antes, para $y \in Z^+$ fijo

$$\mathbb{E}[R_1|R_2 = y] = \sum_x x\mathbb{P}[R_1 = x|R_2 = y].$$

Entonces, si tomamos diversos valore para y:

$y = 0$:

$$\begin{aligned} \mathbb{P}[R_1 = 0|R_2 = 0] &= 1, \\ \mathbb{P}[R_1 = x|R_2 = 0] &= 0, \text{ para cualquier } x \geq 1, \end{aligned}$$

entonces

$$\mathbb{E}[R_1|R_2 = 0] = 0.$$

Para $y = 1$,

$$\begin{aligned} \mathbb{P}[R_1 = 0|R_2 = 1] &= 0, \\ \mathbb{P}[R_1 = 1|R_2 = 1] &= 1, \end{aligned}$$

entonces

$$\mathbb{E}[R_1|R_2 = 1] = 1.$$

Para $y = 2$,

$$\begin{aligned} \mathbb{P}[R_1 = 0|R_2 = 2] &= 0, \\ \mathbb{P}[R_1 = 1|R_2 = 2] &= 1, \\ \mathbb{P}[R_1 = 2|R_2 = 2] &= 1, \\ \mathbb{P}[R_1 = 3|R_2 = 2] &= 0, \end{aligned}$$

entonces

$$\mathbb{E}[R_1|R_2 = 2] = 3.$$

Para $y = 3$,

$$\begin{aligned} \mathbb{P}[R_1 = 0|R_2 = 3] &= 0, \\ \mathbb{P}[R_1 = 1|R_2 = 3] &= 1, \\ \mathbb{P}[R_1 = 2|R_2 = 3] &= 1, \\ \mathbb{P}[R_1 = 3|R_2 = 3] &= 1, \\ \mathbb{P}[R_1 = 4|R_2 = 3] &= 0, \end{aligned}$$

entonces

$$\mathbb{E}[R_1|R_2 = 3] = 6.$$

En general, para $k \geq 0$,

$$\begin{aligned} \mathbb{P}[R_1 = 0|R_2 = k] &= 0, \\ \mathbb{P}[R_1 = j|R_2 = k] &= 1, \text{ para } 1 \leq j \leq k, \\ \mathbb{P}[R_1 = j|R_2 = k] &= 0, \text{ para } j > k, \end{aligned}$$

entonces

$$\mathbb{E}\left[R_1|R_2=k\right]=\frac{k\left(k+1\right)}{2}.$$

Por lo tanto

$$\begin{aligned}
\mathbb{E}\left[R_1\right] &= \sum_{y}\mathbb{E}\left[R_1|R_2=y\right]\mathbb{P}\left[R_2=y\right] \\
&= \sum_{y}\mathbb{P}\left[R_2=y\right]\frac{y\left(y+1\right)}{2}=\sum_{y\geq 1}\left(\frac{y\left(y+1\right)}{2}\right)\frac{\left(\lambda t\right)^{y}}{y!}e^{-\lambda t} \\
&= \frac{\lambda t}{2}e^{-\lambda t}\sum_{y\geq 1}\left(y+1\right)\frac{\left(\lambda t\right)^{y-1}}{\left(y-1\right)!}=\frac{\lambda t}{2}e^{-\lambda t}\left(e^{\lambda t}\left(\lambda t+2\right)\right) \\
&= \frac{\lambda t\left(\lambda t+2\right)}{2},
\end{aligned}$$

es decir,

$$\mathbb{E}\left[R_1\right]=\frac{\lambda t\left(\lambda t+2\right)}{2}. \tag{36.82.6}$$

Además para $k\in Z^{+}$ fijo

$$\begin{aligned}
f_{R_1}\left(k\right) &= \mathbb{P}\left[R_1=k\right]=\sum_{n=0}^{\infty}\mathbb{P}\left[R_1=k|R_2=n\right]\mathbb{P}\left[R_2=n\right] \\
&= \mathbb{P}\left[R_1=k|R_2=0\right]\mathbb{P}\left[R_2=0\right]+\mathbb{P}\left[R_1=k|R_2=1\right]\mathbb{P}\left[R_2=1\right] \\
&+ \mathbb{P}\left[R_1=k|R_2=2\right]\mathbb{P}\left[R_2=2\right]+\cdots+\mathbb{P}\left[R_1=k|R_2=j\right]\mathbb{P}\left[R_2=j\right]+\cdots+
\end{aligned}$$

donde para

$k=0$**:**

$$\begin{aligned}
\mathbb{P}\left[R_1=0\right]=\mathbb{P}\left[R_1=0|R_2=0\right]\mathbb{P}\left[R_2=0\right]+\mathbb{P}\left[R_1=0|R_2=1\right]\mathbb{P}\left[R_2=1\right] \\
+\mathbb{P}\left[R_1=0|R_2=j\right]\mathbb{P}\left[R_2=j\right]=\mathbb{P}\left[R_2=0\right].
\end{aligned}$$

$k=1$**:**

$$\begin{aligned}
\mathbb{P}\left[R_1=1\right]=\mathbb{P}\left[R_1=1|R_2=0\right]\mathbb{P}\left[R_2=0\right]+\mathbb{P}\left[R_1=1|R_2=1\right]\mathbb{P}\left[R_2=1\right] \\
+\mathbb{P}\left[R_1=1|R_2=1\right]\mathbb{P}\left[R_2=1\right]+\cdots+\mathbb{P}\left[R_1=1|R_2=j\right]\mathbb{P}\left[R_2=j\right] \\
=\sum_{n=1}^{\infty}\mathbb{P}\left[R_2=n\right].
\end{aligned}$$

$k=2$**:**

$$\begin{aligned}
\mathbb{P}\left[R_1=2\right]=\mathbb{P}\left[R_1=2|R_2=0\right]\mathbb{P}\left[R_2=0\right]+\mathbb{P}\left[R_1=2|R_2=1\right]\mathbb{P}\left[R_2=1\right] \\
+\mathbb{P}\left[R_1=2|R_2=2\right]\mathbb{P}\left[R_2=2\right]+\cdots+\mathbb{P}\left[R_1=2|R_2=j\right]\mathbb{P}\left[R_2=j\right] \\
=\sum_{n=2}^{\infty}\mathbb{P}\left[R_2=n\right].
\end{aligned}$$

En general

$$\begin{aligned}
\mathbb{P}\left[R_1=k\right]=\mathbb{P}\left[R_1=k|R_2=0\right]\mathbb{P}\left[R_2=0\right]+\mathbb{P}\left[R_1=k|R_2=1\right]\mathbb{P}\left[R_2=1\right] \\
+\mathbb{P}\left[R_1=k|R_2=2\right]\mathbb{P}\left[R_2=2\right]+\cdots+\mathbb{P}\left[R_1=k|R_2=k\right]\mathbb{P}\left[R_2=k\right] \\
=\sum_{n=k}^{\infty}\mathbb{P}\left[R_2=n\right].
\end{aligned}$$

Por lo tanto

$$f_{R_1}\left(k\right) = \mathbb{P}\left[R_1=k\right]=\sum_{n=k}^{\infty}\mathbb{P}\left[R_2=n\right].$$

36.83. Descripción de una Red de S.V.C.

Se definen los procesos de llegada de los usuarios a cada una de las colas dependiendo de la llegada del servidor pero del sistema al cuál no pertenece la cola en cuestión:

Para el sistema 1 y el servidor del segundo sistema

$$\begin{aligned}
F_{1,1}(z_1;\zeta_1) &= \mathbb{E}\left[z_1^{L_1(\zeta_1)}\right] = \sum_{k=0}^{\infty}\mathbb{P}\left[L_1(\zeta_1)=k\right]z_1^k \\
F_{2,1}(z_2;\zeta_1) &= \mathbb{E}\left[z_2^{L_2(\zeta_1)}\right] = \sum_{k=0}^{\infty}\mathbb{P}\left[L_2(\zeta_1)=k\right]z_2^k \\
F_{1,2}(z_1;\zeta_2) &= \mathbb{E}\left[z_1^{L_1(\zeta_2)}\right] = \sum_{k=0}^{\infty}\mathbb{P}\left[L_1(\zeta_2)=k\right]z_1^k \\
F_{2,2}(z_2;\zeta_2) &= \mathbb{E}\left[z_2^{L_2(\zeta_2)}\right] = \sum_{k=0}^{\infty}\mathbb{P}\left[L_2(\zeta_2)=k\right]z_2^k
\end{aligned}$$

Ahora se definen para el segundo sistema y el servidor del primero

$$\begin{aligned}
\hat{F}_{1,1}(w_1;\tau_1) &= \mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}\right] = \sum_{k=0}^{\infty}\mathbb{P}\left[\hat{L}_1(\tau_1)=k\right]w_1^k \\
\hat{F}_{2,1}(w_2;\tau_1) &= \mathbb{E}\left[w_2^{\hat{L}_2(\tau_1)}\right] = \sum_{k=0}^{\infty}\mathbb{P}\left[\hat{L}_2(\tau_1)=k\right]w_2^k \\
\hat{F}_{1,2}(w_1;\tau_2) &= \mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)}\right] = \sum_{k=0}^{\infty}\mathbb{P}\left[\hat{L}_1(\tau_2)=k\right]w_1^k \\
\hat{F}_{2,2}(w_2;\tau_2) &= \mathbb{E}\left[w_2^{\hat{L}_2(\tau_2)}\right] = \sum_{k=0}^{\infty}\mathbb{P}\left[\hat{L}_2(\tau_2)=k\right]w_2^k
\end{aligned}$$

Ahora, con lo anterior definamos la FGP conjunta para el segundo sistema y τ_1:

$$\begin{aligned}
\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right] &= \mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}\right]\mathbb{E}\left[w_2^{\hat{L}_2(\tau_1)}\right] = \hat{F}_{1,1}(w_1;\tau_1)\,\hat{F}_{2,1}(w_2;\tau_1) \\
&= \hat{F}_1(w_1,w_2;\tau_1).
\end{aligned}$$

hagamos lo mismo para τ_2

$$\begin{aligned}
\mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)}w_2^{\hat{L}_2(\tau_2)}\right] &= \mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)}\right]\mathbb{E}\left[w_2^{\hat{L}_2(\tau_2)}\right] = \hat{F}_{1,2}(w_1;\tau_2)\,\hat{F}_{2,2}(w_2;\tau_2) \\
&= \hat{F}_2(w_1,w_2;\tau_2).
\end{aligned}$$

Con respecto al sistema 1 se tiene la FGP conjunta con respecto a ζ_1:

$$\begin{aligned}
\mathbb{E}\left[z_1^{L_1(\zeta_1)}z_2^{L_2(\zeta_1)}\right] &= \mathbb{E}\left[z_1^{L_1(\zeta_1)}\right]\mathbb{E}\left[z_2^{L_2(\zeta_1)}\right] = F_{1,1}(z_1;\zeta_1)\,F_{2,1}(z_2;\zeta_1) \\
&= F_1(z_1,z_2;\zeta_1).
\end{aligned}$$

Finalmente

$$\begin{aligned}
\mathbb{E}\left[z_1^{L_1(\zeta_2)}z_2^{L_2(\zeta_2)}\right] &= \mathbb{E}\left[z_1^{L_1(\zeta_2)}\right]\mathbb{E}\left[z_2^{L_2(\zeta_2)}\right] = F_{1,2}(z_1;\zeta_2)\,F_{2,2}(z_2;\zeta_2) \\
&= F_2(z_1,z_2;\zeta_2).
\end{aligned}$$

Ahora analicemos la Red de Sistemas de Visitas Cíclicas, entonces se define la PGF conjunta al tiempo t para los tiempos de visita del servidor en cada una de las colas, para comenzar a dar servicio, definidos anteriormente al tiempo $t=\{\tau_1,\tau_2,\zeta_1,\zeta_2\}$:

$$F_1(z_1,z_2,w_1,w_2) = \mathbb{E}\left[z_1^{L_1(\tau_1)}z_2^{L_2(\tau_1)}w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right] \tag{36.83.1}$$

$$F_2(z_1,z_2,w_1,w_2) = \mathbb{E}\left[z_1^{L_1(\tau_2)}z_2^{L_2(\tau_2)}w_1^{\hat{L}_1(\tau_2)}w_2^{\hat{L}_2(\tau_2)}\right] \tag{36.83.2}$$

$$\hat{F}_1(z_1,z_2,w_1,w_2) = \mathbb{E}\left[z_1^{L_1(\zeta_1)}z_2^{L_2(\zeta_1)}w_1^{\hat{L}_1(\zeta_1)}w_2^{\hat{L}_2(\zeta_1)}\right] \tag{36.83.3}$$

$$\hat{F}_2(z_1,z_2,w_1,w_2) = \mathbb{E}\left[z_1^{L_1(\zeta_2)}z_2^{L_2(\zeta_2)}w_1^{\hat{L}_1(\zeta_2)}w_2^{\hat{L}_2(\zeta_2)}\right] \tag{36.83.4}$$

Entonces, con la finalidad de encontrar el número de usuarios presentes en el sistema cuando el servidor deja de atender una de las colas de cualquier sistema se tiene lo siguiente

$$\begin{aligned}
& \mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)} z_2^{L_2(\overline{\tau}_1)} w_1^{\hat{L}_1(\overline{\tau}_1)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right] = \mathbb{E}\left[z_2^{L_2(\overline{\tau}_1)} w_1^{\hat{L}_1(\overline{\tau}_1)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right] \\
= \quad & \mathbb{E}\left[z_2^{L_2(\tau_1)+X_2(\overline{\tau}_1-\tau_1)+Y_2(\overline{\tau}_1-\tau_1)} w_1^{\hat{L}_1(\tau_1)+\hat{X}_1(\overline{\tau}_1-\tau_1)} w_2^{\hat{L}_2(\tau_1)+\hat{X}_2(\overline{\tau}_1-\tau_1)}\right]
\end{aligned}$$

utilizando la ecuacion dada (36.82.1), luego

$$\begin{aligned}
= \quad & \mathbb{E}\left[z_2^{L_2(\tau_1)} z_2^{X_2(\overline{\tau}_1-\tau_1)} z_2^{Y_2(\overline{\tau}_1-\tau_1)} w_1^{\hat{L}_1(\tau_1)} w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)} w_2^{\hat{L}_2(\tau_1)} w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right] \\
= \quad & \mathbb{E}\left[z_2^{L_2(\tau_1)} \left\{w_1^{\hat{L}_1(\tau_1)} w_2^{\hat{L}_2(\tau_1)}\right\} \left\{z_2^{X_2(\overline{\tau}_1-\tau_1)} z_2^{Y_2(\overline{\tau}_1-\tau_1)} w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)} w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right]
\end{aligned}$$

Aplicando la ecuación (36.81.1)

$$= \quad \mathbb{E}\left[z_2^{L_2(\tau_1)} \left\{z_2^{X_2(\overline{\tau}_1-\tau_1)} z_2^{Y_2(\overline{\tau}_1-\tau_1)} w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)} w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)} w_2^{\hat{L}_2(\tau_1)}\right]$$

dado que los arribos a cada una de las colas son independientes, podemos separar la esperanza para los procesos de llegada a Q_1 y Q_2 en τ_1

Recordando que $\tilde{X}_2(z_2) = X_2(z_2) + Y_2(z_2)$ se tiene

$$\begin{aligned}
= \quad & \mathbb{E}\left[z_2^{L_2(\tau_1)} \left\{z_2^{\tilde{X}_2(\overline{\tau}_1-\tau_1)} w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)} w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)} w_2^{\hat{L}_2(\tau_1)}\right] \\
= \quad & \mathbb{E}\left[z_2^{L_2(\tau_1)} \left\{\tilde{P}_2(z_2)^{\overline{\tau}_1-\tau_1} \hat{P}_1(w_1)^{\overline{\tau}_1-\tau_1} \hat{P}_2(w_2)^{\overline{\tau}_1-\tau_1}\right\}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)} w_2^{\hat{L}_2(\tau_1)}\right] \\
= \quad & \mathbb{E}\left[z_2^{L_2(\tau_1)} \left\{\tilde{P}_2(z_2) \hat{P}_1(w_1) \hat{P}_2(w_2)\right\}^{\overline{\tau}_1-\tau_1}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)} w_2^{\hat{L}_2(\tau_1)}\right]
\end{aligned}$$

Entonces

$$\begin{aligned}
= \quad & \mathbb{E}\left[z_2^{L_2(\tau_1)} \theta_1\left(\tilde{P}_2(z_2) \hat{P}_1(w_1) \hat{P}_2(w_2)\right)^{L_1(\tau_1)}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)} w_2^{\hat{L}_2(\tau_1)}\right] \\
= \quad & F_1\left(\theta_1\left(\tilde{P}_2(z_2) \hat{P}_1(w_1) \hat{P}_2(w_2)\right), z2\right) \hat{F}_1(w_1, w_2; \tau_1) \\
\equiv \quad & F_1\left(\theta_1\left(\tilde{P}_2(z_2) \hat{P}_1(w_1) \hat{P}_2(w_2)\right), z_2, w_1, w_2\right)
\end{aligned}$$

Las igualdades anteriores son ciertas pues el número de usuarios que llegan a $\hat{Q}_2$ durante el intervalo $[\tau_1, \overline{\tau}_1]$ aún no han sido atendidos por el servidor del sistema 2 y por tanto aún no pueden pasar al sistema 1 por Q_2. Por tanto el número de usuarios que pasan de $\hat{Q}_2$ a Q_2 en el intervalo de tiempo $[\tau_1, \overline{\tau}_1]$ depende de la política de traslado entre los dos sistemas, conforme a la sección anterior.

Por lo tanto

$$\mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)} z_2^{L_2(\overline{\tau}_1)} w_1^{\hat{L}_1(\overline{\tau}_1)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right] = F_1\left(\theta_1\left(\tilde{P}_2(z_2) \hat{P}_1(w_1) \hat{P}_2(w_2)\right), z_2, w_1, w_2\right) \tag{36.83.5}$$

Utilizando un razonamiento análogo para $\overline{\tau}_2$:

$$\begin{aligned}
& \mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)} z_2^{L_2(\overline{\tau}_2)} w_1^{\hat{L}_1(\overline{\tau}_2)} w_2^{\hat{L}_2(\overline{\tau}_2)}\right] = \mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)} w_1^{\hat{L}_1(\overline{\tau}_2)} w_2^{\hat{L}_2(\overline{\tau}_2)}\right] \\
= \quad & \mathbb{E}\left[z_1^{L_1(\tau_2)+X_1(\overline{\tau}_2-\tau_2)} w_1^{\hat{L}_1(\tau_2)+\hat{X}_1(\overline{\tau}_2-\tau_2)} w_2^{\hat{L}_2(\tau_2)+\hat{X}_2(\overline{\tau}_2-\tau_2)}\right] \\
= \quad & \mathbb{E}\left[z_1^{L_1(\tau_2)} z_1^{X_1(\overline{\tau}_2-\tau_2)} w_1^{\hat{L}_1(\tau_2)} w_1^{\hat{X}_1(\overline{\tau}_2-\tau_2)} w_2^{\hat{L}_2(\tau_2)} w_2^{\hat{X}_2(\overline{\tau}_2-\tau_2)}\right] \\
= \quad & \mathbb{E}\left[z_1^{L_1(\tau_2)} z_1^{X_1(\overline{\tau}_2-\tau_2)} w_1^{\hat{X}_1(\overline{\tau}_2-\tau_2)} w_2^{\hat{X}_2(\overline{\tau}_2-\tau_2)}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)} w_2^{\hat{L}_2(\tau_2)}\right] \\
= \quad & \mathbb{E}\left[z_1^{L_1(\tau_2)} P_1(z_1)^{\overline{\tau}_2-\tau_2} \hat{P}_1(w_1)^{\overline{\tau}_2-\tau_2} \hat{P}_2(w_2)^{\overline{\tau}_2-\tau_2}\right] \mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)} w_2^{\hat{L}_2(\tau_2)}\right]
\end{aligned}$$

utlizando la proposición relacionada con la ruina del jugador

$$
\begin{aligned}
&= \mathbb{E}\left[z_1^{L_1(\tau_2)}\left\{P_1(z_1)\hat{P}_1(w_1)\hat{P}_2(w_2)\right\}^{\overline{\tau}_2-\tau_2}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)}w_2^{\hat{L}_2(\tau_2)}\right]\\
&= \mathbb{E}\left[z_1^{L_1(\tau_2)}\tilde{\theta}_2\left(P_1(z_1)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)^{L_2(\tau_2)}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_2)}w_2^{\hat{L}_2(\tau_2)}\right]\\
&= F_2\left(z_1,\tilde{\theta}_2\left(P_1(z_1)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)\right)\hat{F}_2(w_1,w_2;\tau_2)
\end{aligned}
$$

entonces se define

$$
\mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)}z_2^{L_2(\overline{\tau}_2)}w_1^{\hat{L}_1(\overline{\tau}_2)}w_2^{\hat{L}_2(\overline{\tau}_2)}\right] = F_2\left(z_1,\tilde{\theta}_2\left(P_1(z_1)\hat{P}_1(w_1)\hat{P}_2(w_2)\right),w_1,w_2\right) \tag{36.83.6}
$$

$$
\equiv F_2\left(z_1,\tilde{\theta}_2\left(P_1(z_1)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)\right)\hat{F}_2(w_1,w_2;\tau_2) \tag{36.83.7}
$$

Ahora para $\overline{\zeta}_1$:

$$
\begin{aligned}
&\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)}z_2^{L_2(\overline{\zeta}_1)}w_1^{\hat{L}_1(\overline{\zeta}_1)}w_2^{\hat{L}_2(\overline{\zeta}_1)}\right] = \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)}z_2^{L_2(\overline{\zeta}_1)}w_2^{\hat{L}_2(\overline{\zeta}_1)}\right]\\
&= \mathbb{E}\left[z_1^{L_1(\zeta_1)}z_1^{X_1(\overline{\zeta}_1-\zeta_1)}z_2^{L_2(\zeta_1)}z_2^{X_2(\overline{\zeta}_1-\zeta_1)}z_2^{Y_2(\overline{\zeta}_1-\zeta_1)}w_2^{\hat{L}_2(\zeta_1)}w_2^{\hat{X}_2(\overline{\zeta}_1-\zeta_1)}\right]\\
&= \mathbb{E}\left[z_1^{L_1(\zeta_1)}z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[z_1^{X_1(\overline{\zeta}_1-\zeta_1)}z_2^{\tilde{X}_2(\overline{\zeta}_1-\zeta_1)}w_2^{\hat{X}_2(\overline{\zeta}_1-\zeta_1)}w_2^{\hat{L}_2(\zeta_1)}\right]\\
&= \mathbb{E}\left[z_1^{L_1(\zeta_1)}z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[P_1(z_1)^{\overline{\zeta}_1-\zeta_1}\tilde{P}_2(z_2)^{\overline{\zeta}_1-\zeta_1}\hat{P}_2(w_2)^{\overline{\zeta}_1-\zeta_1}w_2^{\hat{L}_2(\zeta_1)}\right]\\
&= \mathbb{E}\left[z_1^{L_1(\zeta_1)}z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[\left\{P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right\}^{\overline{\zeta}_1-\zeta_1}w_2^{\hat{L}_2(\zeta_1)}\right]\\
&= \mathbb{E}\left[z_1^{L_1(\zeta_1)}z_2^{L_2(\zeta_1)}\right]\mathbb{E}\left[\hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right)^{\hat{L}_1(\zeta_1)}w_2^{\hat{L}_2(\zeta_1)}\right]\\
&= F_1(z_1,z_2;\zeta_1)\hat{F}_1\left(\hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right),w_2\right)
\end{aligned}
$$

es decir

$$
\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)}z_2^{L_2(\overline{\zeta}_1)}w_1^{\hat{L}_1(\overline{\zeta}_1)}w_2^{\hat{L}_2(\overline{\zeta}_1)}\right] = \hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right),w_2\right) \tag{3}
$$

$$
= F_1(z_1,z_2;\zeta_1)\hat{F}_1\left(\hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right)\right) \tag{3}
$$

Finalmente para $\overline{\zeta}_2$:

$$
\begin{aligned}
&\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)}z_2^{L_2(\overline{\zeta}_2)}w_1^{\hat{L}_1(\overline{\zeta}_2)}w_2^{\hat{L}_2(\overline{\zeta}_2)}\right] = \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)}z_2^{L_2(\overline{\zeta}_2)}w_1^{\hat{L}_1(\overline{\zeta}_2)}\right]\\
&= \mathbb{E}\left[z_1^{L_1(\zeta_2)}z_1^{X_1(\overline{\zeta}_2-\zeta_2)}z_2^{L_2(\zeta_2)}z_2^{X_2(\overline{\zeta}_2-\zeta_2)}z_2^{Y_2(\overline{\zeta}_2-\zeta_2)}w_1^{\hat{L}_1(\zeta_2)}w_1^{\hat{X}_1(\overline{\zeta}_2-\zeta_2)}\right]\\
&= \mathbb{E}\left[z_1^{L_1(\zeta_2)}z_2^{L_2(\zeta_2)}\right]\mathbb{E}\left[z_1^{X_1(\overline{\zeta}_2-\zeta_2)}z_2^{\tilde{X}_2(\overline{\zeta}_2-\zeta_2)}w_1^{\hat{X}_1(\overline{\zeta}_2-\zeta_2)}w_1^{\hat{L}_1(\zeta_2)}\right]\\
&= \mathbb{E}\left[z_1^{L_1(\zeta_2)}z_2^{L_2(\zeta_2)}\right]\mathbb{E}\left[P_1(z_1)^{\overline{\zeta}_2-\zeta_2}\tilde{P}_2(z_2)^{\overline{\zeta}_2-\zeta_2}\hat{P}(w_1)^{\overline{\zeta}_2-\zeta_2}w_1^{\hat{L}_1(\zeta_2)}\right]\\
&= \mathbb{E}\left[z_1^{L_1(\zeta_2)}z_2^{L_2(\zeta_2)}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\zeta_2)}\left\{P_1(z_1)\tilde{P}_2(z_2)\hat{P}(w_1)\right\}^{\overline{\zeta}_2-\zeta_2}\right]\\
&= \mathbb{E}\left[z_1^{L_1(\zeta_2)}z_2^{L_2(\zeta_2)}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\zeta_2)}\hat{\theta}_2\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}(w_1)\right)^{\hat{L}_2\zeta_2}\right]\\
&= F_2(z_1,z_2;\zeta_2)\hat{F}_2\left(w_1,\hat{\theta}_2\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\right)\right]
\end{aligned}
$$

36.84. Ecuaciones Recursivas para la R.S.V.C.

es decir

$$
\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)}z_2^{L_2(\overline{\zeta}_2)}w_1^{\hat{L}_1(\overline{\zeta}_2)}w_2^{\hat{L}_2(\overline{\zeta}_2)}\right] = \hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\right)\right) \tag{36.84.1}
$$

$$
= F_2(z_1,z_2;\zeta_2)\hat{F}_2\left(w_1,\hat{\theta}_2\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\right)\right] \tag{36.84.2}
$$

$$
\tag{36.84.3}
$$

Con lo desarrollado hasta ahora podemos encontrar las ecuaciones recursivas que modelan la Red de Sistemas de Visitas Cíclicas (R.S.V.C):

$$F_2(z_1,z_2,w_1,w_2) = R_1(z_1,z_2,w_1,w_2)\,\mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)} z_2^{L_2(\overline{\tau}_1)} w_1^{\hat{L}_1(\overline{\tau}_1)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right]$$
$$F_1(z_1,z_2,w_1,w_2) = R_2(z_1,z_2,w_1,w_2)\,\mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)} z_2^{L_2(\overline{\tau}_2)} w_1^{\hat{L}_1(\overline{\tau}_2)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right]$$
$$\hat{F}_2(z_1,z_2,w_1,w_2) = \hat{R}_1(z_1,z_2,w_1,w_2)\,\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)} z_2^{L_2(\overline{\zeta}_1)} w_1^{\hat{L}_1(\overline{\zeta}_1)} w_2^{\hat{L}_2(\overline{\zeta}_1)}\right]$$

y finalmente

$$\hat{F}_1(z_1,z_2,w_1,w_2) = \hat{R}_2(z_1,z_2,w_1,w_2)\,\mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)} w_2^{\hat{L}_2(\overline{\zeta}_2)}\right]$$

que son equivalentes a las siguientes ecuaciones

$$\begin{aligned} F_2(z_1,z_2,w_1,w_2) &= R_1\left(P_1(z_1)\,\tilde{P}_2(z_2)\prod_{i=1}^{2}\hat{P}_i(w_i)\right) \\ & \quad F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right) \end{aligned}$$

$$\begin{aligned} F_1(z_1,z_2,w_1,w_2) &= R_2\left(P_1(z_1)\,\tilde{P}_2(z_2)\prod_{i=1}^{2}\hat{P}_i(w_i)\right) \\ & \quad F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), w_1, w_2\right) \end{aligned}$$

36.84.1. Tiempos de Traslado del Servidor

$$\begin{aligned} \hat{F}_2(z_1,z_2,w_1,w_2) &= \hat{R}_1\left(P_1(z_1)\,\tilde{P}_2(z_2)\prod_{i=1}^{2}\hat{P}_i(w_i)\right) \\ & \quad \hat{F}_1\left(z_1, z_2, \hat{\theta}_1\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_2(w_2)\right), w_2\right) \end{aligned}$$

$$\begin{aligned} \hat{F}_1(z_1,z_2,w_1,w_2) &= \hat{R}_2\left(P_1(z_1)\,\tilde{P}_2(z_2)\prod_{i=1}^{2}\hat{P}_i(w_i)\right) \\ & \quad \hat{F}_2\left(z_1, z_2, w_1, \hat{\theta}_2\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\right)\right) \end{aligned}$$

Para

$$R_1(\mathbf{z},\mathbf{w}) = R_1\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right) \tag{36.84.4}$$

se tiene que

$$\begin{aligned} \frac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= R_1^{(1)}(1)\,P_1^{(1)}(1) = r_1\mu_1, \\ \frac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= R_1^{(1)}(1)\,\tilde{P}_2^{(1)}(1) = r_1\tilde{\mu}_2, \\ \frac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= R_1^{(1)}(1)\,\hat{P}_1^{(1)}(1) = r_1\hat{\mu}_1, \\ \frac{\partial R_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= R_1^{(1)}(1)\,\hat{P}_2^{(1)}(1) = r_1\hat{\mu}_2, \end{aligned}$$

Análogamente se tiene

$$R_2(\mathbf{z},\mathbf{w}) = R_2\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right) \tag{36.84.5}$$

$$\begin{aligned}
\frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= R_2^{(1)}(1)\,P_1^{(1)}(1) = r_2\mu_1,\\
\frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= R_2^{(1)}(1)\,\tilde{P}_2^{(1)}(1) = r_2\tilde{\mu}_2,\\
\frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= R_2^{(1)}(1)\,\hat{P}_1^{(1)}(1) = r_2\hat{\mu}_1,\\
\frac{\partial R_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= R_2^{(1)}(1)\,\hat{P}_2^{(1)}(1) = r_2\hat{\mu}_2,
\end{aligned}$$

Para el segundo sistema:

$$\hat{R}_1(\mathbf{z},\mathbf{w}) = \hat{R}_1\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right) \tag{36.84.6}$$

$$\begin{aligned}
\frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{R}_1^{(1)}(1)\,P_1^{(1)}(1) = \hat{r}_1\mu_1,\\
\frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{R}_1^{(1)}(1)\,\tilde{P}_2^{(1)}(1) = \hat{r}_1\tilde{\mu}_2,\\
\frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{R}_1^{(1)}(1)\,\hat{P}_1^{(1)}(1) = \hat{r}_1\hat{\mu}_1,\\
\frac{\partial \hat{R}_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{R}_1^{(1)}(1)\,\hat{P}_2^{(1)}(1) = \hat{r}_1\hat{\mu}_2,
\end{aligned}$$

Finalmente

$$\hat{R}_2(\mathbf{z},\mathbf{w}) = \hat{R}_2\left(P_1(z_1)\,\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right) \tag{36.84.7}$$

$$\begin{aligned}
\frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{R}_2^{(1)}(1)\,P_1^{(1)}(1) = \hat{r}_2\mu_1,\\
\frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{R}_2^{(1)}(1)\,\tilde{P}_2^{(1)}(1) = \hat{r}_2\tilde{\mu}_2,\\
\frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \hat{R}_2^{(1)}(1)\,\hat{P}_1^{(1)}(1) = \hat{r}_2\hat{\mu}_1,\\
\frac{\partial \hat{R}_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \hat{R}_2^{(1)}(1)\,\hat{P}_2^{(1)}(1) = \hat{r}_2\hat{\mu}_2.
\end{aligned}$$

36.84.2. Usuarios presentes en la cola

Hagamos lo correspondiente con las siguientes expresiones obtenidas en la sección anterior: Recordemos que

$$\begin{aligned}
F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right) &= F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z2\right)\\
&\quad \hat{F}_1(w_1, w_2; \tau_1)
\end{aligned}$$

entonces

$$\begin{aligned}
\frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= 0\\
\frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_1}{\partial z_1}\cdot\frac{\partial \theta_1}{\partial \tilde{P}_2}\cdot\frac{\partial \tilde{P}_2}{\partial z_2} + \frac{\partial F_1}{\partial z_2}\\
\frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_1}{\partial z_1}\cdot\frac{\partial \theta_1}{\partial \hat{P}_1}\cdot\frac{\partial \hat{P}_1}{\partial w_1} + \frac{\partial \hat{F}_1}{\partial w_1}\\
\frac{\partial F_1\left(\theta_1\left(\tilde{P}_2(z_2)\,\hat{P}_1(w_1)\,\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_1}{\partial z_1}\cdot\frac{\partial \theta_1}{\partial \hat{P}_2}\cdot\frac{\partial \hat{P}_2}{\partial w_2} + \frac{\partial \hat{F}_1}{\partial w_2}
\end{aligned}$$

para τ_2:

$$\begin{aligned} F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right) &= F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right)\right) \\ & \hat{F}_2\left(w_1,w_2;\tau_2\right) \end{aligned}$$

al igual que antes

$$\begin{aligned} \frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_2}{\partial z_2}\cdot\frac{\partial\tilde{\theta}_2}{\partial P_1}\cdot\frac{\partial P_1}{\partial z_2}+\frac{\partial F_2}{\partial z_1} \\ \frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= 0 \\ \frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_2}{\partial z_2}\cdot\frac{\partial\tilde{\theta}_2}{\partial\hat{P}_1}\cdot\frac{\partial\hat{P}_1}{\partial w_1}+\frac{\partial\hat{F}_2}{\partial w_1} \\ \frac{\partial F_2\left(z_1,\tilde{\theta}_2\left(P_1\left(z_1\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),w_1,w_2\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial F_2}{\partial z_2}\cdot\frac{\partial\tilde{\theta}_2}{\partial\hat{P}_2}\cdot\frac{\partial\hat{P}_2}{\partial w_2}+\frac{\partial\hat{F}_2}{\partial w_2} \end{aligned}$$

Ahora para el segundo sistema

$$\begin{aligned} \hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right) &= F_1\left(z_1,z_2;\zeta_1\right) \\ & \hat{F}_1\left(\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right) \end{aligned}$$

entonces

$$\begin{aligned} \frac{\partial\hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial\hat{F}_1}{\partial w_1}\cdot\frac{\partial\hat{\theta}_1}{\partial P_1}\cdot\frac{\partial P_1}{\partial z_1}+\frac{\partial F_1}{\partial z_1} \\ \frac{\partial\hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial\hat{F}_1}{\partial w_1}\cdot\frac{\partial\hat{\theta}_1}{\partial\tilde{P}_2}\cdot\frac{\partial\tilde{P}_2}{\partial z_2}+\frac{\partial F_1}{\partial z_2} \\ \frac{\partial\hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= 0 \\ \frac{\partial\hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_2\left(w_2\right)\right),w_2\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial\hat{F}_1}{\partial w_1}\cdot\frac{\partial\hat{\theta}_1}{\partial\hat{P}_2}\cdot\frac{\partial\hat{P}_2}{\partial w_2}+\frac{\partial\hat{F}_1}{\partial w_2} \end{aligned}$$

Finalmente para ζ_2

$$\begin{aligned} \hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right) &= F_2\left(z_1,z_2;\zeta_2\right) \\ & \hat{F}_2\left(w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right] \end{aligned}$$

por tanto:

$$\begin{aligned} \frac{\partial\hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial\hat{F}_2}{\partial w_2}\cdot\frac{\partial\hat{\theta}_2}{\partial P_1}\cdot\frac{\partial P_1}{\partial z_1}+\frac{\partial F_2}{\partial z_1} \\ \frac{\partial\hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial\hat{F}_2}{\partial w_2}\cdot\frac{\partial\hat{\theta}_2}{\partial\tilde{P}_2}\cdot\frac{\partial\tilde{P}_2}{\partial z_2}+\frac{\partial F_2}{\partial z_2} \\ \frac{\partial\hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial\hat{F}_2}{\partial w_2}\cdot\frac{\partial\hat{\theta}_2}{\partial\hat{P}_1}\cdot\frac{\partial\hat{P}_1}{\partial w_1}+\frac{\partial\hat{F}_2}{\partial w_1} \\ \frac{\partial\hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1\left(z_1\right)\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\right)\right)}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= 0 \end{aligned}$$

36.84.3. Ecuaciones Recursivas

Entonces, de todo lo desarrollado hasta ahora se tienen las siguientes ecuaciones:

$$
\begin{aligned}
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial R_1}{\partial z_1}+\frac{\partial F_1}{\partial z_1}=r_1\mu_1\\
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial R_1}{\partial z_2}+\frac{\partial F_1}{\partial z_2}=r_1\tilde{\mu}_2+f_1(1)\left(\frac{1}{1-\mu_1}\right)\tilde{\mu}_2+f_1(2)\\
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial R_1}{\partial w_1}+\frac{\partial F_1}{\partial w_1}=r_1\hat{\mu}_1+f_1(1)\left(\frac{1}{1-\mu_1}\right)\hat{\mu}_1+\hat{F}_{1,1}^{(1)}(1)\\
\frac{\partial F_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial R_1}{\partial w_2}+\frac{\partial F_1}{\partial w_2}=r_1\hat{\mu}_2+f_1(1)\left(\frac{1}{1-\mu_1}\right)\hat{\mu}_2+\hat{F}_{2,1}^{(1)}(1)
\end{aligned}
$$

$$
\begin{aligned}
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial R_2}{\partial z_1}+\frac{\partial F_2}{\partial z_1}=r_2\mu_1+f_2(2)\left(\frac{1}{1-\tilde{\mu}_2}\right)\mu_1+f_2(1)\\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial R_2}{\partial z_2}+\frac{\partial F_2}{\partial z_2}=r_2\tilde{\mu}_2\\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial R_2}{\partial w_1}+\frac{\partial F_2}{\partial w_1}=r_2\hat{\mu}_1+f_2(2)\left(\frac{1}{1-\tilde{\mu}_2}\right)\hat{\mu}_1+\hat{F}_{2,1}^{(1)}(1)\\
\frac{\partial F_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial R_2}{\partial w_2}+\frac{\partial F_2}{\partial w_2}=r_2\hat{\mu}_2+f_2(2)\left(\frac{1}{1-\tilde{\mu}_2}\right)\hat{\mu}_2+\hat{F}_{2,2}^{(1)}(1)
\end{aligned}
$$

$$
\begin{aligned}
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{R}_1}{\partial z_1}+\frac{\partial \hat{F}_1}{\partial z_1}=\hat{r}_1\mu_1+\hat{f}_1(1)\left(\frac{1}{1-\hat{\mu}_1}\right)\mu_1+F_{1,1}^{(1)}(1)\\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{R}_1}{\partial z_2}+\frac{\partial \hat{F}_1}{\partial z_2}=\hat{r}_1\mu_2+\hat{f}_1(1)\left(\frac{1}{1-\hat{\mu}_1}\right)\tilde{\mu}_2+F_{2,1}^{(1)}(1)\\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{R}_1}{\partial w_1}+\frac{\partial \hat{F}_1}{\partial w_1}=\hat{r}_1\hat{\mu}_1\\
\frac{\partial \hat{F}_2(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{R}_1}{\partial w_2}+\frac{\partial \hat{F}_1}{\partial w_2}=\hat{r}_1\hat{\mu}_2+\hat{f}_1(1)\left(\frac{1}{1-\hat{\mu}_1}\right)\hat{\mu}_2+\hat{f}_1(2)
\end{aligned}
$$

$$
\begin{aligned}
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial z_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{R}_2}{\partial z_1}+\frac{\partial \hat{F}_2}{\partial z_1}=\hat{r}_2\mu_1+\hat{f}_2(1)\left(\frac{1}{1-\hat{\mu}_2}\right)\mu_1+F_{1,2}^{(1)}(1)\\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial z_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{R}_2}{\partial z_2}+\frac{\partial \hat{F}_2}{\partial z_2}=\hat{r}_2\tilde{\mu}_2+\hat{f}_2(2)\left(\frac{1}{1-\hat{\mu}_2}\right)\tilde{\mu}_2+F_{2,2}^{(1)}(1)\\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial w_1}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{R}_2}{\partial w_1}+\frac{\partial \hat{F}_2}{\partial w_1}=\hat{r}_2\hat{\mu}_1+\hat{f}_2(2)\left(\frac{1}{1-\hat{\mu}_2}\right)\hat{\mu}_1+\hat{f}_2(1)\\
\frac{\partial \hat{F}_1(\mathbf{z},\mathbf{w})}{\partial w_2}|_{\mathbf{z},\mathbf{w}=1} &= \frac{\partial \hat{R}_2}{\partial w_2}+\frac{\partial \hat{F}_2}{\partial w_2}=\hat{r}_2\hat{\mu}_2
\end{aligned}
$$

Es decir, se tienen las siguientes ecuaciones:

$$
\begin{aligned}
f_2(1) &= r_1\mu_1\\
f_1(2) &= r_2\tilde{\mu}_2\\
f_2(2) &= r_1\tilde{\mu}_2+\tilde{\mu}_2\left(\frac{f_1(1)}{1-\mu_1}\right)+f_1(2)=\left(r_1+\frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2+r_2\tilde{\mu}_2\\
&= \left(r_1+r_2+\frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2=\left(r+\frac{f_1(1)}{1-\mu_1}\right)\tilde{\mu}_2\\
f_2(3) &= r_1\hat{\mu}_1+\hat{\mu}_1\left(\frac{f_1(1)}{1-\mu_1}\right)+\hat{F}_{1,1}^{(1)}(1)=\hat{\mu}_1\left(r_1+\frac{f_1(1)}{1-\mu_1}\right)+\frac{\hat{\mu}_1}{\mu_1}\\
f_2(4) &= r_1\hat{\mu}_2+\hat{\mu}_2\left(\frac{f_1(1)}{1-\mu_1}\right)+\hat{F}_{2,1}^{(1)}(1)=\hat{\mu}_2\left(r_1+\frac{f_1(1)}{1-\mu_1}\right)+\frac{\hat{\mu}_2}{\mu_1}
\end{aligned}
$$

$$
\begin{aligned}
f_1(1) &= r_2\mu_1 + \mu_1\left(\frac{f_2(2)}{1-\tilde{\mu}_2}\right) + r_1\mu_1 = \mu_1\left(r_1 + r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) \\
&= \mu_1\left(r + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) \\
f_1(3) &= r_2\hat{\mu}_1 + \hat{\mu}_1\left(\frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \hat{F}_{1,2}^{(1)}(1) = \hat{\mu}_1\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_1}{\mu_2} \\
f_1(4) &= r_2\hat{\mu}_2 + \hat{\mu}_2\left(\frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \hat{F}_{2,2}^{(1)}(1) = \hat{\mu}_2\left(r_2 + \frac{f_2(2)}{1-\tilde{\mu}_2}\right) + \frac{\hat{\mu}_2}{\mu_2} \\
\hat{f}_1(4) &= \hat{r}_2\hat{\mu}_2 \\
\hat{f}_2(3) &= \hat{r}_1\hat{\mu}_1 \\
\hat{f}_1(1) &= \hat{r}_2\mu_1 + \mu_1\left(\frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right) + F_{1,2}^{(1)}(1) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\mu_1 + \frac{\mu_1}{\hat{\mu}_2}
\end{aligned}
$$

$$
\begin{aligned}
\hat{f}_1(2) &= \hat{r}_2\tilde{\mu}_2 + \tilde{\mu}_2\left(\frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right) + F_{2,2}^{(1)}(1) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\tilde{\mu}_2 + \frac{\mu_2}{\hat{\mu}_2} \\
\hat{f}_1(3) &= \hat{r}_2\hat{\mu}_1 + \hat{\mu}_1\left(\frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right) + \hat{f}_2(3) = \left(\hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 + \hat{r}_1\hat{\mu}_1 \\
&= \left(\hat{r}_1 + \hat{r}_2 + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 = \left(\hat{r} + \frac{\hat{f}_2(4)}{1-\hat{\mu}_2}\right)\hat{\mu}_1 \\
\hat{f}_2(1) &= \hat{r}_1\mu_1 + \mu_1\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + F_{1,1}^{(1)}(1) = \left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\mu_1 + \frac{\mu_1}{\hat{\mu}_1} \\
\hat{f}_2(2) &= \hat{r}_1\tilde{\mu}_2 + \tilde{\mu}_2\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + F_{2,1}^{(1)}(1) = \left(\hat{r}_1 + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\tilde{\mu}_2 + \frac{\mu_2}{\hat{\mu}_1} \\
\hat{f}_2(4) &= \hat{r}_1\hat{\mu}_2 + \hat{\mu}_2\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) + \hat{f}_1(4) = \hat{r}_1\hat{\mu}_2 + \hat{r}_2\hat{\mu}_2 + \hat{\mu}_2\left(\frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right) \\
&= \left(\hat{r} + \frac{\hat{f}_1(3)}{1-\hat{\mu}_1}\right)\hat{\mu}_2
\end{aligned}
$$

36.84.4. Solución del Sistema de Ecuaciones Lineales

A saber, se puede demostrar que la solución del sistema de ecuaciones está dado por las siguientes expresiones, donde

$$\mu = \mu_1 + \tilde{\mu}_2 \ , \ \hat{\mu} = \hat{\mu}_1 + \hat{\mu}_2 \ , \ r = r_1 + r_2 \text{ y } \hat{r} = \hat{r}_1 + \hat{r}_2$$

entonces

$$
\begin{aligned}
f_1(1) &= r\frac{\mu_1(1-\mu_1)}{1-\mu} \\
f_2(2) &= r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu}
\end{aligned}
$$

$$
\begin{aligned}
f_1(3) &= \hat{\mu}_1\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right) \\
f_1(4) &= \hat{\mu}_2\left(\frac{r_2\mu_2+1}{\mu_2} + r\frac{\tilde{\mu}_2}{1-\mu}\right)
\end{aligned}
$$

$$
\begin{aligned}
f_2(3) &= \hat{\mu}_1\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right) \\
f_2(4) &= \hat{\mu}_2\left(\frac{r_1\mu_1+1}{\mu_1} + r\frac{\mu_1}{1-\mu}\right)
\end{aligned}
$$

$$\begin{aligned}
\hat{f}_2(4) &= \hat{r}\frac{\hat{\mu}_2(1-\hat{\mu}_2)}{1-\hat{\mu}} \\
\hat{f}_1(3) &= \hat{r}\frac{\hat{\mu}_1(1-\hat{\mu}_1)}{1-\hat{\mu}}
\end{aligned}$$

$$\begin{aligned}
\hat{f}_1(1) &= \mu_1\left(\frac{\hat{r}_2\hat{\mu}_2+1}{\hat{\mu}_2}+\hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right) \\
\hat{f}_1(2) &= \tilde{\mu}_2\left(\hat{r}_2+\hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right)+\frac{\mu_2}{\hat{\mu}_2} \\
\hat{f}_2(1) &= \mu_1\left(\frac{\hat{r}_1\hat{\mu}_1+1}{\hat{\mu}_1}+\hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right) \\
\hat{f}_2(2) &= \tilde{\mu}_2\left(\hat{r}_1+\hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right)+\frac{\hat{\mu_2}}{\hat{\mu}_1}
\end{aligned}$$

A saber

$$\begin{aligned}
f_1(3) &= \hat{\mu}_1\left(r_2+\frac{f_2(2)}{1-\tilde{\mu}_2}\right)+\frac{\hat{\mu}_1}{\mu_2}=\hat{\mu}_1\left(r_2+\frac{r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu}}{1-\tilde{\mu}_2}\right)+\frac{\hat{\mu}_1}{\mu_2} \\
&= \hat{\mu}_1\left(r_2+\frac{r\tilde{\mu}_2}{1-\mu}\right)+\frac{\hat{\mu}_1}{\mu_2}=\hat{\mu}_1\left(r_2+\frac{r\tilde{\mu}_2}{1-\mu}+\frac{1}{\mu_2}\right) \\
&= \hat{\mu}_1\left(\frac{r_2\mu_2+1}{\mu_2}+\frac{r\tilde{\mu}_2}{1-\mu}\right)
\end{aligned}$$

$$\begin{aligned}

&= \tilde{\mu}_2\left(\hat{r}_1+\frac{\hat{r}\hat{\mu}_1}{1-\hat{\mu}}\right)+\frac{\mu_2}{\hat{\mu}_1}
\end{aligned}$$

36.85. Segundos Momentos

Para poder determinar los segundos momentos para los tiempos de traslado del servidor es necesario enunciar y demostrar la siguiente proposición:

Proposición 36.85.1 *Sea $f(g(x)h(y))$ función continua tal que tiene derivadas parciales mixtas de segundo orden, entonces se tiene lo siguiente:*

$$\frac{\partial}{\partial x}f(g(x)h(y))=\frac{\partial f(g(x)h(y))}{\partial x}\cdot\frac{\partial g(x)}{\partial x}\cdot h(y)$$

por tanto

$$\frac{\partial}{\partial x}\frac{\partial}{\partial x}f(g(x)h(y)) = \frac{\partial^2}{\partial x}f(g(x)h(y))\cdot\left(\frac{\partial g(x)}{\partial x}\right)^2\cdot h^2(y)+\frac{\partial}{\partial x}f(g(x)h(y))\cdot\frac{\partial g^2(x)}{\partial x^2}\cdot h(y) \quad (36.85.1)$$

y

$$\frac{\partial}{\partial y}\frac{\partial}{\partial x}f(g(x)h(y)) = \frac{\partial g(x)}{\partial x}\cdot\frac{\partial h(y)}{\partial y}\left\{\frac{\partial^2}{\partial y\partial x}f(g(x)h(y))\cdot g(x)\cdot h(y)+\frac{\partial}{\partial x}f(g(x)h(y))\right\}$$

Demostración 36.85.1

$$\begin{aligned}
\frac{\partial}{\partial x}\frac{\partial}{\partial x}f(g(x)h(y)) &= \frac{\partial}{\partial x}\left\{\frac{\partial f(g(x)h(y))}{\partial x}\cdot\frac{\partial g(x)}{\partial x}\cdot h(y)\right\}\\
&= \frac{\partial}{\partial x}\left\{\frac{\partial}{\partial x}f(g(x)h(y))\right\}\cdot\frac{\partial g(x)}{\partial x}\cdot h(y)+\frac{\partial}{\partial x}f(g(x)h(y))\cdot\frac{\partial g^2(x)}{\partial x^2}\cdot h(y)\\
&= \frac{\partial^2}{\partial x}f(g(x)h(y))\cdot\frac{\partial g(x)}{\partial x}\cdot h(y)\cdot\frac{\partial g(x)}{\partial x}\cdot h(y)+\frac{\partial}{\partial x}f(g(x)h(y))\cdot\frac{\partial g^2(x)}{\partial x^2}\cdot h(y)\\
&= \frac{\partial^2}{\partial x}f(g(x)h(y))\cdot\left(\frac{\partial g(x)}{\partial x}\right)^2\cdot h^2(y)+\frac{\partial}{\partial x}f(g(x)h(y))\cdot\frac{\partial g^2(x)}{\partial x^2}\cdot h(y).
\end{aligned}$$

Por otra parte:

$$\begin{aligned}
\frac{\partial}{\partial y}\frac{\partial}{\partial x}f(g(x)h(y)) &= \frac{\partial}{\partial y}\left\{\frac{\partial f(g(x)h(y))}{\partial x}\cdot\frac{\partial g(x)}{\partial x}\cdot h(y)\right\}\\
&= \frac{\partial}{\partial y}\left\{\frac{\partial}{\partial x}f(g(x)h(y))\right\}\cdot\frac{\partial g(x)}{\partial x}\cdot h(y)+\frac{\partial}{\partial x}f(g(x)h(y))\cdot\frac{\partial g(x)}{\partial x}\cdot\frac{\partial h(y)}{y}\\
&= \frac{\partial^2}{\partial y\partial x}f(g(x)h(y))\cdot\frac{\partial h(y)}{\partial y}\cdot g(x)\cdot\frac{\partial g(x)}{\partial x}\cdot h(y)+\frac{\partial}{\partial x}f(g(x)h(y))\cdot\frac{\partial g(x)}{\partial x}\cdot\frac{\partial h(y)}{\partial y}\\
&= \frac{\partial g(x)}{\partial x}\cdot\frac{\partial h(y)}{\partial y}\left\{\frac{\partial^2}{\partial y\partial x}f(g(x)h(y))\cdot g(x)\cdot h(y)+\frac{\partial}{\partial x}f(g(x)h(y))\right\}
\end{aligned}$$

Para la siguiente proposición es necesario utilizar el resultado (36.85.1)

Proposición 36.85.2 *Sea R_i la Función Generadora de Probabilidades para el número de arribos a cada una de las colas de la Red de Sistemas de Visitas Cíclicas definidas como en (36.84.4). Entonces las derivadas parciales están dadas por las siguientes expresiones:*

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_i^2} &= \left(\frac{\partial P_i(z_i)}{\partial z_i}\right)^2 \cdot \frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial^2 z_i} \\ &+ \left(\frac{\partial P_i(z_i)}{\partial z_i}\right)^2 \cdot \frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_i}\end{aligned}$$

y además

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_2\partial z_1} &= \frac{\partial\tilde{P}_2(z_2)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_2\partial z_1} \\ &+ \frac{\partial\tilde{P}_2(z_2)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_1},\end{aligned}$$

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_1} &= \frac{\partial\hat{P}_i(w_i)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_1} \\ &+ \frac{\partial\hat{P}_i(w_i)}{\partial z_2}\cdot\frac{\partial P_1(z_1)}{\partial z_1}\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_1},\end{aligned}$$

finalmente

$$\begin{aligned}\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_2} &= \frac{\partial\hat{P}_i(w_i)}{\partial w_i}\cdot\frac{\partial\tilde{P}_2(z_2)}{\partial z_2}\cdot\frac{\partial^2 R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial w_i\partial z_2} \\ &+ \frac{\partial\hat{P}_i(w_i)}{\partial w_i}\cdot\frac{\partial\tilde{P}_2(z_2)}{\partial z_1}\cdot\frac{\partial R_i\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)}{\partial z_2},\end{aligned}$$

para $i = 1, 2$.

36.86. Sistema de Ecuaciones Lineales para los Segundos Momentos

En el apéndice A se demuestra que las ecuaciones para las ecuaciones parciales mixtas están dadas por:

1.
$$\begin{aligned}f_1(1,1) &= r_2 P_1^{(2)}(1) + \mu_1^2 R_2^{(2)}(1) + 2\mu_1 r_2\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2) + f_2(1)\right) + \frac{1}{1-\tilde{\mu}_2}P_1^{(2)}f_2(2) \\ &+ \mu_1^2\tilde{\theta}_2^{(2)}(1)f_2(2) + \frac{\mu_1}{1-\tilde{\mu}_2}f_2(1,2) + \frac{\mu_1}{1-\tilde{\mu}_2}\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2,2) + f_2(1,2)\right) + f_2(1,1).\end{aligned}$$

2.
$$f_1(2,1) = \mu_1 r_2\tilde{\mu}_2 + \mu_1\tilde{\mu}_2 R_2^{(2)}(1) + r_2\tilde{\mu}_2\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2) + f_2(1)\right).$$

3.
$$\begin{aligned}f_1(3,1) &= \mu_1\hat{\mu}_1 r_2 + \mu_1\hat{\mu}_1 R_2^{(2)}(1) + r_2\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2) + r_2\hat{\mu}_1\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2) + f_2(1)\right) + \mu_1 r_2\hat{F}_{2,1}^{(1)}(1) \\ &+ \left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2) + f_2(1)\right)\hat{F}_{2,1}^{(1)}(1) + \frac{\mu_1\hat{\mu}_1}{1-\tilde{\mu}_2}f_2(2) + \mu_1\hat{\mu}_1\tilde{\theta}_2^{(2)}(1)f_2(2) \\ &+ \mu_1\hat{\mu}_1\left(\frac{1}{1-\tilde{\mu}_2}\right)^2 f_2(2,2) + \frac{\hat{\mu}_1}{1-\tilde{\mu}_2}f_2(1,2).\end{aligned}$$

4.

$$\begin{aligned} f_1(4,1) &= \mu_1\hat{\mu}_2 r_2 + \mu_1\hat{\mu}_2 R_2^{(2)}(1) + r_2\frac{\mu_1\hat{\mu}_2}{1-\tilde{\mu}_2}f_2(2) + \mu_1 r_2\hat{F}_{2,2}^{(1)}(1) + r_2\hat{\mu}_2\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right) \\ &+ \hat{F}_{2,1}^{(1)}(1)\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right) + \frac{\mu_1\hat{\mu}_2}{1-\tilde{\mu}_2}f_2(2) + \mu_1\hat{\mu}_2\tilde{\theta}_2^{(2)}(1)f_2(2) \\ &+ \mu_1\hat{\mu}_2\left(\frac{1}{1-\tilde{\mu}_2}\right)^2 f_2(2,2) + \frac{\hat{\mu}_2}{1-\tilde{\mu}_2}f_2^{(1,2)}. \end{aligned}$$

5.

$$f_1(1,2) = \mu_1\tilde{\mu}_2 r_2 + \mu_1\tilde{\mu}_2 R_2^{(2)}(1) + r_2\tilde{\mu}_2\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right).$$

6.

$$f_1(2,2) = \tilde{\mu}_2^2 R_2^{(2)}(1) + r_2\tilde{P}_2^{(2)}(1).$$

7.

$$f_1(3,2) = \hat{\mu}_1\tilde{\mu}_2 r_2 + \hat{\mu}_1\tilde{\mu}_2 R_2^{(2)}(1) + r_2\frac{\hat{\mu}_1\tilde{\mu}_2}{1-\tilde{\mu}_2}f_2(2) + r_2\tilde{\mu}_2\hat{F}_{2,2}^{(1)}(1).$$

8.

$$f_1(4,2) = \hat{\mu}_2\tilde{\mu}_2 r_2 + \hat{\mu}_2\tilde{\mu}_2 R_2^{(2)}(1) + r_2\frac{\hat{\mu}_2\tilde{\mu}_2}{1-\tilde{\mu}_2}f_2(2) + r_2\tilde{\mu}_2\hat{F}_{2,2}^{(1)}(1).$$

9.

$$\begin{aligned} f_1(1,3) &= \mu_1\hat{\mu}_1 r_2 + \mu_1\hat{\mu}_1 R_2^{(2)}(1) + \frac{\mu_1\hat{\mu}_1}{1-\tilde{\mu}_2}f_2(2) + r_2\frac{\mu_1\hat{\mu}_1}{1-\tilde{\mu}_2}f_2(2) + \mu_1\hat{\mu}_1\tilde{\theta}_2^{(2)}(1)f_2(2) \\ &+ r_2\hat{\mu}_1\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2)+f_2(1)\right) + r_2\mu_1\hat{F}_{2,1}^{(1)}(1) + \left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(1)+f_2(1)\right)\hat{F}_{2,1}^{(1)}(1) \\ &+ \frac{\hat{\mu}_1}{1-\tilde{\mu}_2}\left(\frac{\mu_1}{1-\tilde{\mu}_2}f_2(2,2)+f_2^{(1,2)}\right). \end{aligned}$$

10.

$$f_1(2,3) = \tilde{\mu}_2\hat{\mu}_1 r_2 + \tilde{\mu}_2\hat{\mu}_1 R_2^{(2)}(1) + r_2\frac{\tilde{\mu}_2\hat{\mu}_1}{1-\tilde{\mu}_2}f_2(2) + r_2\tilde{\mu}_2\hat{F}_{2,1}^{(1)}(1).$$

11.

$$\begin{aligned} f_1(3,3) &= \hat{\mu}_1^2 R_2^{(2)}(1) + r_2\hat{P}_1^{(2)}(1) + 2r_2\frac{\hat{\mu}_1^2}{1-\tilde{\mu}_2}f_2(2) + \hat{\mu}_1^2\tilde{\theta}_2^{(2)}(1)f_2(2) + \frac{1}{1-\tilde{\mu}_2}\hat{P}_1^{(2)}(1)f_2(2) \\ &+ \frac{\hat{\mu}_1^2}{1-\tilde{\mu}_2}f_2(2,2) + 2r_2\hat{\mu}_1\hat{F}_{2,1}^{(1)}(1) + 2\frac{\hat{\mu}_1}{1-\tilde{\mu}_2}f_2(2)\hat{F}_{2,1}^{(1)}(1) + \hat{f}_{2,1}^{(2)}(1). \end{aligned}$$

12.

&+ \frac{\hat{\mu}_2}{1-\hat{\mu}_1}\left(\hat{f}_1(1,2) + \frac{\hat{\mu}_2}{1-\hat{\mu}_1}\hat{f}_1(1,1)\right).
\end{aligned}$$

36.87. Tiempos de Ciclo e Intervisita

Definición 36.87.1 *Sea L_i^* el número de usuarios en la cola Q_i cuando es visitada por el servidor para dar servicio, entonces*

$$\mathbb{E}[L_i^*] = f_i(i) \tag{36.87.1}$$

$$Var[L_i^*] = f_i(i,i) + \mathbb{E}[L_i^*] - \mathbb{E}[L_i^*]^2. \tag{36.87.2}$$

Definición 36.87.2 *El tiempo de Ciclo C_i es e periodo de tiempo que comienza cuando la cola i es visitada por primera vez en un ciclo, y termina cuando es visitado nuevamente en el próximo ciclo. La duración del mismo está dada por $\tau_i(m+1) - \tau_i(m)$, o equivalentemente $\overline{\tau}_i(m+1) - \overline{\tau}_i(m)$ bajo condiciones de estabilidad.*

Definición 36.87.3 *El tiempo de intervisita I_i es el periodo de tiempo que comienza cuando se ha completado el servicio en un ciclo y termina cuando es visitada nuevamente en el próximo ciclo. Su duración del mismo está dada por $\tau_i(m+1) - \overline{\tau}_i(m)$.*

Recordemos las siguientes expresiones:

$$\begin{aligned}
S_i(z) &= \mathbb{E}\left[z^{\overline{\tau}_i(m)-\tau_i(m)}\right] = F_i(\theta(z)), \\
F(z) &= \mathbb{E}\left[z^{L_0}\right], \\
P(z) &= \mathbb{E}\left[z^{X_n}\right], \\
F_i(z) &= \mathbb{E}\left[z^{L_i(\tau_i(m))}\right], \theta_i(z) - zP_i
\end{aligned}$$

entonces

$$\begin{aligned}
\mathbb{E}[S_i] &= \frac{\mathbb{E}[L_i^*]}{1-\mu_i} = \frac{f_i(i)}{1-\mu_i}, \\
Var[S_i] &= \frac{Var[L_i^*]}{(1-\mu_i)^2} + \frac{\sigma^2\mathbb{E}[L_i^*]}{(1-\mu_i)^3}
\end{aligned}$$

donde recordemos que

$$Var[L_i^*] = f_i(i,i) + f_i(i) - f_i(i)^2.$$

La duración del tiempo de intervisita es $\tau_i(m+1) - \overline{\tau}(m)$. Dado que el número de usuarios presentes en Q_i al tiempo $t = \tau_i(m+1)$ es igual al número de arribos durante el intervalo de tiempo $[\overline{\tau}(m), \tau_i(m+1)]$ se tiene que

$$\mathbb{E}\left[z_i^{L_i(\tau_i(m+1))}\right] = \mathbb{E}\left[\{P_i(z_i)\}^{\tau_i(m+1)-\overline{\tau}(m)}\right]$$

entonces, si

$$I_i(z) = \mathbb{E}\left[z^{\tau_i(m+1)-\overline{\tau}(m)}\right]$$

se tienen que

$$F_i(z) = I_i[P_i(z)]$$

para $i = 1, 2$, por tanto

$$\begin{aligned} \mathbb{E}[L_i^*] &= \mu_i \mathbb{E}[I_i] \\ Var[L_i^*] &= \mu_i^2 Var[I_i] + \sigma^2 \mathbb{E}[I_i] \end{aligned}$$

para $i = 1, 2$, por tanto

$$\mathbb{E}[I_i] = \frac{f_i(i)}{\mu_i},$$

además

$$Var[I_i] = \frac{Var[L_i^*]}{\mu_i^2} - \frac{\sigma_i^2}{\mu_i^2} f_i(i).$$

Si $C_i(z) = \mathbb{E}\left[z^{\overline{\tau}(m+1)-\overline{\tau}_i(m)}\right]$el tiempo de duración del ciclo, entonces, por lo hasta ahora establecido, se tiene que

$$C_i(z) = I_i[\theta_i(z)],$$

entonces

$$\begin{aligned} \mathbb{E}[C_i] &= \mathbb{E}[I_i]\mathbb{E}[\theta_i(z)] = \frac{\mathbb{E}[L_i^*]}{\mu_i}\frac{1}{1-\mu_i} = \frac{f_i(i)}{\mu_i(1-\mu_i)} \\ Var[C_i] &= \frac{Var[L_i^*]}{\mu_i^2(1-\mu_i)^2}. \end{aligned}$$

Por tanto se tienen las siguientes igualdades

$$\begin{aligned} \mathbb{E}[S_i] &= \mu_i \mathbb{E}[C_i], \\ \mathbb{E}[I_i] &= (1-\mu_i)\mathbb{E}[C_i] \end{aligned}$$

Defínanse los puntos de regenaración en el proceso $[L_1(t), L_2(t), \ldots, L_N(t)]$. Los puntos cuando la cola i es visitada y todos los $L_j(\tau_i(m)) = 0$ para $i = 1, 2$ son puntos de regeneración. Se llama ciclo regenerativo al intervalo entre dos puntos regenerativos sucesivos.

Sea M_i el número de ciclos de visita en un ciclo regenerativo, y sea $C_i^{(m)}$, para $m = 1, 2, \ldots, M_i$ la duración del m-ésimo ciclo de visita en un ciclo regenerativo. Se define el ciclo del tiempo de visita promedio $\mathbb{E}[C_i]$ como

$$\mathbb{E}[C_i] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right]}{\mathbb{E}[M_i]}$$

En Stid72 y Heym82 se muestra que una condición suficiente para que el proceso regenerativo estacionario sea un procesoo estacionario es que el valor esperado del tiempo del ciclo regenerativo sea finito:

$$\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right] < \infty.$$

como cada $C_i^{(m)}$ contiene intervalos de réplica positivos, se tiene que $\mathbb{E}[M_i] < \infty$, además, como $M_i > 0$, se tiene que la condición anterior es equivalente a tener que

$$\mathbb{E}\left[C_i\right] < \infty,$$

por lo tanto una condición suficiente para la existencia del proceso regenerativo está dada por

$$\sum_{k=1}^{N} \mu_k < 1.$$

Sea la función generadora de momentos para L_i, el número de usuarios en la cola $Q_i(z)$ en cualquier momento, está dada por el tiempo promedio de $z^{L_i(t)}$ sobre el ciclo regenerativo definido anteriormente:

$$Q_i(z) = \mathbb{E}\left[z^{L_i(t)}\right] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i}\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}\left[\sum_{m=1}^{M_i}\tau_i(m+1)-\tau_i(m)\right]}$$

M_i es un tiempo de paro en el proceso regenerativo con $\mathbb{E}\left[M_i\right] < \infty$, se sigue del lema de Wald que:

$$\begin{aligned}
\mathbb{E}\left[\sum_{m=1}^{M_i}\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}\left[M_i\right]\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] \\
\mathbb{E}\left[\sum_{m=1}^{M_i}\tau_i(m+1)-\tau_i(m)\right] &= \mathbb{E}\left[M_i\right]\mathbb{E}\left[\tau_i(m+1)-\tau_i(m)\right]
\end{aligned}$$

por tanto se tiene que

$$Q_i(z) = \frac{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}\left[\tau_i(m+1)-\tau_i(m)\right]}$$

observar que el denominador es simplemente la duración promedio del tiempo del ciclo.

Se puede demostrar (ver Hideaki Takagi 1986) que

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = z\frac{F_i(z)-1}{z-P_i(z)}$$

Durante el tiempo de intervisita para la cola i, $L_i(t)$ solamente se incrementa de manera que el incremento por intervalo de tiempo está dado por la función generadora de probabilidades de $P_i(z)$, por tanto la suma sobre el tiempo de intervisita puede evaluarse como:

$$\begin{aligned}
\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} \left\{P_i(z)\right\}^{t-\overline{\tau}_i(m)}\right] = \frac{1-\mathbb{E}\left[\left\{P_i(z)\right\}^{\tau_i(m+1)-\overline{\tau}_i(m)}\right]}{1-P_i(z)} \\
&= \frac{1-I_i\left[P_i(z)\right]}{1-P_i(z)}
\end{aligned}$$

por tanto

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = \frac{1-F_i(z)}{1-P_i(z)}$$

Haciendo uso de lo hasta ahora desarrollado se tiene que

$$\begin{aligned}
Q_i(z) &= \frac{1}{\mathbb{E}\left[C_i\right]}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)} \\
&= \frac{\mu_i(1-\mu_i)}{f_i(i)}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)}
\end{aligned}$$

derivando con respecto a z

$$\begin{aligned}
\frac{dQ_i(z)}{dz} &= \frac{(1-F_i(z))P_i(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\
&- \frac{(1-z)P_i(z)F_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\
&- \frac{(1-z)(1-F_i(z))P_i(z)\left(P_i^{'}(z)-1\right)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)^2} \\
&+ \frac{(1-z)(1-F_i(z))P_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\
&+ \frac{(1-z)(1-F_i(z))P_i(z)P_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))^2(P_i(z)-z)}
\end{aligned}$$

Calculando el límite cuando $z \to 1^+$:

$$Q_i^{(1)}(z) = \lim_{z\to 1^+}\frac{dQ_i(z)}{dz} = \lim_{z\to 1}\frac{(1-F_i(z))P_i(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \tag{36.87.3}$$

$$- \lim_{z\to 1^+}\frac{(1-z)P_i(z)F_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \tag{36.87.4}$$

$$- \lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i(z)\left(P_i^{'}(z)-1\right)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)^2} \tag{36.87.5}$$

$$+ \lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \tag{36.87.6}$$

$$+ \lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i(z)P_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))^2(P_i(z)-z)} \tag{36.87.7}$$

Entonces:

$$\begin{aligned}
\lim_{z\to 1^+}\frac{(1-F_i(z))P_i(z)}{(1-P_i(z))(P_i(z)-z)} &= \lim_{z\to 1^+}\frac{\frac{d}{dz}\left[(1-F_i(z))P_i(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))(-z+P_i(z))\right]} \\
&= \lim_{z\to 1^+}\frac{-P_i(z)F_i^{'}(z)+(1-F_i(z))P_i^{'}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))P_i^{'}(z)}
\end{aligned}$$

$$\begin{aligned}
\lim_{z\to 1^+}\frac{(1-z)P_i(z)F_i^{'}(z)}{(1-P_i(z))(P_i(z)-z)} &= \lim_{z\to 1^+}\frac{\frac{d}{dz}\left[(1-z)P_i(z)F_i^{'}(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))(P_i(z)-z)\right]} \\
&= \lim_{z\to 1^+}\frac{-P_i(z)F_i^{'}(z)+(1-z)F_i^{'}(z)P_i^{'}(z)+(1-z)P_i(z)F_i^{''}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))P_i^{'}(z)}
\end{aligned}$$

$$\lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i(z)\left(P_i^{'}(z)-1\right)}{(1-P_i(z))(P_i(z)-z)^2} = \lim_{z\to 1^+}\frac{\frac{d}{dz}\left[(1-z)(1-F_i(z))P_i(z)\left(P_i^{'}(z)-1\right)\right]}{\frac{d}{dz}\left[(1-P_i(z))(P_i(z)-z)^2\right]}$$

$$\begin{aligned}
= &\lim_{z\to 1^+}\frac{-(1-F_i(z))P_i(z)\left(-1+P_i^{'}(z)\right)-(1-z)P_i(z)F_i^{'}(z)\left(-1+P_i^{'}(z)\right)}{2(1-P_i(z))(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2P_i^{'}(z)} \\
+ &\lim_{z\to 1^+}\frac{+(1-z)(1-F_i(z))\left(-1+P_i^{'}(z)\right)P_i^{'}(z)}{2(1-P_i(z))(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2P_i^{'}(z)} \\
+ &\lim_{z\to 1^+}\frac{+(1-z)(1-F_i(z))P_i(z)P_i^{''}(z)}{2(1-P_i(z))(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2P_i^{'}(z)}
\end{aligned}$$

$$\lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i^{'}(z)}{(1-P_i(z))(P_i(z)-z)} = \lim_{z\to 1^+}\frac{\frac{d}{dz}\left[(1-z)(1-F_i(z))P_i^{'}(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))(P_i(z)-z)\right]}$$

$$= \lim_{z\to 1^+}\frac{-(1-F_i(z))P_i^{'}(z)-(1-z)F_i^{'}(z)P_i^{'}(z)+(1-z)(1-F_i(z))P_i^{''}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))P_i^{'}(z)}$$

$$\begin{aligned}
\lim_{z\to 1^+} \frac{(1-z)(1-F_i(z))P_i(z)P_i'(z)}{(1-P_i(z))^2(P_i(z)-z)} &= \lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)(1-F_i(z))P_i(z)P_i'(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))^2(P_i(z)-z)\right]} \\
= \lim_{z\to 1^+} \frac{-(1-F_i(z))P_i(z)P_i'(z)-(1-z)P_i(z)F_i'(z)P_i'[z]}{(1-P_i(z))^2\left(-1+P_i'(z)\right)-2(1-P_i(z))(-z+P_i(z))P_i'(z)} \\
+ \lim_{z\to 1^+} \frac{(1-z)(1-F_i(z))P_i'(z)^2+(1-z)(1-F_i(z))P_i(z)P_i''(z)}{(1-P_i(z))^2\left(-1+P_i'(z)\right)-2(1-P_i(z))(-z+P_i(z))P_i'(z)}
\end{aligned}$$

36.87.1. Longitudes de la Cola en cualquier tiempo

Sea $V_i(z) = \frac{1}{\mathbb{E}[C_i]}\frac{I_i(z)-1}{z-P_i(z)}$

$$\frac{\partial V_i(z)}{\partial z} = \frac{1}{\mathbb{E}[C_i]}\left[\frac{I_i'(z)(z-P_i(z))}{z-P_i(z)} - \frac{(I_i(z)-1)(1-P_i'(z))}{(z-P_i(z))^2}\right]$$

La FGP para el tiempo de espera para cualquier usuario en la cola está dada por:

$$U_i(z) = \frac{1}{\mathbb{E}[C_i]}\cdot\frac{1-P_i(z)}{z-P_i(z)}\cdot\frac{I_i(z)-1}{1-z}$$

entonces

$$\begin{aligned}
\frac{d}{dz}V_i(z) &= \frac{1}{\mathbb{E}[C_i]}\left\{\frac{d}{dz}\left(\frac{1-P_i(z)}{z-P_i(z)}\right)\frac{I_i(z)-1}{1-z} + \frac{1-P_i(z)}{z-P_i(z)}\frac{d}{dz}\left(\frac{I_i(z)-1}{1-z}\right)\right\} \\
&= \frac{1}{\mathbb{E}[C_i]}\left\{\frac{-P_i(z)(z-P_i(z))-(1-P_i(z))\left(1-P_i'(z)\right)}{(z-P_i(z))^2}\cdot\frac{I_i(z)-1}{1-z}\right\} \\
&+ \frac{1}{\mathbb{E}[C_i]}\left\{\frac{1-P_i(z)}{z-P_i(z)}\cdot\frac{I_i'(z)(1-z)+(I_i(z)-1)}{(1-z)^2}\right\}
\end{aligned}$$

$$\begin{aligned}
\frac{\partial U_i(z)}{\partial z} &= \frac{(-1+I_i[z])(1-P_i[z])}{(1-z)^2\mathbb{E}[I_i](z-P_i[z])} + \frac{(1-P_i[z])I_i'[z]}{(1-z)\mathbb{E}[I_i](z-P_i[z])} - \frac{(-1+I_i[z])(1-P_i[z])(1-P'[z])}{(1-z)\mathbb{E}[I_i](z-P_i[z])^2} \\
&- \frac{(-1+I_i[z])P_i'[z]}{(1-z)\mathbb{E}[I_i](z-P_i[z])}
\end{aligned}$$

36.88. Procesos de Renovación

Definición 36.88.1 *Sean $0 \le T_1 \le T_2 \le \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0,t)$ es*

$$N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \le t), \tag{36.88.1}$$

para $t \ge 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \ge 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 36.88.2 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \ge 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0,t)$*

Nota 36.88.1 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^{n} \xi_k$ y $N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \le t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes Números.*

36.88.1. Propiedades de los Procesos de Renovación

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq & \quad t \quad < T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 36.88.1 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Nota 36.88.2 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 36.88.1 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{36.88.2}$$

$$lim_{t\to\infty} t^{-1} N(t) = 1/\mu, \ c.s. \tag{36.88.3}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 36.88.1 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1} N(t) \to 1/\mu, \ c.s. \ cuando \ t \to \infty. \tag{36.88.4}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 36.88.3 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 36.88.2 *Supóngase que $n^{-1} T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \ c.s. \tag{36.88.5}$$

$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \ c.s. \tag{36.88.6}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 36.88.2 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \ c.s. \ cuando \ t \to \infty. \tag{36.88.7}$$

36.88.2. Función de Renovación

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 36.88.4 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t) = \sum_{n=1}^{\infty} F^{n\star}(t), \ t \geq 0,$$

donde $F^{0\star}(t) = 1\!\!1(t \geq 0)$.

Proposición 36.88.2 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t > 0$, y es $U'(t) = \sum_{n=0}^{\infty} f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t) > N(t-)\} = 0, \ t \geq 0.$$

Definición 36.88.5 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha) = \int_{\mathbb{R}_+} e^{-\alpha t} dF(t), \ \alpha \geq 0.$$

Entonces

$$\hat{U}(\alpha) = \sum_{n=0}^{\infty} F^{\hat{n}\star}(\alpha) = \sum_{n=0}^{\infty} \hat{F}(\alpha)^n = \frac{1}{1-\hat{F}(\alpha)}.$$

Proposición 36.88.3 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha) = \frac{1}{1-\hat{F}(\alpha)}$.*

Nota 36.88.3 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)] = \lambda t$, para $t \geq 0$.*

Teorema 36.88.3 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t) = \mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f : \mathbb{R}_+ \to \mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()} f(T_n)\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista. Además si $X_1, X_2, \ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n | T_n = s] = f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)} X_n\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista.

Corolario 36.88.3 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right] = \mu \mathbb{E}[N(t)+1], \ t \geq 0,$$

36.88.3. Función de Renovación

Definición 36.88.6 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t < 0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t) = h(t) + \int_{[0,t]} H(t-s)\, dF(s), \ t \geq 0, \tag{36.88.8}$$

donde $H(t)$ es una función de valores reales. Esto es $H = h + F \star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t < 0$.

Proposición 36.88.4 *La función $U \star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 36.88.4 (Teorema Renovación Elemental)

$$t^{-1}U(t) \to 1/\mu, \text{ cuando } t \to \infty.$$

36.88.4. Teorema Principal de Renovación

Nota 36.88.4 *Una función $h : \mathbb{R}_+ \to \mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ es decreciente y Riemann Integrable.

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)| \leq b(t)$, donde b es DRI.

Teorema 36.88.5 (Teorema Principal de Renovación) *Si F es no aritmética y $h(t)$ es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty} U \star h = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\, ds.$$

Proposición 36.88.5 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t < 0$ puede expresarse como*

$$H(t) = U \star h(t)\,,\ \textit{donde}\ h(t) = H(t) - F \star H(t)$$

Definición 36.88.7 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}[X(T+t)\,|T] = \mathbb{E}[X(t)]\,,\ \textit{para}\ t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 36.88.6 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}[X(t)] = U \star h(t)\,,\ \textit{donde}\ h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T > t)]\,.$$

Teorema 36.88.6 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M = \sup\{|X(t)| : t \leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}[X(t)] = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\, ds,$$

donde $h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T > t)]$.

36.89. Procesos Regenerativos

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Definición 36.89.1 *Para el proceso $\{(N(t), X(t)) : t \geq 0\}$, sus trayectoria muestrales en el intervalo de tiempo $[T_{n-1}, T_n)$ están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1} + t) : 0 \leq t < \xi_n\})$$

Este ζ_n es el n-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos T_n si sus segmentos ζ_n son independientes e idénticamennte distribuidos.

Observación 36.89.1 *Si $\tilde{X}(t)$ con espacio de estados $\tilde{S}$ es regenerativo sobre T_n, entonces $X(t) = f\left(\tilde{X}(t)\right)$ también es regenerativo sobre T_n, para cualquier función $f : \tilde{S} \to S$.*

Observación 36.89.2 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Definición 36.89.2 (Definición Clásica) *Un proceso estocástico $X = \{X(t) : t \geq 0\}$ es llamado regenerativo is existe una variable aleatoria $R_1 > 0$ tal que*

i) $\{X(t + R_1) : t \geq 0\}$ es independiente de $\{\{X(t) : t < R_1\},\}$

ii) $\{X(t + R_1) : t \geq 0\}$ es estocásticamente equivalente a $\{X(t) : t > 0\}$

Llamamos a R_1 tiempo de regeneración, y decimos que X se regenera en este punto.

$\{X(t+R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Nota 36.89.1 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Definición 36.89.3 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty X(u)\,du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty I_x(u)\,du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\,dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 36.89.2 *a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.*

b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

36.89.1. Procesos Regenerativos Estacionarios

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\{V(t-s) \in A | X_1 > t-s\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones que ocurren en $[0,t]$.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 36.89.4 *Se define el proceso estacionario, $\{V^*(t), t \geq 0\}$, para $\{V(t), t \geq 0\}$ por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]}\int_0^\infty \mathbb{P}\{V(t+x) \in A | X > x\}(1 - F(x))\,dx,$$

para todo $t \geq 0$ y todo conjunto de Borel A.

Definición 36.89.5 *Una modificación medible de un proceso $\{V(t), t \geq 0\}$, es una versión de este, $\{V(t,w)\}$ conjuntamente medible para $t \geq 0$ y para $w \in S$, S espacio de estados para $\{V(t), t \geq 0\}$.*

Teorema 36.89.1 *Sea $\{V(t), t \geq\}$ un proceso regenerativo no negativo con modificación medible. Sea $\mathbb{E}[X] < \infty$. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de t, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$, equivalentemente, si $\mathbb{E}\left[\int_0^X V(s)\,ds\right] < \infty$,entonces

$$\frac{\int_0^t V(s)\,ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$.

36.90. Tiempo de Ciclo Promedio

Consideremos una cola de la red de sistemas de visitas cíclicas fija, Q_l.

Conforme a la definición dada al principio del capítulo, definición (37.8.1), sean $T_1, T_2, \ldots$ los puntos donde las longitudes de las colas de la red de sistemas de visitas cíclicas son cero simultáneamente, cuando la cola Q_l es visitada por el servidor para dar servicio, es decir, $L_1(T_i) = 0, L_2(T_i) = 0, \hat{L}_1(T_i) = 0$ y $\hat{L}_2(T_i) = 0$, a estos puntos se les denominará puntos regenerativos. Entonces,

Definición 36.90.1 *Al intervalo de tiempo entre dos puntos regenerativos se le llamará ciclo regenerativo.*

Definición 36.90.2 *Para T_i se define, M_i, el número de ciclos de visita a la cola Q_l, durante el ciclo regenerativo, es decir, M_i es un proceso de renovación.*

Definición 36.90.3 *Para cada uno de los M_i's, se definen a su vez la duración de cada uno de estos ciclos de visita en el ciclo regenerativo, $C_i^{(m)}$, para $m = 1, 2, \ldots, M_i$, que a su vez, también es n proceso de renovación.*

En nuestra notación $V(t) \equiv C_i$ y $X_i = C_i^{(m)}$ para nuestra segunda definición, mientras que para la primera la notación es: $X(t) \equiv C_i$ y $R_i \equiv C_i^{(m)}$.

Expresion de las Parciales mixtas para F_1 y F_2

1.
$$\frac{\partial}{\partial z_1}\frac{\partial}{\partial z_1}F_1\left(\theta_1\left(\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2), z_2\right)\right)|_{\mathbf{z},\mathbf{w}=1} = 0$$

2.
$$\frac{\partial}{\partial z_2}\frac{\partial}{\partial z_1}F_1\left(\theta_1\left(\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2), z_2\right)\right)|_{\mathbf{z},\mathbf{w}=1} = 0$$

3.
$$\frac{\partial}{\partial w_1}\frac{\partial}{\partial z_1}F_1\left(\theta_1\left(\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2), z_2\right)\right)|_{\mathbf{z},\mathbf{w}=1} = 0$$

4.
$$\frac{\partial}{\partial w_2}\frac{\partial}{\partial z_1}F_1\left(\theta_1\left(\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2), z_2\right)\right)|_{\mathbf{z},\mathbf{w}=1} = 0$$

5.
$$\frac{\partial}{\partial z_1}\frac{\partial}{\partial z_2}F_1\left(\theta_1\left(\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2), z_2\right)\right)|_{\mathbf{z},\mathbf{w}=1} = 0$$

6.
$$\frac{\partial}{\partial z_2}\frac{\partial}{\partial z_2}F_1\left(\theta_1\left(\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right), z_2\right)|_{\mathbf{z},\mathbf{w}=1} = f_1(2,2) + \frac{1}{1-\mu_1}\tilde{P}_2^{(2)}(1)f_1(1)$$
$$+ \quad \tilde{\mu}_2^2\theta_1^{(2)}(1)f_1(1) + 2\frac{\tilde{\mu}_2}{1-\mu_1}f_1(1,2) + \left(\frac{\tilde{\mu}_2}{1-\mu_1}\right)^2 f_1(1,1)$$

Introducción

Un sistema de visitas (Polling System) consiste en una cola a la cuál llegan los usuarios para ser atendidos por uno o varios servidores de acuerdo a una política determinada, en la cual se puede asumir que la manera en que los usuarios llegan a la misma es conforme a un proceso Poisson con tasa de llegada μ. De igual manera se puede asumir que la distribución de los servicios a cada uno de los usuarios presentes en la cola es conforme a una variable aleatoria exponencial. Esto es la base para la conformación de los Sistemas de Visitas Cíclicas, de los cuales es posible obtener sus Funciones Generadoras de Probabilidades, primeros y segundos momentos así como medidas de desempeño que permiten tener una mejor descripción del funcionamiento del sistema en cualquier momento t asumiendo estabilidad.

Objetivos Principales

- Encontrar las ecuaciones que modelan el comportamiento de una Red de Sistemas de Visitas Cíclicas (RSVC) con propiedades similares.
- Encontrar expresiones analíticas para las longitudes de las colas al momento en que el servidor llega a una de ellas para comenzar a dar servicio, así como de sus segundos momentos.
- Determinar las principales medidas de Desempeño para la RSVC tales como: Número de usuarios presentes en cada una de las colas del sistema cuando uno de los servidores está presente atendiendo, Tiempos que transcurre entre las visitas del servidor a la misma cola.

Descripción de la Red de Sistemas de Visitas Cíclicas

El uso de la Función Generadora de Probabilidades (FGP's) nos permite determinar las Funciones de Distribución de Probabilidades Conjunta de manera indirecta sin necesidad de hacer uso de las propiedades de las distribuciones de probabilidad de cada uno de los procesos que intervienen en la Red de Sistemas de Visitas Cíclicas.

- Se definen los procesos para los arribos para cada una de las colas:$X_i(t)$ y $\hat{X}_i(t)$. Y para los usuarios que se trasladan de un sistema a otro se tiene el proceso $Y(t)$,
- En lo que respecta al servidor, en términos de los tiempos de visita a cada una de las colas, se definen las variables aleatorias τ_1,τ_2 para Q_1,Q_2 respectivamente; y ζ_1,ζ_2 para $\hat{Q}_1,\hat{Q}_2$ del sistema 2.
- A los tiempos en que el servidor termina de atender en las colas $Q_1,Q_2,\hat{Q}_1,\hat{Q}_2$, se les denotará por $\overline{\tau}_1,\overline{\tau}_2,\overline{\zeta}_1,\overline{\zeta}_2$ respectivamente.
- Los tiempos de traslado del servidor desde el momento en que termina de atender a una cola y llega a la siguiente para comenzar a dar servicio están dados por $\tau_2-\overline{\tau}_1,\tau_1-\overline{\tau}_2$ y $\zeta_2-\overline{\zeta}_1,\zeta_1-\overline{\zeta}_2$ para el sistema 1 y el sistema 2, respectivamente.

Cada uno de estos procesos con su respectiva FGP. Además, para cada una de las colas en cada sistema, el número de usuarios al tiempo en que llega el servidor a dar servicio está dado por el número de usuarios presentes en la cola al tiempo t, más el número de usuarios que llegan a la cola en el intervalo de tiempo $[\tau_i,\overline{\tau}_i]$, es decir

$$L_1(\overline{\tau}_1)=L_1(\tau_1)+X_1(\overline{\tau}_1-\tau_1),\hat{L}_i(\overline{\tau}_i)=\hat{L}_i(\tau_i)+\hat{X}_i(\overline{\tau}_i-\tau_i),L_2(\overline{\tau}_1)=L_2(\tau_1)+X_2(\overline{\tau}_1-\tau_1)+Y_2(\overline{\tau}_1-\tau_1),$$

Una vez definidas las Funciones Generadoras de Probabilidades Conjuntas se construyen las ecuaciones recursivas que permiten obtener la información sobre la longitud de cada una de las colas, al momento en que uno de los servidores llega a una de las colas para dar servicio, basándose en la información que se tiene sobre su llegada a la

cola inmediata anterior.

$$\begin{aligned}
F_2(z_1,z_2,w_1,w_2) &= R_1\left(P_1(z_1)\tilde{P}_2(z_2)\prod_{i=1}^{2}\hat{P}_i(w_i)\right)F_1\left(\theta_1\left(\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right),z_2,w_1,w_2\right),\\
F_1(z_1,z_2,w_1,w_2) &= R_2\left(P_1(z_1)\tilde{P}_2(z_2)\prod_{i=1}^{2}\hat{P}_i(w_i)\right)F_2\left(z_1,\tilde{\theta}_2\left(P_1(z_1)\hat{P}_1(w_1)\hat{P}_2(w_2)\right),w_1,w_2\right),\\
\hat{F}_2(z_1,z_2,w_1,w_2) &= \hat{R}_1\left(P_1(z_1)\tilde{P}_2(z_2)\prod_{i=1}^{2}\hat{P}_i(w_i)\right)\hat{F}_1\left(z_1,z_2,\hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right),w_2\right),\\
\hat{F}_1(z_1,z_2,w_1,w_2) &= \hat{R}_2\left(P_1(z_1)\tilde{P}_2(z_2)\prod_{i=1}^{2}\hat{P}_i(w_i)\right)\hat{F}_2\left(z_1,z_2,w_1,\hat{\theta}_2\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\right)\right).
\end{aligned}$$

Resultado Principal

Sean $\mu_1,\mu_2,\check{\mu}_2,\hat{\mu}_1,\hat{\mu}_2$ y $\tilde{\mu}_2=\mu_2+\check{\mu}_2$ los valores esperados de los proceso definidos anteriormente, y sean $r_1,r_2,\hat{r}_1$ y $\hat{r}_2$ los valores esperado s de los tiempos de traslado del servidor entre las colas para cada uno de los sistemas de visitas cíclicas. Si se definen $\mu=\mu_1+\tilde{\mu}_2$, $\hat{\mu}=\hat{\mu}_1+\hat{\mu}_2$, y $r=r_1+r_2$ y $\hat{r}=\hat{r}_1+\hat{r}_2$, entonces se tiene el siguiente resultado.

Teorema 36.90.1 *Supongamos que $\mu<1$, $\hat{\mu}<1$, entonces, el número de usuarios presentes en cada una de las colas que conforman la Red de Sistemas de Visitas Cíclicas cuando uno de los servidores visita a alguna de ellas está dada por la solución del Sistema de Ecuaciones Lineales presentados arriba cuyas expresiones damos a continuación:*

$$\begin{array}{lll}
f_1(1)=r\frac{\mu_1(1-\mu_1)}{1-\mu}, & f_1(2)=r_2\tilde{\mu}_2, & f_1(3)=\hat{\mu}_1\left(\frac{r_2\mu_2+1}{\mu_2}+r\frac{\tilde{\mu}_2}{1-\mu}\right),\\
f_1(4)=\hat{\mu}_2\left(\frac{r_2\mu_2+1}{\mu_2}+r\frac{\tilde{\mu}_2}{1-\mu}\right), & f_2(1)=r_1\mu_1, & f_2(2)=r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu},\\
f_2(3)=\hat{\mu}_1\left(\frac{r_1\mu_1+1}{\mu_1}+r\frac{\mu_1}{1-\mu}\right), & f_2(4)=\hat{\mu}_2\left(\frac{r_1\mu_1+1}{\mu_1}+r\frac{\mu_1}{1-\mu}\right), & \hat{f}_1(1)=\mu_1\left(\frac{\hat{r}_2\hat{\mu}_2+1}{\hat{\mu}_2}+\hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right),\\
\hat{f}_1(2)=\tilde{\mu}_2\left(\hat{r}_2+\hat{r}\frac{\hat{\mu}_2}{1-\hat{\mu}}\right)+\frac{\mu_2}{\hat{\mu}_2}, & \hat{f}_1(3)=\hat{r}\frac{\hat{\mu}_1(1-\hat{\mu}_1)}{1-\hat{\mu}}, & \hat{f}_1(4)=\hat{r}_2\hat{\mu}_2,\\
\hat{f}_2(1)=\mu_1\left(\frac{\hat{r}_1\hat{\mu}_1+1}{\hat{\mu}_1}+\hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right), & \hat{f}_2(2)=\tilde{\mu}_2\left(\hat{r}_1+\hat{r}\frac{\hat{\mu}_1}{1-\hat{\mu}}\right)+\frac{\hat{\mu}_2}{\hat{\mu}_1}, & \hat{f}_2(3)=\hat{r}_1\hat{\mu}_1,\\
 & \hat{f}_2(4)=\hat{r}\frac{\hat{\mu}_2(1-\hat{\mu}_2)}{1-\hat{\mu}}. &
\end{array}$$

Las ecuaciones que determinan los segundos momentos de las longitudes de las colas de los dos sistemas se pueden ver en este sitio

Medidas de Desempeño

Definición 36.90.4 *Sea L_i^*el número de usuarios cuando el servidor visita la cola Q_i para dar servicio, para $i=1,2$.*

Entonces

Proposición 36.90.1 *Para la cola Q_i, $i=1,2$, se tiene que el número de usuarios presentes al momento de ser visitada por el servidor está dado por*

$$\mathbb{E}[L_i^*] = f_i(i) \tag{36.90.1}$$

$$Var[L_i^*] = f_i(i,i)+\mathbb{E}[L_i^*]-\mathbb{E}[L_i^*]^2. \tag{36.90.2}$$

Definición 36.90.5 *El tiempo de Ciclo C_i es el periodo de tiempo que comienza cuando la cola i es visitada por primera vez en un ciclo, y termina cuando es visitado nuevamente en el próximo ciclo, bajo condiciones de estabilidad.*

$$C_i(z)=\mathbb{E}\left[z^{\overline{\tau}_i(m+1)-\overline{\tau}_i(m)}\right]$$

Definición 36.90.6 *El tiempo de intervisita I_i es el periodo de tiempo que comienza cuando se ha completado el servicio en un ciclo y termina cuando es visitada nuevamente en el próximo ciclo.*

$$I_i(z) = \mathbb{E}\left[z^{\tau_i(m+1)-\overline{\tau}_i(m)}\right]$$

Proposición 36.90.2 *Para los tiempos de intervisita del servidor I_i, se tiene que*

$$\begin{aligned}\mathbb{E}[I_i] &= \frac{f_i(i)}{\mu_i},\\ Var[I_i] &= \frac{Var[L_i^*]}{\mu_i^2} - \frac{\sigma_i^2}{\mu_i^2} f_i(i).\end{aligned}$$

Proposición 36.90.3 *Para los tiempos que ocupa el servidor para atender a los usuarios presentes en la cola Q_i, con FGP denotada por S_i, se tiene que*

$$\begin{aligned}\mathbb{E}[S_i] &= \frac{\mathbb{E}[L_i^*]}{1-\mu_i} = \frac{f_i(i)}{1-\mu_i},\\ Var[S_i] &= \frac{Var[L_i^*]}{(1-\mu_i)^2} + \frac{\sigma^2 \mathbb{E}[L_i^*]}{(1-\mu_i)^3}\end{aligned}$$

Proposición 36.90.4 *Para la duración de los ciclos C_i se tiene que*

$$\begin{aligned}\mathbb{E}[C_i] &= \mathbb{E}[I_i]\,\mathbb{E}[\theta_i(z)] = \frac{\mathbb{E}[L_i^*]}{\mu_i}\frac{1}{1-\mu_i} = \frac{f_i(i)}{\mu_i(1-\mu_i)}\\ Var[C_i] &= \frac{Var[L_i^*]}{\mu_i^2(1-\mu_i)^2}.\end{aligned}$$

Conjeturas

Definición 36.90.7 *Dada una cola Q_i, sea $\mathcal{L} = \left\{L_1(t), L_2(t), \hat{L}_1(t), \hat{L}_2(t)\right\}$ las longitudes de todas las colas de la Red de Sistemas de Visitas Cíclicas. Supóngase que el servidor visita Q_i, si $L_i(t) = 0$ y $\hat{L}_i(t) = 0$ para $i = 1, 2$, entonces los elementos de $\mathcal{L}$ son puntos regenerativos.*

Definición 36.90.8 *Un ciclo regenerativo es el intervalo de tiempo que ocurre entre dos puntos regenerativos sucesivos, $\mathcal{L}_1, \mathcal{L}_2$.*

Defínanse los puntos de regenaración en el proceso $[L_1(t), L_2(t), \ldots, L_N(t)]$. Los puntos cuando la cola i es visitada y todos los $L_j(\tau_i(m)) = 0$ para $i = 1, 2$ son puntos de regeneración. Se llama ciclo regenerativo al intervalo entre dos puntos regenerativos sucesivos.

Sea M_i el número de ciclos de visita en un ciclo regenerativo, y sea $C_i^{(m)}$, para $m = 1, 2, \ldots, M_i$ la duración del m-ésimo ciclo de visita en un ciclo regenerativo. Se define el ciclo del tiempo de visita promedio $\mathbb{E}[C_i]$ como

$$\mathbb{E}[C_i] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right]}{\mathbb{E}[M_i]}$$

En Stid72 y Heym82 se muestra que una condición suficiente para que el proceso regenerativo estacionario sea un procesoo estacionario es que el valor esperado del tiempo del ciclo regenerativo sea finito:

$$\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right] < \infty.$$

como cada $C_i^{(m)}$ contiene intervalos de réplica positivos, se tiene que $\mathbb{E}[M_i] < \infty$, además, como $M_i > 0$, se tiene que la condición anterior es equivalente a tener que

$$\mathbb{E}[C_i] < \infty,$$

por lo tanto una condición suficiente para la existencia del proceso regenerativo está dada por

$$\sum_{k=1}^{N} \mu_k < 1.$$

Sea la función generadora de momentos para L_i, el número de usuarios en la cola $Q_i(z)$ en cualquier momento, está dada por el tiempo promedio de $z^{L_i(t)}$ sobre el ciclo regenerativo definido anteriormente:

$$Q_i(z) = \mathbb{E}\left[z^{L_i(t)}\right] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i}\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}\left[\sum_{m=1}^{M_i}\tau_i(m+1)-\tau_i(m)\right]}$$

M_i es un tiempo de paro en el proceso regenerativo con $\mathbb{E}[M_i] < \infty$, se sigue del lema de Wald que:

$$\begin{aligned}
\mathbb{E}\left[\sum_{m=1}^{M_i}\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}[M_i]\,\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] \\
\mathbb{E}\left[\sum_{m=1}^{M_i}\tau_i(m+1)-\tau_i(m)\right] &= \mathbb{E}[M_i]\,\mathbb{E}[\tau_i(m+1)-\tau_i(m)]
\end{aligned}$$

por tanto se tiene que

$$Q_i(z) = \frac{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}[\tau_i(m+1)-\tau_i(m)]}$$

observar que el denominador es simplemente la duración promedio del tiempo del ciclo.

Se puede demostrar (ver Hideaki Takagi 1986) que

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = z\frac{F_i(z)-1}{z-P_i(z)}$$

Durante el tiempo de intervisita para la cola i, $L_i(t)$ solamente se incrementa de manera que el incremento por intervalo de tiempo está dado por la función generadora de probabilidades de $P_i(z)$, por tanto la suma sobre el tiempo de intervisita puede evaluarse como:

$$\begin{aligned}
\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} \{P_i(z)\}^{t-\overline{\tau}_i(m)}\right] \\
&= \frac{1-\mathbb{E}\left[\{P_i(z)\}^{\tau_i(m+1)-\overline{\tau}_i(m)}\right]}{1-P_i(z)} = \frac{1-I_i[P_i(z)]}{1-P_i(z)}
\end{aligned}$$

por tanto

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = \frac{1-F_i(z)}{1-P_i(z)}$$

Haciendo uso de lo hasta ahora desarrollado se tiene que

$$\begin{aligned}
Q_i(z) &= \frac{1}{\mathbb{E}[C_i]}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)} \\
&= \frac{\mu_i(1-\mu_i)}{f_i(i)}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)}
\end{aligned}$$

derivando con respecto a z

$$\begin{aligned}
\frac{dQ_i(z)}{dz} &= \frac{(1-F_i(z))P_i(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\
&- \frac{(1-z)P_i(z)F_i'(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\
&- \frac{(1-z)(1-F_i(z))P_i(z)\left(P_i'(z)-1\right)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)^2} \\
&+ \frac{(1-z)(1-F_i(z))P_i'(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\
&+ \frac{(1-z)(1-F_i(z))P_i(z)P_i'(z)}{\mathbb{E}[C_i](1-P_i(z))^2(P_i(z)-z)}
\end{aligned}$$

Calculando el límite cuando $z \to 1^+$:

$$
\begin{aligned}
Q_i^{(1)}(z) &= lim_{z\to 1^+} \frac{dQ_i(z)}{dz} && (36.90.3)\\
&= lim_{z\to 1} \frac{(1-F_i(z))\,P_i(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} && (36.90.4)\\
&- lim_{z\to 1^+} \frac{(1-z)\,P_i(z)\,F_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} && (36.90.5)\\
&- lim_{z\to 1^+} \frac{(1-z)(1-F_i(z))\,P_i(z)\left(P_i^{'}(z)-1\right)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)^2} && (36.90.6)\\
&+ lim_{z\to 1^+} \frac{(1-z)(1-F_i(z))\,P_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} && (36.90.7)\\
&+ lim_{z\to 1^+} \frac{(1-z)(1-F_i(nz))\,P_i(z)\,P_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))^2(P_i(z)-z)} && (36.90.8)
\end{aligned}
$$

Entonces:

$$
\begin{aligned}
& lim_{z\to 1^+} \frac{(1-F_i(z))\,P_i(z)}{(1-P_i(z))(P_i(z)-z)} = lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-F_i(z))\,P_i(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))(-z+P_i(z))\right]}\\
= \; & lim_{z\to 1^+} \frac{-P_i(z)\,F_i^{'}(z)+(1-F_i(z))\,P_i^{'}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))\,P_i^{'}(z)}
\end{aligned}
$$

$$
\begin{aligned}
& lim_{z\to 1^+} \frac{(1-z)\,P_i(z)\,F_i^{'}(z)}{(1-P_i(z))(P_i(z)-z)} = lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)\,P_i(z)\,F_i^{'}(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))(P_i(z)-z)\right]}\\
= \; & lim_{z\to 1^+} \frac{-P_i(z)\,F_i^{'}(z)+(1-z)F_i^{'}(z)\,P_i^{'}(z)+(1-z)P_i(z)\,F_i^{''}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))\,P_i^{'}(z)}
\end{aligned}
$$

$$
\begin{aligned}
& lim_{z\to 1^+} \frac{(1-z)(1-F_i(z))\,P_i(z)\left(P_i^{'}(z)-1\right)}{(1-P_i(z))(P_i(z)-z)^2}\\
= \; & lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)(1-F_i(z))\,P_i(z)\left(P_i^{'}(z)-1\right)\right]}{\frac{d}{dz}\left[(1-P_i(z))(P_i(z)-z)^2\right]}\\
= \; & lim_{z\to 1^+} \frac{-(1-F_i(z))\,P_i(z)\left(-1+P_i^{'}(z)\right)-(1-z)P_i(z)\,F_i^{'}(z)\left(-1+P_i^{'}(z)\right)}{2(1-P_i(z))(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2\,P_i^{'}(z)}\\
+ \; & lim_{z\to 1^+} \frac{+(1-z)(1-F_i(z))\left(-1+P_i^{'}(z)\right)P_i^{'}(z)}{2(1-P_i(z))(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2\,P_i^{'}(z)}\\
+ \; & lim_{z\to 1^+} \frac{+(1-z)(1-F_i(z))\,P_i(z)\,P_i^{''}(z)}{2(1-P_i(z))(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2\,P_i^{'}(z)}
\end{aligned}
$$

$$
\begin{aligned}
& lim_{z\to 1^+} \frac{(1-z)(1-F_i(z))\,P_i^{'}(z)}{(1-P_i(z))(P_i(z)-z)} = lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)(1-F_i(z))\,P_i^{'}(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))(P_i(z)-z)\right]}\\
= \; & lim_{z\to 1^+} \frac{-(1-F_i(z))\,P_i^{'}(z)-(1-z)F_i^{'}(z)\,P_i^{'}(z)+(1-z)(1-F_i(z))\,P_i^{''}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))\,P_i^{'}(z)}
\end{aligned}
$$

$$
\begin{aligned}
& lim_{z\to 1^+} \frac{(1-z)(1-F_i(z))\,P_i(z)\,P_i^{'}(z)}{(1-P_i(z))^2(P_i(z)-z)}\\
= \; & lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)(1-F_i(z))\,P_i(z)\,P_i^{'}(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))^2(P_i(z)-z)\right]}\\
= \; & lim_{z\to 1^+} \frac{-(1-F_i(z))\,P_i(z)\,P_i^{'}(z)-(1-z)P_i(z)\,F_i^{'}(z)\,P_i^{'}[z]}{(1-P_i(z))^2\left(-1+P_i^{'}(z)\right)-2(1-P_i(z))(-z+P_i(z))\,P_i^{'}(}
\end{aligned}
$$

$+\lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i^{'}(z)^2+(1-z)(1-F_i(z))P_i(z)P_i^{''}(z)}{(1-P_i(z))^2\left(-1+P_i^{'}(z)\right)-2(1-P_i(z))(-z+P_i(z))P_i^{'}(z)}$

36.90.5. Longitudes de la Cola en cualquier tiempo

Sea $V_i(z)=\frac{1}{\mathbb{E}[C_i]}\frac{I_i(z)-1}{z-P_i(z)}$

$$\frac{\partial V_i(z)}{\partial z} = \frac{1}{\mathbb{E}[C_i]}\left[\frac{I_i{}'(z)(z-P_i(z))}{z-P_i(z)}-\frac{(I_i(z)-1)(1-P_i{}'(z))}{(z-P_i(z))^2}\right]$$

La FGP para el tiempo de espera para cualquier usuario en la cola está dada por:

$$U_i(z)=\frac{1}{\mathbb{E}[C_i]}\cdot\frac{1-P_i(z)}{z-P_i(z)}\cdot\frac{I_i(z)-1}{1-z}$$

entonces

$$\begin{aligned}
\frac{d}{dz}V_i(z) &= \frac{1}{\mathbb{E}[C_i]}\left\{\frac{d}{dz}\left(\frac{1-P_i(z)}{z-P_i(z)}\right)\frac{I_i(z)-1}{1-z}+\frac{1-P_i(z)}{z-P_i(z)}\frac{d}{dz}\left(\frac{I_i(z)-1}{1-z}\right)\right\}\\
&= \frac{1}{\mathbb{E}[C_i]}\left\{\frac{-P_i(z)(z-P_i(z))-(1-P_i(z))\left(1-P_i^{'}(z)\right)}{(z-P_i(z))^2}\cdot\frac{I_i(z)-1}{1-z}\right\}\\
&+ \frac{1}{\mathbb{E}[C_i]}\left\{\frac{1-P_i(z)}{z-P_i(z)}\cdot\frac{I_i^{'}(z)(1-z)+(I_i(z)-1)}{(1-z)^2}\right\}
\end{aligned}$$

$$\begin{aligned}
\frac{\partial U_i(z)}{\partial z} &= \frac{(-1+I_i[z])(1-P_i[z])}{(1-z)^2\mathbb{E}[I_i](z-P_i[z])}+\frac{(1-P_i[z])I_i^{'}[z]}{(1-z)\mathbb{E}[I_i](z-P_i[z])}\\
&- \frac{(-1+I_i[z])(1-P_i[z])(1-P'[z])}{(1-z)\mathbb{E}[I_i](z-P_i[z])^2}-\frac{(-1+I_i[z])P_i{}'[z]}{(1-z)\mathbb{E}[I_i](z-P_i[z])}
\end{aligned}$$

CAPÍTULO 37

Thorisson

37.1. Existencia de Tiempos de Regeneración

37.1.1. Procesos Regenerativos: Thorisson

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Definición 37.1.1 *Un elemento aleatorio en un espacio medible $(E, \mathcal{E})$ en un espacio de probabilidad $(\Omega, \mathcal{F}, \mathbb{P})$ a $(E, \mathcal{E})$, es decir, para $A \in \mathcal{E}$, se tiene que $\{Y \in A\} \in \mathcal{F}$, donde $\{Y \in A\} := \{w \in \Omega : Y(w) \in A\} =: Y^{-1}A$.*

Nota 37.1.1 *También se dice que Y está soportado por el espacio de probabilidad $(\Omega, \mathcal{F}, \mathbb{P})$ y que Y es un mapeo medible de Ω en E, es decir, es $\mathcal{F}/\mathcal{E}$ medible.*

Definición 37.1.2 *Para cada $i \in \mathbb{I}$ sea P_i una medida de probabilidad en un espacio medible $(E_i, \mathcal{E}_i)$. Se define el espacio producto $\otimes_{i\in\mathbb{I}}(E_i, \mathcal{E}_i) := \left(\prod_{i\in\mathbb{I}} E_i, \otimes_{i\in\mathbb{I}}\mathcal{E}_i\right)$, donde $\prod_{i\in\mathbb{I}} E_i$ es el producto cartesiano de los E_i's, y $\otimes_{i\in\mathbb{I}}\mathcal{E}_i$ es la σ-álgebra producto, es decir, es la σ-álgebra más pequeña en $\prod_{i\in\mathbb{I}} E_i$ que hace al i-ésimo mapeo proyección en E_i medible para toda $i \in \mathbb{I}$ es la σ-álgebra inducida por los mapeos proyección.*

$$\otimes_{i\in\mathbb{I}}\mathcal{E}_i := \sigma\left\{\{y : y_i \in A\} : i \in \mathbb{I} \text{ y } A \in \mathcal{E}_i\right\}.$$

Definición 37.1.3 *Un espacio de probabilidad $\left(\tilde{\Omega}, \tilde{\mathcal{F}}, \tilde{\mathbb{P}}\right)$ es una extensión de otro espacio de probabilidad $(\Omega, \mathcal{F}, \mathbb{P})$ si $\left(\tilde{\Omega}, \tilde{\mathcal{F}}, \tilde{\mathbb{P}}\right)$ soporta un elemento aleatorio $\xi \in (\Omega, \mathcal{F})$ que tienen a $\mathbb{P}$ como distribución.*

Teorema 37.1.1 *Sea $\mathbb{I}$ un conjunto de índices arbitrario. Para cada $i \in \mathbb{I}$ sea P_i una medida de probabilidad en un espacio medible $(E_i, \mathcal{E}_i)$. Entonces existe una única medida de probabilidad $\otimes_{i\in\mathbb{I}}P_i$ en $\otimes_{i\in\mathbb{I}}(E_i, \mathcal{E}_i)$ tal que*

$$\otimes_{i\in\mathbb{I}}P_i\left(y \in \prod_{i\in\mathbb{I}} E_i : y_i \in A_{i_1}, \ldots, y_n \in A_{i_n}\right) = P_{i_1}(A_{i_n}) \cdots P_{i_n}(A_{i_n})$$

para todos los enteros $n > 0$, toda $i_1, \ldots, i_n \in \mathbb{I}$ y todo $A_{i_1} \in \mathcal{E}_{i_1}, \ldots, A_{i_n} \in \mathcal{E}_{i_n}$

La medida $\otimes_{i\in\mathbb{I}}P_i$ es llamada la medida producto y $\otimes_{i\in\mathbb{I}}(E_i, \mathcal{E}_i, P_i) := \left(\prod_{i\in\mathbb{I}}, E_i, \otimes_{i\in\mathbb{I}}\mathcal{E}_i, \otimes_{i\in\mathbb{I}}P_i\right)$, es llamado espacio de probabilidad producto.

Definición 37.1.4 *Un espacio medible $(E, \mathcal{E})$ es Polaco si existe una métrica en E tal que E es completo, es decir cada sucesión de Cauchy converge a un límite en E, y separable, E tienen un subconjunto denso numerable, y tal que $\mathcal{E}$ es generado por conjuntos abiertos.*

Definición 37.1.5 *Dos espacios medibles $(E, \mathcal{E})$ y $(G, \mathcal{G})$ son Borel equivalentes isomorfos si existe una biyección $f : E \to G$ tal que f es $\mathcal{E}/\mathcal{G}$ medible y su inversa f^{-1} es $\mathcal{G}/\mathcal{E}$ medible. La biyección es una equivalencia de Borel.*

Definición 37.1.6 *Un espacio medible $(E,\mathcal{E})$ es un espacio estándar si es Borel equivalente a $(G,\mathcal{G})$, donde G es un subconjunto de Borel de $[0,1]$ y $\mathcal{G}$ son los subconjuntos de Borel de G.*

Nota 37.1.2 *Cualquier espacio Polaco es un espacio estándar.*

Definición 37.1.7 *Un proceso estocástico con conjunto de índices $\mathbb{I}$ y espacio de estados $(E,\mathcal{E})$ es una familia $Z=(\mathbb{Z}_s)_{s\in\mathbb{I}}$ donde $\mathbb{Z}_s$ son elementos aleatorios definidos en un espacio de probabilidad común $(\Omega,\mathcal{F},\mathbb{P})$ y todos toman valores en $(E,\mathcal{E})$.*

Definición 37.1.8 *Un proceso estocástico one-sided contiuous time (**PEOSCT**) es un proceso estocástico con conjunto de índices $\mathbb{I}=[0,\infty)$.*

Sea $\left(E^{\mathbb{I}},\mathcal{E}^{\mathbb{I}}\right)$ denota el espacio producto $\left(E^{\mathbb{I}},\mathcal{E}^{\mathbb{I}}\right):=\otimes_{s\in\mathbb{I}}(E,\mathcal{E})$. Vamos a considerar $\mathbb{Z}$ como un mapeo aleatorio, es decir, como un elemento aleatorio en $\left(E^{\mathbb{I}},\mathcal{E}^{\mathbb{I}}\right)$ definido por $Z(w)=(Z_s(w))_{s\in\mathbb{I}}$ y $w\in\Omega$.

Nota 37.1.3 *La distribución de un proceso estocástico Z es la distribución de Z como un elemento aleatorio en $\left(E^{\mathbb{I}},\mathcal{E}^{\mathbb{I}}\right)$. La distribución de Z esta determinada de manera única por las distribuciones finito dimensionales.*

Nota 37.1.4 *En particular cuando Z toma valores reales, es decir, $(E,\mathcal{E})=(\mathbb{R},\mathcal{B})$ las distribuciones finito dimensionales están determinadas por las funciones de distribución finito dimensionales*

$$\mathbb{P}\left(Z_{t_1}\leq x_1,\ldots,Z_{t_n}\leq x_n\right),x_1,\ldots,x_n\in\mathbb{R},t_1,\ldots,t_n\in\mathbb{I},n\geq 1. \tag{37.1.1}$$

Nota 37.1.5 *Para espacios polacos $(E,\mathcal{E})$ el Teorema de Consistencia de Kolmogorov asegura que dada una colección de distribuciones finito dimensionales consistentes, siempre existe un proceso estocástico que posee tales distribuciones finito dimensionales.*

Definición 37.1.9 *Las trayectorias de Z son las realizaciones $Z(w)$ para $w\in\Omega$ del mapeo aleatorio Z.*

Nota 37.1.6 *Algunas restricciones se imponen sobre las trayectorias, por ejemplo que sean continuas por la derecha, o continuas por la derecha con límites por la izquierda, o de manera más general, se pedirá que caigan en algún subconjunto H de $E^{\mathbb{I}}$. En este caso es natural considerar a Z como un elemento aleatorio que no está en $\left(E^{\mathbb{I}},\mathcal{E}^{\mathbb{I}}\right)$ sino en $(H,\mathcal{H})$, donde $\mathcal{H}$ es la σ-álgebra generada por los mapeos proyección que toman a $z\in H$ a $z_t\in E$ para $t\in\mathbb{I}$. A $\mathcal{H}$ se le conoce como la traza de H en $E^{\mathbb{I}}$, es decir,*

$$\mathcal{H}:=E^{\mathbb{I}}\cap H:=\left\{A\cap H:A\in E^{\mathbb{I}}\right\}. \tag{37.1.2}$$

Nota 37.1.7 *Z tiene trayectorias con valores en H y cada Z_t es un mapeo medible de $(\Omega,\mathcal{F})$ a $(H,\mathcal{H})$. Cuando se considera un espacio de trayectorias en particular H, al espacio $(H,\mathcal{H})$ se le llama el espacio de trayectorias de Z.*

Nota 37.1.8 *La distribución del proceso estocástico Z con espacio de trayectorias $(H,\mathcal{H})$ es la distribución de Z como un elemento aleatorio en $(H,\mathcal{H})$. La distribución, nuevemente, está determinada de manera única por las distribuciones finito dimensionales.*

Definición 37.1.10 *Sea Z un PEOSCT con espacio de estados $(E,\mathcal{E})$ y sea T un tiempo aleatorio en $[0,\infty)$. Por Z_T se entiende el mapeo con valores en E definido en Ω en la manera obvia:*

$$Z_T(w):=Z_{T(w)}(w).w\in\Omega.$$

Definición 37.1.11 *Un PEOSCT Z es conjuntamente medible (**CM**) si el mapeo que toma $(w,t)\in\Omega\times[0,\infty)$ a $Z_t(w)\in E$ es $\mathcal{F}\otimes\mathcal{B}[0,\infty)/\mathcal{E}$ medible.*

Nota 37.1.9 *Un PEOSCT-CM implica que el proceso es medible, dado que Z_T es una composición de dos mapeos continuos: el primero que toma w en $(w,T(w))$ es $\mathcal{F}/\mathcal{F}\otimes\mathcal{B}[0,\infty)$ medible, mientras que el segundo toma $(w,T(w))$ en $Z_{T(w)}(w)$ es $\mathcal{F}\otimes\mathcal{B}[0,\infty)/\mathcal{E}$ medible.*

Definición 37.1.12 *Un PEOSCT con espacio de estados $(H,\mathcal{H})$ es canónicamente conjuntamente medible (**CCM**) si el mapeo $(z,t)\in H\times[0,\infty)$ en $Z_t\in E$ es $\mathcal{H}\otimes\mathcal{B}[0,\infty)/\mathcal{E}$ medible.*

Nota 37.1.10 *Un PEOSCTCCM implica que el proceso es CM, dado que un PECCM Z es un mapeo de $\Omega\times[0,\infty)$ a E, es la composición de dos mapeos medibles: el primero, toma (w,t) en $(Z(w),t)$ es $\mathcal{F}\otimes\mathcal{B}[0,\infty)/\mathcal{H}\otimes\mathcal{B}[0,\infty)$ medible, y el segundo que toma $(Z(w),t)$ en $Z_t(w)$ es $\mathcal{H}\otimes\mathcal{B}[0,\infty)/\mathcal{E}$ medible. Por tanto CCM es una condición más fuerte que CM.*

Definición 37.1.13 *Un conjunto de trayectorias H de un PEOSCT Z, es internamente shift-invariante (**ISI**) si*

$$\left\{(z_{t+s})_{s\in[0,\infty)} : z \in H\right\} = H,\ t \in [0,\infty).$$

Definición 37.1.14 *Dado un PEOSCTISI, se define el mapeo-shift θ_t, $t \in [0,\infty)$, de H a H por*

$$\theta_t z = (z_{t+s})_{s\in[0,\infty)},\ z \in H.$$

Definición 37.1.15 *Se dice que un proceso Z es shift-medible (**SM**) si Z tiene un conjunto de trayectorias H que es ISI y además el mapeo que toma $(z,t) \in H \times [0,\infty)$ en $\theta_t z \in H$ es $\mathcal{H} \otimes \mathcal{B}[0,\infty)/\mathcal{H}$ medible.*

Nota 37.1.11 *Un proceso estocástico con conjunto de trayectorias H ISI es shift-medible si y sólo si es CCM*

Nota 37.1.12
- *Dado el espacio polaco $(E,\mathcal{E})$ se tiene el conjunto de trayectorias $D_E[0,\infty)$ que es ISI, entonces cumpe con ser CCM.*
- *Si G es abierto, podemos cubrirlo por bolas abiertas cuay cerradura este contenida en G, y como G es segundo numerable como subespacio de E, lo podemos cubrir por una cantidad numerable de bolas abiertas.*

Nota 37.1.13 *Los procesos estocásticos Z a tiempo discreto con espacio de estados polaco, también tiene un espacio de trayectorias polaco y por tanto tiene distribuciones condicionales regulares.*

Teorema 37.1.2 *El producto numerable de espacios polacos es polaco.*

Definición 37.1.16 *Sea $(\Omega,\mathcal{F},\mathbb{P})$ espacio de probabilidad que soporta al proceso $Z = (Z_s)_{s\in[0,\infty)}$ y $S = (S_k)_0^\infty$ donde Z es un PEOSCTM con espacio de estados $(E,\mathcal{E})$ y espacio de trayectorias $(H,\mathcal{H})$ y además S es una sucesión de tiempos aleatorios one-sided que satisfacen la condición $0 \le S_0 < S_1 < \cdots \to \infty$. Considerando S como un mapeo medible de $(\Omega,\mathcal{F})$ al espacio sucesión $(L,\mathcal{L})$, donde*

$$L = \left\{(s_k)_0^\infty \in [0,\infty)^{\{0,1,\ldots\}} : s_0 < s_1 < \cdots \to \infty\right\},$$

donde $\mathcal{L}$ son los subconjuntos de Borel de L, es decir, $\mathcal{L} = L \cap \mathcal{B}^{\{0,1,\ldots\}}$.

Así el par (Z,S) es un mapeo medible de $(\Omega,\mathcal{F})$ en $(H \times L, \mathcal{H} \otimes \mathcal{L})$. El par $\mathcal{H} \otimes \mathcal{L}^+$ denotará la clase de todas las funciones medibles de $(H \times L, \mathcal{H} \otimes \mathcal{L})$ en $([0,\infty),\mathcal{B}[0,\infty))$.

Definición 37.1.17 *Sea θ_t el mapeo-shift conjunto de $H \times L$ en $H \times L$ dado por*

$$\theta_t\left(z,(s_k)_0^\infty\right) = \theta_t\left(z,\left(s_{n_{t-}+k} - t\right)_0^\infty\right)$$

donde $n_{t-} = inf\{n \ge 1 : s_n \ge t\}$.

Nota 37.1.14 *Con la finalidad de poder realizar los shift's sin complicaciones de medibilidad, se supondrá que Z es shit-medible, es decir, el conjunto de trayectorias H es invariante bajo shifts del tiempo y el mapeo que toma $(z,t) \in H \times [0,\infty)$ en $z_t \in E$ es $\mathcal{H} \otimes \mathcal{B}[0,\infty)/\mathcal{E}$ medible.*

Definición 37.1.18 *Dado un proceso **PEOSSM** (Proceso Estocástico One Side Shift Medible) Z, se dice regenerativo clásico con tiempos de regeneración S si*

$$\theta_{S_n}(Z,S) = \left(Z^0,S^0\right), n \ge 0$$

y además $\theta_{S_n}(Z,S)$ es independiente de $((Z_s)\, s \in [0,S_n), S_0,\ldots,S_n)$ Si lo anterior se cumple, al par (Z,S) se le llama regenerativo clásico.

Nota 37.1.15 *Si el par (Z,S) es regenerativo clásico, entonces las longitudes de los ciclos $X_1,X_2,\ldots,$ son i.i.d. e independientes de la longitud del retraso S_0, es decir, S es un proceso de renovación. Las longitudes de los ciclos también son llamados tiempos de inter-regeneración y tiempos de ocurrencia.*

Teorema 37.1.3 *Supóngase que el par (Z,S) es regenerativo clásico con $\mathbb{E}[X_1] < \infty$. Entonces (Z^*,S^*) en el teorema 2.1 es una versión estacionaria de (Z,S). Además, si X_1 es lattice con span d, entonces (Z^{**},S^{**}) en el teorema 2.2 es una versión periodicamente estacionaria de (Z,S) con periodo d.*

Definición 37.1.19 *Una variable aleatoria X_1 es spread out si existe una $n \ge 1$ y una función $f \in \mathcal{B}^+$ tal que $\int_{\mathbb{R}} f(x)\,dx > 0$ con $X_2,X_3,\ldots,X_n$ copias i.i.d de X_1,*

$$\mathbb{P}(X_1 + \cdots + X_n \in B) \ge \int_B f(x)\,dx$$

para $B \in \mathcal{B}$.

Definición 37.1.20 *Dado un proceso estocástico Z se le llama wide-sense regenerative (**WSR**) con tiempos de regeneración S si $\theta_{S_n}(Z,S) = \left(Z^0, S^0\right)$ para $n \geq 0$ en distribución y $\theta_{S_n}(Z,S)$ es independiente de $(S_0, S_1, \ldots, S_n)$ para $n \geq 0$. Se dice que el par (Z,S) es WSR si lo anterior se cumple.*

Nota 37.1.16
- *El proceso de trayectorias $(\theta_s Z)_{s\in[0,\infty)}$ es WSR con tiempos de regeneración S pero no es regenerativo clásico.*
- *Si Z es cualquier proceso estacionario y S es un proceso de renovación que es independiente de Z, entonces (Z,S) es WSR pero en general no es regenerativo clásico*

Nota 37.1.17 *Para cualquier proceso estocástico Z, el proceso de trayectorias $(\theta_s Z)_{s\in[0,\infty)}$ es siempre un proceso de Markov.*

Teorema 37.1.4 *Supongase que el par (Z,S) es WSR con $\mathbb{E}[X_1] < \infty$. Entonces (Z^*, S^*) en el teorema 2.1 es una versión estacionaria de (Z,S).*

Teorema 37.1.5 *Supongase que (Z,S) es cycle-stationary con $\mathbb{E}[X_1] < \infty$. Sea U distribuida uniformemente en $[0,1)$ e independiente de $\left(Z^0, S^0\right)$ y sea $\mathbb{P}^*$ la medida de probabilidad en $(\Omega, \mathbb{P})$ definida por*

$$d\mathbb{P}^* = \frac{X_1}{\mathbb{E}[X_1]} d\mathbb{P}$$

. Sea (Z^*, S^*) con distribución $\mathbb{P}^*\left(\theta_{UX_1}\left(Z^0, S^0\right) \in \cdot\right)$. Entonces $(Z*, S^*)$ es estacionario,

$$\mathbb{E}\left[f\left(Z^*, S^*\right)\right] = \mathbb{E}\left[\int_0^{X_1} f\left(\theta_s\left(Z^0, S^0\right)\right) ds\right] / \mathbb{E}[X_1]$$

$f \in \mathcal{H} \otimes \mathcal{L}^+$, and S_0^* es continuo con función distribución G_∞ definida por

$$G_\infty(x) := \frac{\mathbb{E}[X_1] \wedge x}{\mathbb{E}[X_1]}$$

para $x \geq 0$ y densidad $\mathbb{P}[X_1 > x] / \mathbb{E}[X_1]$, con $x \geq 0$.

Teorema 37.1.6 *Sea Z un Proceso Estocástico un lado shift-medible one-sided shift-measurable stochastic process, (PEOSSM), y S_0 y S_1 tiempos aleatorios tales que $0 \leq S_0 < S_1$ y*

$$\theta_{S_1} Z = \theta_{S_0} Z \text{ en distribución.} \tag{37.1.3}$$

Entonces el espacio de probabilidad subyacente $(\Omega, \mathcal{F}, \mathbb{P})$ puede extenderse para soportar una sucesión de tiempos aleatorios S tales que

$$\theta_{S_n}(Z,S) = \left(Z^0, S^0\right), n \geq 0, \text{ en distribución,} \tag{37.1.4}$$

$$(Z, S_0, S_1) \text{ depende de } (X_2, X_3, \ldots) \text{ solamente a traves de } \theta_{S_1} Z. \tag{37.1.5}$$

Definición 37.1.21 *Un elemento aleatorio en un espacio medible $(E, \mathcal{E})$ en un espacio de probabilidad $(\Omega, \mathcal{F}, \mathbb{P})$ a $(E, \mathcal{E})$, es decir, para $A \in \mathcal{E}$, se tiene que $\{Y \in A\} \in \mathcal{F}$, donde $\{Y \in A\} := \{w \in \Omega : Y(w) \in A\} =: Y^{-1}A$.*

Nota 37.1.18 *También se dice que Y está soportado por el espacio de probabilidad $(\Omega, \mathcal{F}, \mathbb{P})$ y que Y es un mapeo medible de Ω en E, es decir, es $\mathcal{F}/\mathcal{E}$ medible.*

Definición 37.1.22 *Para cada $i \in \mathbb{I}$ sea P_i una medida de probabilidad en un espacio medible $(E_i, \mathcal{E}_i)$. Se define el espacio producto $\otimes_{i\in\mathbb{I}}(E_i, \mathcal{E}_i) := \left(\prod_{i\in\mathbb{I}} E_i, \otimes_{i\in\mathbb{I}}\mathcal{E}_i\right)$, donde $\prod_{i\in\mathbb{I}} E_i$ es el producto cartesiano de los E_i's, y $\otimes_{i\in\mathbb{I}}\mathcal{E}_i$ es la σ-álgebra producto, es decir, es la σ-álgebra más pequeña en $\prod_{i\in\mathbb{I}} E_i$ que hace al i-ésimo mapeo proyección en E_i medible para toda $i \in \mathbb{I}$ es la σ-álgebra inducida por los mapeos proyección.*

$$\otimes_{i\in\mathbb{I}}\mathcal{E}_i := \sigma\left\{\{y : y_i \in A\} : i \in \mathbb{I} \text{ y } A \in \mathcal{E}_i\right\}.$$

Definición 37.1.23 *Un espacio de probabilidad $\left(\tilde{\Omega}, \tilde{\mathcal{F}}, \tilde{\mathbb{P}}\right)$ es una extensión de otro espacio de probabilidad $(\Omega, \mathcal{F}, \mathbb{P})$ si $\left(\tilde{\Omega}, \tilde{\mathcal{F}}, \tilde{\mathbb{P}}\right)$ soporta un elemento aleatorio $\xi \in (\Omega, \mathcal{F})$ que tienen a $\mathbb{P}$ como distribución.*

Teorema 37.1.7 *Sea $\mathbb{I}$ un conjunto de índices arbitrario. Para cada $i \in \mathbb{I}$ sea P_i una medida de probabilidad en un espacio medible $(E_i, \mathcal{E}_i)$. Entonces existe una única medida de probabilidad $\otimes_{i\in\mathbb{I}} P_i$ en $\otimes_{i\in\mathbb{I}}(E_i, \mathcal{E}_i)$ tal que*

$$\otimes_{i\in\mathbb{I}} P_i\left(y \in \prod_{i\in\mathbb{I}} E_i : y_i \in A_{i_1}, \ldots, y_n \in A_{i_n}\right) = P_{i_1}(A_{i_n}) \cdots P_{i_n}(A_{i_n})$$

para todos los enteros $n > 0$, toda $i_1, \ldots, i_n \in \mathbb{I}$ y todo $A_{i_1} \in \mathcal{E}_{i_1}, \ldots, A_{i_n} \in \mathcal{E}_{i_n}$

La medida $\otimes_{i\in\mathbb{I}}P_i$ es llamada la medida producto y $\otimes_{i\in\mathbb{I}}(E_i,\mathcal{E}_i,P_i) := \left(\prod_{i\in\mathbb{I}}, E_i, \otimes_{i\in\mathbb{I}}\mathcal{E}_i, \otimes_{i\in\mathbb{I}}P_i\right)$, es llamado espacio de probabilidad producto.

Definición 37.1.24 *Un espacio medible $(E,\mathcal{E})$ es Polaco si existe una métrica en E tal que E es completo, es decir cada sucesión de Cauchy converge a un límite en E, y separable, E tienen un subconjunto denso numerable, y tal que $\mathcal{E}$ es generado por conjuntos abiertos.*

Definición 37.1.25 *Dos espacios medibles $(E,\mathcal{E})$ y $(G,\mathcal{G})$ son Borel equivalentes isomorfos si existe una biyección $f : E \to G$ tal que f es $\mathcal{E}/\mathcal{G}$ medible y su inversa f^{-1} es $\mathcal{G}/\mathcal{E}$ medible. La biyección es una equivalencia de Borel.*

Definición 37.1.26 *Un espacio medible $(E,\mathcal{E})$ es un espacio estándar si es Borel equivalente a $(G,\mathcal{G})$, donde G es un subconjunto de Borel de $[0,1]$ y $\mathcal{G}$ son los subconjuntos de Borel de G.*

Nota 37.1.19 *Cualquier espacio Polaco es un espacio estándar.*

Definición 37.1.27 *Un proceso estocástico con conjunto de índices $\mathbb{I}$ y espacio de estados $(E,\mathcal{E})$ es una familia $Z = (\mathbb{Z}_s)_{s\in\mathbb{I}}$ donde $\mathbb{Z}_s$ son elementos aleatorios definidos en un espacio de probabilidad común $(\Omega,\mathcal{F},\mathbb{P})$ y todos toman valores en $(E,\mathcal{E})$.*

Definición 37.1.28 *Un proceso estocástico one-sided contiuous time (**PEOSCT**) es un proceso estocástico con conjunto de índices $\mathbb{I} = [0,\infty)$.*

Sea $\left(E^{\mathbb{I}},\mathcal{E}^{\mathbb{I}}\right)$ denota el espacio producto $\left(E^{\mathbb{I}},\mathcal{E}^{\mathbb{I}}\right) := \otimes_{s\in\mathbb{I}}(E,\mathcal{E})$. Vamos a considerar $\mathbb{Z}$ como un mapeo aleatorio, es decir, como un elemento aleatorio en $\left(E^{\mathbb{I}},\mathcal{E}^{\mathbb{I}}\right)$ definido por $Z(w) = (Z_s(w))_{s\in\mathbb{I}}$ y $w \in \Omega$.

Nota 37.1.20 *La distribución de un proceso estocástico Z es la distribución de Z como un elemento aleatorio en $\left(E^{\mathbb{I}},\mathcal{E}^{\mathbb{I}}\right)$. La distribución de Z esta determinada de manera única por las distribuciones finito dimensionales.*

Nota 37.1.21 *En particular cuando Z toma valores reales, es decir, $(E,\mathcal{E}) = (\mathbb{R},\mathcal{B})$ las distribuciones finito dimensionales están determinadas por las funciones de distribución finito dimensionales*

$$\mathbb{P}(Z_{t_1} \le x_1,\ldots,Z_{t_n} \le x_n), x_1,\ldots,x_n \in \mathbb{R}, t_1,\ldots,t_n \in \mathbb{I}, n \ge 1. \tag{37.1.6}$$

Nota 37.1.22 *Para espacios polacos $(E,\mathcal{E})$ el Teorema de Consistencia de Kolmogorov asegura que dada una colección de distribuciones finito dimensionales consistentes, siempre existe un proceso estocástico que posee tales distribuciones finito dimensionales.*

Definición 37.1.29 *Las trayectorias de Z son las realizaciones $Z(w)$ para $w \in \Omega$ del mapeo aleatorio Z.*

Nota 37.1.23 *Algunas restricciones se imponen sobre las trayectorias, por ejemplo que sean continuas por la derecha, o continuas por la derecha con límites por la izquierda, o de manera más general, se pedirá que caigan en algún subconjunto H de $E^{\mathbb{I}}$. En este caso es natural considerar a Z como un elemento aleatorio que no está en $\left(E^{\mathbb{I}},\mathcal{E}^{\mathbb{I}}\right)$ sino en $(H,\mathcal{H})$, donde $\mathcal{H}$ es la σ-álgebra generada por los mapeos proyección que toman a $z \in H$ a $z_t \in E$ para $t \in \mathbb{I}$. A $\mathcal{H}$ se le conoce como la traza de H en $E^{\mathbb{I}}$, es decir,*

$$\mathcal{H} := E^{\mathbb{I}} \cap H := \left\{A \cap H : A \in E^{\mathbb{I}}\right\}. \tag{37.1.7}$$

Nota 37.1.24 *Z tiene trayectorias con valores en H y cada Z_t es un mapeo medible de $(\Omega,\mathcal{F})$ a $(H,\mathcal{H})$. Cuando se considera un espacio de trayectorias en particular H, al espacio $(H,\mathcal{H})$ se le llama el espacio de trayectorias de Z.*

Nota 37.1.25 *La distribución del proceso estocástico Z con espacio de trayectorias $(H,\mathcal{H})$ es la distribución de Z como un elemento aleatorio en $(H,\mathcal{H})$. La distribución, nuevemente, está determinada de manera única por las distribuciones finito dimensionales.*

Definición 37.1.30 *Sea Z un PEOSCT con espacio de estados $(E,\mathcal{E})$ y sea T un tiempo aleatorio en $[0,\infty)$. Por Z_T se entiende el mapeo con valores en E definido en Ω en la manera obvia:*

$$Z_T(w) := Z_{T(w)}(w).w \in \Omega.$$

Definición 37.1.31 *Un PEOSCT Z es conjuntamente medible (**CM**) si el mapeo que toma $(w,t) \in \Omega \times [0,\infty)$ a $Z_t(w) \in E$ es $\mathcal{F} \otimes \mathcal{B}[0,\infty)/\mathcal{E}$ medible.*

Nota 37.1.26 *Un PEOSCT-CM implica que el proceso es medible, dado que Z_T es una composición de dos mapeos continuos: el primero que toma w en $(w, T(w))$ es $\mathcal{F}/\mathcal{F}\otimes\mathcal{B}[0,\infty)$ medible, mientras que el segundo toma $(w, T(w))$ en $Z_{T(w)}(w)$ es $\mathcal{F}\otimes\mathcal{B}[0,\infty)/\mathcal{E}$ medible.*

Definición 37.1.32 *Un PEOSCT con espacio de estados $(H, \mathcal{H})$ es canónicamente conjuntamente medible **(CCM)** si el mapeo $(z,t) \in H \times [0,\infty)$ en $Z_t \in E$ es $\mathcal{H}\otimes\mathcal{B}[0,\infty)/\mathcal{E}$ medible.*

Nota 37.1.27 *Un PEOSCTCCM implica que el proceso es CM, dado que un PECCM Z es un mapeo de $\Omega\times[0,\infty)$ a E, es la composición de dos mapeos medibles: el primero, toma (w,t) en $(Z(w), t)$ es $\mathcal{F}\otimes\mathcal{B}[0,\infty)/\mathcal{H}\otimes\mathcal{B}[0,\infty)$ medible, y el segundo que toma $(Z(w), t)$ en $Z_t(w)$ es $\mathcal{H}\otimes\mathcal{B}[0,\infty)/\mathcal{E}$ medible. Por tanto CCM es una condición más fuerte que CM.*

Definición 37.1.33 *Un conjunto de trayectorias H de un PEOSCT Z, es internamente shift-invariante **(ISI)** si*

$$\left\{(z_{t+s})_{s\in[0,\infty)} : z \in H\right\} = H,\ t \in [0,\infty).$$

Definición 37.1.34 *Dado un PEOSCTISI, se define el mapeo-shift θ_t, $t \in [0,\infty)$, de H a H por*

$$\theta_t z = (z_{t+s})_{s\in[0,\infty)},\ z \in H.$$

Definición 37.1.35 *Se dice que un proceso Z es shift-medible **(SM)** si Z tiene un conjunto de trayectorias H que es ISI y además el mapeo que toma $(z,t) \in H\times[0,\infty)$ en $\theta_t z \in H$ es $\mathcal{H}\otimes\mathcal{B}[0,\infty)/\mathcal{H}$ medible.*

Nota 37.1.28 *Un proceso estocástico con conjunto de trayectorias H ISI es shift-medible si y sólo si es CCM*

Nota 37.1.29
- *Dado el espacio polaco $(E, \mathcal{E})$ se tiene el conjunto de trayectorias $D_E[0,\infty)$ que es ISI, entonces cumpe con ser CCM.*
- *Si G es abierto, podemos cubrirlo por bolas abiertas cuay cerradura este contenida en G, y como G es segundo numerable como subespacio de E, lo podemos cubrir por una cantidad numerable de bolas abiertas.*

Nota 37.1.30 *Los procesos estocásticos Z a tiempo discreto con espacio de estados polaco, también tiene un espacio de trayectorias polaco y por tanto tiene distribuciones condicionales regulares.*

Teorema 37.1.8 *El producto numerable de espacios polacos es polaco.*

Definición 37.1.36 *Sea $(\Omega, \mathcal{F}, \mathbb{P})$ espacio de probabilidad que soporta al proceso $Z = (Z_s)_{s\in[0,\infty)}$ y $S = (S_k)_0^\infty$ donde Z es un PEOSCTM con espacio de estados $(E, \mathcal{E})$ y espacio de trayectorias $(H, \mathcal{H})$ y además S es una sucesión de tiempos aleatorios one-sided que satisfacen la condición $0 \le S_0 < S_1 < \cdots \to \infty$. Considerando S como un mapeo medible de $(\Omega, \mathcal{F})$ al espacio sucesión $(L, \mathcal{L})$, donde*

$$L = \left\{(s_k)_0^\infty \in [0,\infty)^{\{0,1,\ldots\}} : s_0 < s_1 < \cdots \to \infty\right\},$$

donde $\mathcal{L}$ son los subconjuntos de Borel de L, es decir, $\mathcal{L} = L \cap \mathcal{B}^{\{0,1,\ldots\}}$.

Así el par (Z, S) es un mapeo medible de $(\Omega, \mathcal{F})$ en $(H\times L, \mathcal{H}\otimes\mathcal{L})$. El par $\mathcal{H}\otimes\mathcal{L}^+$ denotará la clase de todas las funciones medibles de $(H\times L, \mathcal{H}\otimes\mathcal{L})$ en $([0,\infty), \mathcal{B}[0,\infty))$.

Definición 37.1.37 *Sea θ_t el mapeo-shift conjunto de $H\times L$ en $H\times L$ dado por*

$$\theta_t\left(z, (s_k)_0^\infty\right) = \theta_t\left(z, \left(s_{n_{t-}+k} - t\right)_0^\infty\right)$$

donde $n_{t-} = inf\{n \ge 1 : s_n \ge t\}$.

Nota 37.1.31 *Con la finalidad de poder realizar los shift's sin complicaciones de medibilidad, se supondrá que Z es shit-medible, es decir, el conjunto de trayectorias H es invariante bajo shifts del tiempo y el mapeo que toma $(z,t) \in H\times[0,\infty)$ en $z_t \in E$ es $\mathcal{H}\otimes\mathcal{B}[0,\infty)/\mathcal{E}$ medible.*

Definición 37.1.38 *Dado un proceso **PEOSSM** (Proceso Estocástico One Side Shift Medible) Z, se dice regenerativo clásico con tiempos de regeneración S si*

$$\theta_{S_n}(Z, S) = \left(Z^0, S^0\right), n \ge 0$$

y además $\theta_{S_n}(Z, S)$ es independiente de $((Z_s)\, s \in [0, S_n), S_0, \ldots, S_n)$ Si lo anterior se cumple, al par (Z, S) se le llama regenerativo clásico.

Nota 37.1.32 *Si el par (Z,S) es regenerativo clásico, entonces las longitudes de los ciclos $X_1, X_2, \ldots,$ son i.i.d. e independientes de la longitud del retraso S_0, es decir, S es un proceso de renovación. Las longitudes de los ciclos también son llamados tiempos de inter-regeneración y tiempos de ocurrencia.*

Teorema 37.1.9 *Supóngase que el par (Z,S) es regenerativo clásico con $\mathbb{E}[X_1] < \infty$. Entonces (Z^*, S^*) en el teorema 2.1 es una versión estacionaria de (Z,S). Además, si X_1 es lattice con span d, entonces (Z^{**}, S^{**}) en el teorema 2.2 es una versión periodicamente estacionaria de (Z,S) con periodo d.*

Definición 37.1.39 *Una variable aleatoria X_1 es spread out si existe una $n \geq 1$ y una función $f \in \mathcal{B}^+$ tal que $\int_{\mathbb{R}} f(x)\,dx > 0$ con $X_2, X_3, \ldots, X_n$ copias i.i.d de X_1,*

$$\mathbb{P}(X_1 + \cdots + X_n \in B) \geq \int_B f(x)\,dx$$

para $B \in \mathcal{B}$.

Definición 37.1.40 *Dado un proceso estocástico Z se le llama wide-sense regenerative (**WSR**) con tiempos de regeneración S si $\theta_{S_n}(Z,S) = \left(Z^0, S^0\right)$ para $n \geq 0$ en distribución y $\theta_{S_n}(Z,S)$ es independiente de $(S_0, S_1, \ldots, S_n)$ para $n \geq 0$. Se dice que el par (Z,S) es WSR si lo anterior se cumple.*

Nota 37.1.33
- *El proceso de trayectorias $(\theta_s Z)_{s\in[0,\infty)}$ es WSR con tiempos de regeneración S pero no es regenerativo clásico.*
- *Si Z es cualquier proceso estacionario y S es un proceso de renovación que es independiente de Z, entonces (Z,S) es WSR pero en general no es regenerativo clásico*

Nota 37.1.34 *Para cualquier proceso estocástico Z, el proceso de trayectorias $(\theta_s Z)_{s\in[0,\infty)}$ es siempre un proceso de Markov.*

Teorema 37.1.10 *Supongase que el par (Z,S) es WSR con $\mathbb{E}[X_1] < \infty$. Entonces (Z^*, S^*) en el teorema 2.1 es una versión estacionaria de (Z,S).*

Teorema 37.1.11 *Supongase que (Z,S) es cycle-stationary con $\mathbb{E}[X_1] < \infty$. Sea U distribuida uniformemente en $[0,1)$ e independiente de $\left(Z^0, S^0\right)$ y sea $\mathbb{P}^*$ la medida de probabilidad en $(\Omega, \mathbb{P})$ definida por*

$$d\mathbb{P}^* = \frac{X_1}{\mathbb{E}[X_1]} d\mathbb{P}$$

. Sea (Z^*, S^*) con distribución $\mathbb{P}^*\left(\theta_{UX_1}\left(Z^0, S^0\right) \in \cdot\right)$. Entonces $(Z*, S^*)$ es estacionario,

$$\mathbb{E}[f(Z^*, S^*)] = \mathbb{E}\left[\int_0^{X_1} f\left(\theta_s\left(Z^0, S^0\right)\right) ds\right] / \mathbb{E}[X_1]$$

$f \in \mathcal{H} \otimes \mathcal{L}^+$, and S_0^* es continuo con función distribución G_∞ definida por

$$G_\infty(x) := \frac{\mathbb{E}[X_1] \wedge x}{\mathbb{E}[X_1]}$$

para $x \geq 0$ y densidad $\mathbb{P}[X_1 > x] / \mathbb{E}[X_1]$, con $x \geq 0$.

Teorema 37.1.12 *Sea Z un Proceso Estocástico un lado shift-medible one-sided shift-measurable stochastic process, (PEOSSM), y S_0 y S_1 tiempos aleatorios tales que $0 \leq S_0 < S_1$ y*

$$\theta_{S_1} Z = \theta_{S_0} Z \text{ en distribución.} \tag{37.1.8}$$

Entonces el espacio de probabilidad subyacente $(\Omega, \mathcal{F}, \mathbb{P})$ puede extenderse para soportar una sucesión de tiempos aleatorios S tales que

$$\theta_{S_n}(Z,S) = \left(Z^0, S^0\right), n \geq 0, \text{ en distribución,} \tag{37.1.9}$$

$$(Z, S_0, S_1) \text{ depende de } (X_2, X_3, \ldots) \text{ solamente a traves de } \theta_{S_1} Z. \tag{37.1.10}$$

Definición 37.1.41 *Un elemento aleatorio en un espacio medible $(E, \mathcal{E})$ en un espacio de probabilidad $(\Omega, \mathcal{F}, \mathbb{P})$ a $(E, \mathcal{E})$, es decir, para $A \in \mathcal{E}$, se tiene que $\{Y \in A\} \in \mathcal{F}$, donde $\{Y \in A\} := \{w \in \Omega : Y(w) \in A\} =: Y^{-1}A$.*

Nota 37.1.35 *También se dice que Y está soportado por el espacio de probabilidad $(\Omega, \mathcal{F}, \mathbb{P})$ y que Y es un mapeo medible de Ω en E, es decir, es $\mathcal{F}/\mathcal{E}$ medible.*

Definición 37.1.42 *Para cada $i \in \mathbb{I}$ sea P_i una medida de probabilidad en un espacio medible $(E_i, \mathcal{E}_i)$. Se define el espacio producto $\otimes_{i\in\mathbb{I}}(E_i, \mathcal{E}_i) := \left(\prod_{i\in\mathbb{I}} E_i, \otimes_{i\in\mathbb{I}}\mathcal{E}_i\right)$, donde $\prod_{i\in\mathbb{I}} E_i$ es el producto cartesiano de los E_i's, y $\otimes_{i\in\mathbb{I}}\mathcal{E}_i$ es la σ-álgebra producto, es decir, es la σ-álgebra más pequeña en $\prod_{i\in\mathbb{I}} E_i$ que hace al i-ésimo mapeo proyección en E_i medible para toda $i \in \mathbb{I}$ es la σ-álgebra inducida por los mapeos proyección.*

$$\otimes_{i\in\mathbb{I}}\mathcal{E}_i := \sigma\left\{\{y : y_i \in A\} : i \in \mathbb{I} \text{ y } A \in \mathcal{E}_i\right\}.$$

Definición 37.1.43 *Un espacio de probabilidad $\left(\tilde{\Omega}, \tilde{\mathcal{F}}, \tilde{\mathbb{P}}\right)$ es una extensión de otro espacio de probabilidad $(\Omega, \mathcal{F}, \mathbb{P})$ si $\left(\tilde{\Omega}, \tilde{\mathcal{F}}, \tilde{\mathbb{P}}\right)$ soporta un elemento aleatorio $\xi \in (\Omega, \mathcal{F})$ que tienen a $\mathbb{P}$ como distribución.*

Teorema 37.1.13 *Sea $\mathbb{I}$ un conjunto de índices arbitrario. Para cada $i \in \mathbb{I}$ sea P_i una medida de probabilidad en un espacio medible $(E_i, \mathcal{E}_i)$. Entonces existe una única medida de probabilidad $\otimes_{i\in\mathbb{I}}P_i$ en $\otimes_{i\in\mathbb{I}}(E_i, \mathcal{E}_i)$ tal que*

$$\otimes_{i\in\mathbb{I}}P_i\left(y \in \prod_{i\in\mathbb{I}} E_i : y_i \in A_{i_1}, \ldots, y_n \in A_{i_n}\right) = P_{i_1}(A_{i_n}) \cdots P_{i_n}(A_{i_n})$$

para todos los enteros $n > 0$, toda $i_1, \ldots, i_n \in \mathbb{I}$ y todo $A_{i_1} \in \mathcal{E}_{i_1}, \ldots, A_{i_n} \in \mathcal{E}_{i_n}$

La medida $\otimes_{i\in\mathbb{I}}P_i$ es llamada la medida producto y $\otimes_{i\in\mathbb{I}}(E_i, \mathcal{E}_i, P_i) := \left(\prod_{i\in\mathbb{I}}, E_i, \otimes_{i\in\mathbb{I}}\mathcal{E}_i, \otimes_{i\in\mathbb{I}}P_i\right)$, es llamado espacio de probabilidad producto.

Definición 37.1.44 *Un espacio medible $(E, \mathcal{E})$ es Polaco si existe una métrica en E tal que E es completo, es decir cada sucesión de Cauchy converge a un límite en E, y separable, E tienen un subconjunto denso numerable, y tal que $\mathcal{E}$ es generado por conjuntos abiertos.*

Definición 37.1.45 *Dos espacios medibles $(E, \mathcal{E})$ y $(G, \mathcal{G})$ son Borel equivalentes isomorfos si existe una biyección $f : E \to G$ tal que f es $\mathcal{E}/\mathcal{G}$ medible y su inversa f^{-1} es $\mathcal{G}/\mathcal{E}$ medible. La biyección es una equivalencia de Borel.*

Definición 37.1.46 *Un espacio medible $(E, \mathcal{E})$ es un espacio estándar si es Borel equivalente a $(G, \mathcal{G})$, donde G es un subconjunto de Borel de $[0, 1]$ y $\mathcal{G}$ son los subconjuntos de Borel de G.*

Nota 37.1.36 *Cualquier espacio Polaco es un espacio estándar.*

Definición 37.1.47 *Un proceso estocástico con conjunto de índices $\mathbb{I}$ y espacio de estados $(E, \mathcal{E})$ es una familia $Z = (\mathbb{Z}_s)_{s\in\mathbb{I}}$ donde $\mathbb{Z}_s$ son elementos aleatorios definidos en un espacio de probabilidad común $(\Omega, \mathcal{F}, \mathbb{P})$ y todos toman valores en $(E, \mathcal{E})$.*

Definición 37.1.48 *Un proceso estocástico one-sided contiuous time (**PEOSCT**) es un proceso estocástico con conjunto de índices $\mathbb{I} = [0, \infty)$.*

Sea $\left(E^{\mathbb{I}}, \mathcal{E}^{\mathbb{I}}\right)$ denota el espacio producto $\left(E^{\mathbb{I}}, \mathcal{E}^{\mathbb{I}}\right) := \otimes_{s\in\mathbb{I}}(E, \mathcal{E})$. Vamos a considerar $\mathbb{Z}$ como un mapeo aleatorio, es decir, como un elemento aleatorio en $\left(E^{\mathbb{I}}, \mathcal{E}^{\mathbb{I}}\right)$ definido por $Z(w) = (Z_s(w))_{s\in\mathbb{I}}$ y $w \in \Omega$.

Nota 37.1.37 *La distribución de un proceso estocástico Z es la distribución de Z como un elemento aleatorio en $\left(E^{\mathbb{I}}, \mathcal{E}^{\mathbb{I}}\right)$. La distribución de Z esta determinada de manera única por las distribuciones finito dimensionales.*

Nota 37.1.38 *En particular cuando Z toma valores reales, es decir, $(E, \mathcal{E}) = (\mathbb{R}, \mathcal{B})$ las distribuciones finito dimensionales están determinadas por las funciones de distribución finito dimensionales*

$$\mathbb{P}(Z_{t_1} \leq x_1, \ldots, Z_{t_n} \leq x_n), x_1, \ldots, x_n \in \mathbb{R}, t_1, \ldots, t_n \in \mathbb{I}, n \geq 1. \tag{37.1.11}$$

Nota 37.1.39 *Para espacios polacos $(E, \mathcal{E})$ el Teorema de Consistencia de Kolmogorov asegura que dada una colección de distribuciones finito dimensionales consistentes, siempre existe un proceso estocástico que posee tales distribuciones finito dimensionales.*

Definición 37.1.49 *Las trayectorias de Z son las realizaciones $Z(w)$ para $w \in \Omega$ del mapeo aleatorio Z.*

Nota 37.1.40 *Algunas restricciones se imponen sobre las trayectorias, por ejemplo que sean continuas por la derecha, o continuas por la derecha con límites por la izquierda, o de manera más general, se pedirá que caigan en algún subconjunto H de $E^{\mathbb{I}}$. En este caso es natural considerar a Z como un elemento aleatorio que no está en $\left(E^{\mathbb{I}}, \mathcal{E}^{\mathbb{I}}\right)$ sino en $(H, \mathcal{H})$, donde $\mathcal{H}$ es la σ-álgebra generada por los mapeos proyección que toman a $z \in H$ a $z_t \in E$ para $t \in \mathbb{I}$. A $\mathcal{H}$ se le conoce como la traza de H en $E^{\mathbb{I}}$, es decir,*

$$\mathcal{H} := E^{\mathbb{I}} \cap H := \left\{A \cap H : A \in E^{\mathbb{I}}\right\}. \tag{37.1.12}$$

Nota 37.1.41 *Z tiene trayectorias con valores en H y cada Z_t es un mapeo medible de $(\Omega, \mathcal{F})$ a $(H, \mathcal{H})$. Cuando se considera un espacio de trayectorias en particular H, al espacio $(H, \mathcal{H})$ se le llama el espacio de trayectorias de Z.*

Nota 37.1.42 *La distribución del proceso estocástico Z con espacio de trayectorias $(H, \mathcal{H})$ es la distribución de Z como un elemento aleatorio en $(H, \mathcal{H})$. La distribución, nuevemente, está determinada de manera única por las distribuciones finito dimensionales.*

Definición 37.1.50 *Sea Z un PEOSCT con espacio de estados $(E, \mathcal{E})$ y sea T un tiempo aleatorio en $[0, \infty)$. Por Z_T se entiende el mapeo con valores en E definido en Ω en la manera obvia:*

$$Z_T(w) := Z_{T(w)}(w) . w \in \Omega.$$

Definición 37.1.51 *Un PEOSCT Z es conjuntamente medible (**CM**) si el mapeo que toma $(w, t) \in \Omega \times [0, \infty)$ a $Z_t(w) \in E$ es $\mathcal{F} \otimes \mathcal{B}[0, \infty) / \mathcal{E}$ medible.*

Nota 37.1.43 *Un PEOSCT-CM implica que el proceso es medible, dado que Z_T es una composición de dos mapeos continuos: el primero que toma w en $(w, T(w))$ es $\mathcal{F}/\mathcal{F} \otimes \mathcal{B}[0, \infty)$ medible, mientras que el segundo toma $(w, T(w))$ en $Z_{T(w)}(w)$ es $\mathcal{F} \otimes \mathcal{B}[0, \infty) / \mathcal{E}$ medible.*

Definición 37.1.52 *Un PEOSCT con espacio de estados $(H, \mathcal{H})$ es canónicamente conjuntamente medible (**CCM**) si el mapeo $(z, t) \in H \times [0, \infty)$ en $Z_t \in E$ es $\mathcal{H} \otimes \mathcal{B}[0, \infty) / \mathcal{E}$ medible.*

Nota 37.1.44 *Un PEOSCTCCM implica que el proceso es CM, dado que un PECCM Z es un mapeo de $\Omega \times [0, \infty)$ a E, es la composición de dos mapeos medibles: el primero, toma (w, t) en $(Z(w), t)$ es $\mathcal{F} \otimes \mathcal{B}[0, \infty) / \mathcal{H} \otimes \mathcal{B}[0, \infty)$ medible, y el segundo que toma $(Z(w), t)$ en $Z_t(w)$ es $\mathcal{H} \otimes \mathcal{B}[0, \infty) / \mathcal{E}$ medible. Por tanto CCM es una condición más fuerte que CM.*

Definición 37.1.53 *Un conjunto de trayectorias H de un PEOSCT Z, es internamente shift-invariante (**ISI**) si*

$$\left\{ (z_{t+s})_{s \in [0, \infty)} : z \in H \right\} = H, \ t \in [0, \infty).$$

Definición 37.1.54 *Dado un PEOSCTISI, se define el mapeo-shift θ_t, $t \in [0, \infty)$, de H a H por*

$$\theta_t z = (z_{t+s})_{s \in [0, \infty)}, \ z \in H.$$

Definición 37.1.55 *Se dice que un proceso Z es shift-medible (**SM**) si Z tiene un conjunto de trayectorias H que es ISI y además el mapeo que toma $(z, t) \in H \times [0, \infty)$ en $\theta_t z \in H$ es $\mathcal{H} \otimes \mathcal{B}[0, \infty) / \mathcal{H}$ medible.*

Nota 37.1.45 *Un proceso estocástico con conjunto de trayectorias H ISI es shift-medible si y sólo si es CCM*

Nota 37.1.46
- *Dado el espacio polaco $(E, \mathcal{E})$ se tiene el conjunto de trayectorias $D_E[0, \infty)$ que es ISI, entonces cumpe con ser CCM.*
- *Si G es abierto, podemos cubrirlo por bolas abiertas cuay cerradura este contenida en G, y como G es segundo numerable como subespacio de E, lo podemos cubrir por una cantidad numerable de bolas abiertas.*

Nota 37.1.47 *Los procesos estocásticos Z a tiempo discreto con espacio de estados polaco, también tiene un espacio de trayectorias polaco y por tanto tiene distribuciones condicionales regulares.*

Teorema 37.1.14 *El producto numerable de espacios polacos es polaco.*

Definición 37.1.56 *Sea $(\Omega, \mathcal{F}, \mathbb{P})$ espacio de probabilidad que soporta al proceso $Z = (Z_s)_{s \in [0, \infty)}$ y $S = (S_k)_0^\infty$ donde Z es un PEOSCTM con espacio de estados $(E, \mathcal{E})$ y espacio de trayectorias $(H, \mathcal{H})$ y además S es una sucesión de tiempos aleatorios one-sided que satisfacen la condición $0 \leq S_0 < S_1 < \cdots \to \infty$. Considerando S como un mapeo medible de $(\Omega, \mathcal{F})$ al espacio sucesión $(L, \mathcal{L})$, donde*

$$L = \left\{ (s_k)_0^\infty \in [0, \infty)^{\{0,1,\ldots\}} : s_0 < s_1 < \cdots \to \infty \right\},$$

donde $\mathcal{L}$ son los subconjuntos de Borel de L, es decir, $\mathcal{L} = L \cap \mathcal{B}^{\{0,1,\ldots\}}$.

Así el par (Z, S) es un mapeo medible de $(\Omega, \mathcal{F})$ en $(H \times L, \mathcal{H} \otimes \mathcal{L})$. El par $\mathcal{H} \otimes \mathcal{L}^+$ denotará la clase de todas las funciones medibles de $(H \times L, \mathcal{H} \otimes \mathcal{L})$ en $([0, \infty), \mathcal{B}[0, \infty))$.

Definición 37.1.57 *Sea θ_t el mapeo-shift conjunto de $H \times L$ en $H \times L$ dado por*

$$\theta_t \left(z, (s_k)_0^\infty \right) = \theta_t \left(z, \left(s_{n_{t-}+k} - t \right)_0^\infty \right)$$

donde $n_{t-} = inf \{ n \geq 1 : s_n \geq t \}$.

Nota 37.1.48 *Con la finalidad de poder realizar los shift's sin complicaciones de medibilidad, se supondrá que Z es shit-medible, es decir, el conjunto de trayectorias H es invariante bajo shifts del tiempo y el mapeo que toma $(z,t) \in H \times [0,\infty)$ en $z_t \in E$ es $\mathcal{H} \otimes \mathcal{B}[0,\infty)/\mathcal{E}$ medible.*

Definición 37.1.58 *Dado un proceso **PEOSSM** (Proceso Estocástico One Side Shift Medible) Z, se dice regenerativo clásico con tiempos de regeneración S si*

$$\theta_{S_n}(Z,S) = \left(Z^0, S^0\right), n \geq 0$$

y además $\theta_{S_n}(Z,S)$ es independiente de $((Z_s)\, s \in [0,S_n), S_0, \ldots, S_n)$ Si lo anterior se cumple, al par (Z,S) se le llama regenerativo clásico.

Nota 37.1.49 *Si el par (Z,S) es regenerativo clásico, entonces las longitudes de los ciclos $X_1, X_2, \ldots,$ son i.i.d. e independientes de la longitud del retraso S_0, es decir, S es un proceso de renovación. Las longitudes de los ciclos también son llamados tiempos de inter-regeneración y tiempos de ocurrencia.*

Teorema 37.1.15 *Supóngase que el par (Z,S) es regenerativo clásico con $\mathbb{E}[X_1] < \infty$. Entonces (Z^*, S^*) en el teorema 2.1 es una versión estacionaria de (Z,S). Además, si X_1 es lattice con span d, entonces (Z^{**}, S^{**}) en el teorema 2.2 es una versión periodicamente estacionaria de (Z,S) con periodo d.*

Definición 37.1.59 *Una variable aleatoria X_1 es spread out si existe una $n \geq 1$ y una función $f \in \mathcal{B}^+$ tal que $\int_{\mathbb{R}} f(x)\,dx > 0$ con $X_2, X_3, \ldots, X_n$ copias i.i.d de X_1,*

$$\mathbb{P}(X_1 + \cdots + X_n \in B) \geq \int_B f(x)\,dx$$

para $B \in \mathcal{B}$.

Definición 37.1.60 *Dado un proceso estocástico Z se le llama wide-sense regenerative (**WSR**) con tiempos de regeneración S si $\theta_{S_n}(Z,S) = \left(Z^0, S^0\right)$ para $n \geq 0$ en distribución y $\theta_{S_n}(Z,S)$ es independiente de $(S_0, S_1, \ldots, S_n)$ para $n \geq 0$. Se dice que el par (Z,S) es WSR si lo anterior se cumple.*

Nota 37.1.50
- *El proceso de trayectorias $(\theta_s Z)_{s\in[0,\infty)}$ es WSR con tiempos de regeneración S pero no es regenerativo clásico.*
- *Si Z es cualquier proceso estacionario y S es un proceso de renovación que es independiente de Z, entonces (Z,S) es WSR pero en general no es regenerativo clásico*

Nota 37.1.51 *Para cualquier proceso estocástico Z, el proceso de trayectorias $(\theta_s Z)_{s\in[0,\infty)}$ es siempre un proceso de Markov.*

Teorema 37.1.16 *Supongase que el par (Z,S) es WSR con $\mathbb{E}[X_1] < \infty$. Entonces (Z^*, S^*) en el teorema 2.1 es una versión estacionaria de (Z,S).*

Teorema 37.1.17 *Supongase que (Z,S) es cycle-stationary con $\mathbb{E}[X_1] < \infty$. Sea U distribuida uniformemente en $[0,1)$ e independiente de $\left(Z^0, S^0\right)$ y sea $\mathbb{P}^*$ la medida de probabilidad en $(\Omega, \mathbb{P})$ definida por*

$$d\mathbb{P}^* = \frac{X_1}{\mathbb{E}[X_1]} d\mathbb{P}$$

. Sea (Z^*, S^*) con distribución $\mathbb{P}^*\left(\theta_{UX_1}\left(Z^0, S^0\right) \in \cdot\right)$. Entonces $(Z*, S^*)$ es estacionario,

$$\mathbb{E}[f(Z^*, S^*)] = \mathbb{E}\left[\int_0^{X_1} f\left(\theta_s\left(Z^0, S^0\right)\right) ds\right] / \mathbb{E}[X_1]$$

$f \in \mathcal{H} \otimes \mathcal{L}^+$, and S_0^* es continuo con función distribución G_∞ definida por

$$G_\infty(x) := \frac{\mathbb{E}[X_1] \wedge x}{\mathbb{E}[X_1]}$$

para $x \geq 0$ y densidad $\mathbb{P}[X_1 > x]/\mathbb{E}[X_1]$, con $x \geq 0$.

Teorema 37.1.18 *Sea Z un Proceso Estocástico un lado shift-medible one-sided shift-measurable stochastic process, (PEOSSM), y S_0 y S_1 tiempos aleatorios tales que $0 \leq S_0 < S_1$ y*

$$\theta_{S_1} Z = \theta_{S_0} Z \text{ en distribución.} \tag{37.1.13}$$

Entonces el espacio de probabilidad subyacente $(\Omega, \mathcal{F}, \mathbb{P})$ puede extenderse para soportar una sucesión de tiempos aleatorios S tales que

$$\theta_{S_n}(Z,S) = \left(Z^0, S^0\right), n \geq 0, \text{ en distribución,} \tag{37.1.14}$$

$$(Z, S_0, S_1) \text{ depende de } (X_2, X_3, \ldots) \text{ solamente a traves de } \theta_{S_1} Z. \tag{37.1.15}$$

Definición 37.1.61 *Un elemento aleatorio en un espacio medible $(E,\mathcal{E})$ en un espacio de probabilidad $(\Omega,\mathcal{F},\mathbb{P})$ a $(E,\mathcal{E})$, es decir, para $A\in\mathcal{E}$, se tiene que $\{Y\in A\}\in\mathcal{F}$, donde $\{Y\in A\}:=\{w\in\Omega:Y(w)\in A\}=:Y^{-1}A$.*

Nota 37.1.52 *También se dice que Y está soportado por el espacio de probabilidad $(\Omega,\mathcal{F},\mathbb{P})$ y que Y es un mapeo medible de Ω en E, es decir, es $\mathcal{F}/\mathcal{E}$ medible.*

Definición 37.1.62 *Para cada $i\in\mathbb{I}$ sea P_i una medida de probabilidad en un espacio medible $(E_i,\mathcal{E}_i)$. Se define el espacio producto $\otimes_{i\in\mathbb{I}}(E_i,\mathcal{E}_i):=\left(\prod_{i\in\mathbb{I}}E_i,\otimes_{i\in\mathbb{I}}\mathcal{E}_i\right)$, donde $\prod_{i\in\mathbb{I}}E_i$ es el producto cartesiano de los E_i's, y $\otimes_{i\in\mathbb{I}}\mathcal{E}_i$ es la σ-álgebra producto, es decir, es la σ-álgebra más pequeña en $\prod_{i\in\mathbb{I}}E_i$ que hace al i-ésimo mapeo proyección en E_i medible para toda $i\in\mathbb{I}$ es la σ-álgebra inducida por los mapeos proyección.*

$$\otimes_{i\in\mathbb{I}}\mathcal{E}_i:=\sigma\left\{\{y:y_i\in A\}:i\in\mathbb{I}\ y\ A\in\mathcal{E}_i\right\}.$$

Definición 37.1.63 *Un espacio de probabilidad $\left(\tilde{\Omega},\tilde{\mathcal{F}},\tilde{\mathbb{P}}\right)$ es una extensión de otro espacio de probabilidad $(\Omega,\mathcal{F},\mathbb{P})$ si $\left(\tilde{\Omega},\tilde{\mathcal{F}},\tilde{\mathbb{P}}\right)$ soporta un elemento aleatorio $\xi\in(\Omega,\mathcal{F})$ que tienen a $\mathbb{P}$ como distribución.*

Teorema 37.1.19 *Sea $\mathbb{I}$ un conjunto de índices arbitrario. Para cada $i\in\mathbb{I}$ sea P_i una medida de probabilidad en un espacio medible $(E_i,\mathcal{E}_i)$. Entonces existe una única medida de probabilidad $\otimes_{i\in\mathbb{I}}P_i$ en $\otimes_{i\in\mathbb{I}}(E_i,\mathcal{E}_i)$ tal que*

$$\otimes_{i\in\mathbb{I}}P_i\left(y\in\prod_{i\in\mathbb{I}}E_i:y_i\in A_{i_1},\ldots,y_n\in A_{i_n}\right)=P_{i_1}(A_{i_n})\cdots P_{i_n}(A_{i_n})$$

para todos los enteros $n>0$, toda $i_1,\ldots,i_n\in\mathbb{I}$ y todo $A_{i_1}\in\mathcal{E}_{i_1},\ldots,A_{i_n}\in\mathcal{E}_{i_n}$

La medida $\otimes_{i\in\mathbb{I}}P_i$ es llamada la medida producto y $\otimes_{i\in\mathbb{I}}(E_i,\mathcal{E}_i,P_i):=\left(\prod_{i\in\mathbb{I}},E_i,\otimes_{i\in\mathbb{I}}\mathcal{E}_i,\otimes_{i\in\mathbb{I}}P_i\right)$, es llamado espacio de probabilidad producto.

Definición 37.1.64 *Un espacio medible $(E,\mathcal{E})$ es Polaco si existe una métrica en E tal que E es completo, es decir cada sucesión de Cauchy converge a un límite en E, y separable, E tienen un subconjunto denso numerable, y tal que $\mathcal{E}$ es generado por conjuntos abiertos.*

Definición 37.1.65 *Dos espacios medibles $(E,\mathcal{E})$ y $(G,\mathcal{G})$ son Borel equivalentes isomorfos si existe una biyección $f:E\to G$ tal que f es $\mathcal{E}/\mathcal{G}$ medible y su inversa f^{-1} es $\mathcal{G}/\mathcal{E}$ medible. La biyección es una equivalencia de Borel.*

Definición 37.1.66 *Un espacio medible $(E,\mathcal{E})$ es un espacio estándar si es Borel equivalente a $(G,\mathcal{G})$, donde G es un subconjunto de Borel de $[0,1]$ y $\mathcal{G}$ son los subconjuntos de Borel de G.*

Nota 37.1.53 *Cualquier espacio Polaco es un espacio estándar.*

Definición 37.1.67 *Un proceso estocástico con conjunto de índices $\mathbb{I}$ y espacio de estados $(E,\mathcal{E})$ es una familia $Z=(\mathbb{Z}_s)_{s\in\mathbb{I}}$ donde $\mathbb{Z}_s$ son elementos aleatorios definidos en un espacio de probabilidad común $(\Omega,\mathcal{F},\mathbb{P})$ y todos toman valores en $(E,\mathcal{E})$.*

Definición 37.1.68 *Un proceso estocástico one-sided contiuous time (**PEOSCT**) es un proceso estocástico con conjunto de índices $\mathbb{I}=[0,\infty)$.*

Sea $\left(E^{\mathbb{I}},\mathcal{E}^{\mathbb{I}}\right)$ denota el espacio producto $\left(E^{\mathbb{I}},\mathcal{E}^{\mathbb{I}}\right):=\otimes_{s\in\mathbb{I}}(E,\mathcal{E})$. Vamos a considerar $\mathbb{Z}$ como un mapeo aleatorio, es decir, como un elemento aleatorio en $\left(E^{\mathbb{I}},\mathcal{E}^{\mathbb{I}}\right)$ definido por $Z(w)=(Z_s(w))_{s\in\mathbb{I}}$ y $w\in\Omega$.

Nota 37.1.54 *La distribución de un proceso estocástico Z es la distribución de Z como un elemento aleatorio en $\left(E^{\mathbb{I}},\mathcal{E}^{\mathbb{I}}\right)$. La distribución de Z esta determinada de manera única por las distribuciones finito dimensionales.*

Nota 37.1.55 *En particular cuando Z toma valores reales, es decir, $(E,\mathcal{E})=(\mathbb{R},\mathcal{B})$ las distribuciones finito dimensionales están determinadas por las funciones de distribución finito dimensionales*

$$\mathbb{P}\left(Z_{t_1}\leq x_1,\ldots,Z_{t_n}\leq x_n\right),x_1,\ldots,x_n\in\mathbb{R},t_1,\ldots,t_n\in\mathbb{I},n\geq 1. \tag{37.1.16}$$

Nota 37.1.56 *Para espacios polacos $(E,\mathcal{E})$ el Teorema de Consistencia de Kolmogorov asegura que dada una colección de distribuciones finito dimensionales consistentes, siempre existe un proceso estocástico que posee tales distribuciones finito dimensionales.*

Definición 37.1.69 *Las trayectorias de Z son las realizaciones $Z(w)$ para $w \in \Omega$ del mapeo aleatorio Z.*

Nota 37.1.57 *Algunas restricciones se imponen sobre las trayectorias, por ejemplo que sean continuas por la derecha, o continuas por la derecha con límites por la izquierda, o de manera más general, se pedirá que caigan en algún subconjunto H de $E^{\mathbb{I}}$. En este caso es natural considerar a Z como un elemento aleatorio que no está en $\left(E^{\mathbb{I}}, \mathcal{E}^{\mathbb{I}}\right)$ sino en $(H, \mathcal{H})$, donde $\mathcal{H}$ es la σ-álgebra generada por los mapeos proyección que toman a $z \in H$ a $z_t \in E$ para $t \in \mathbb{I}$. A $\mathcal{H}$ se le conoce como la traza de H en $E^{\mathbb{I}}$, es decir,*

$$\mathcal{H} := E^{\mathbb{I}} \cap H := \left\{A \cap H : A \in E^{\mathbb{I}}\right\}. \tag{37.1.17}$$

Nota 37.1.58 *Z tiene trayectorias con valores en H y cada Z_t es un mapeo medible de $(\Omega, \mathcal{F})$ a $(H, \mathcal{H})$. Cuando se considera un espacio de trayectorias en particular H, al espacio $(H, \mathcal{H})$ se le llama el espacio de trayectorias de Z.*

Nota 37.1.59 *La distribución del proceso estocástico Z con espacio de trayectorias $(H, \mathcal{H})$ es la distribución de Z como un elemento aleatorio en $(H, \mathcal{H})$. La distribución, nuevemente, está determinada de manera única por las distribuciones finito dimensionales.*

Definición 37.1.70 *Sea Z un PEOSCT con espacio de estados $(E, \mathcal{E})$ y sea T un tiempo aleatorio en $[0, \infty)$. Por Z_T se entiende el mapeo con valores en E definido en Ω en la manera obvia:*

$$Z_T(w) := Z_{T(w)}(w) .w \in \Omega.$$

Definición 37.1.71 *Un PEOSCT Z es conjuntamente medible (**CM**) si el mapeo que toma $(w, t) \in \Omega \times [0, \infty)$ a $Z_t(w) \in E$ es $\mathcal{F} \otimes \mathcal{B}[0, \infty) / \mathcal{E}$ medible.*

Nota 37.1.60 *Un PEOSCT-CM implica que el proceso es medible, dado que Z_T es una composición de dos mapeos continuos: el primero que toma w en $(w, T(w))$ es $\mathcal{F}/\mathcal{F} \otimes \mathcal{B}[0, \infty)$ medible, mientras que el segundo toma $(w, T(w))$ en $Z_{T(w)}(w)$ es $\mathcal{F} \otimes \mathcal{B}[0, \infty) / \mathcal{E}$ medible.*

Definición 37.1.72 *Un PEOSCT con espacio de estados $(H, \mathcal{H})$ es canónicamente conjuntamente medible (**CCM**) si el mapeo $(z, t) \in H \times [0, \infty)$ en $Z_t \in E$ es $\mathcal{H} \otimes \mathcal{B}[0, \infty) / \mathcal{E}$ medible.*

Nota 37.1.61 *Un PEOSCTCCM implica que el proceso es CM, dado que un PECCM Z es un mapeo de $\Omega \times [0, \infty)$ a E, es la composición de dos mapeos medibles: el primero, toma (w, t) en $(Z(w), t)$ es $\mathcal{F} \otimes \mathcal{B}[0, \infty) / \mathcal{H} \otimes \mathcal{B}[0, \infty)$ medible, y el segundo que toma $(Z(w), t)$ en $Z_t(w)$ es $\mathcal{H} \otimes \mathcal{B}[0, \infty) / \mathcal{E}$ medible. Por tanto CCM es una condición más fuerte que CM.*

Definición 37.1.73 *Un conjunto de trayectorias H de un PEOSCT Z, es internamente shift-invariante (**ISI**) si*

$$\left\{(z_{t+s})_{s \in [0, \infty)} : z \in H\right\} = H,\ t \in [0, \infty).$$

Definición 37.1.74 *Dado un PEOSCTISI, se define el mapeo-shift θ_t, $t \in [0, \infty)$, de H a H por*

$$\theta_t z = (z_{t+s})_{s \in [0, \infty)},\ z \in H.$$

Definición 37.1.75 *Se dice que un proceso Z es shift-medible (**SM**) si Z tiene un conjunto de trayectorias H que es ISI y además el mapeo que toma $(z, t) \in H \times [0, \infty)$ en $\theta_t z \in H$ es $\mathcal{H} \otimes \mathcal{B}[0, \infty) / \mathcal{H}$ medible.*

Nota 37.1.62 *Un proceso estocástico con conjunto de trayectorias H ISI es shift-medible si y sólo si es CCM*

Nota 37.1.63
- *Dado el espacio polaco $(E, \mathcal{E})$ se tiene el conjunto de trayectorias $D_E[0, \infty)$ que es ISI, entonces cumpe con ser CCM.*
- *Si G es abierto, podemos cubrirlo por bolas abiertas cuay cerradura este contenida en G, y como G es segundo numerable como subespacio de E, lo podemos cubrir por una cantidad numerable de bolas abiertas.*

Nota 37.1.64 *Los procesos estocásticos Z a tiempo discreto con espacio de estados polaco, también tiene un espacio de trayectorias polaco y por tanto tiene distribuciones condicionales regulares.*

Teorema 37.1.20 *El producto numerable de espacios polacos es polaco.*

Definición 37.1.76 *Sea $(\Omega, \mathcal{F}, \mathbb{P})$ espacio de probabilidad que soporta al proceso $Z = (Z_s)_{s\in[0,\infty)}$ y $S = (S_k)_0^\infty$ donde Z es un PEOSCTM con espacio de estados $(E, \mathcal{E})$ y espacio de trayectorias $(H, \mathcal{H})$ y además S es una sucesión de tiempos aleatorios one-sided que satisfacen la condición $0 \leq S_0 < S_1 < \cdots \to \infty$. Considerando S como un mapeo medible de $(\Omega, \mathcal{F})$ al espacio sucesión $(L, \mathcal{L})$, donde*

$$L = \left\{ (s_k)_0^\infty \in [0,\infty)^{\{0,1,\ldots\}} : s_0 < s_1 < \cdots \to \infty \right\},$$

donde $\mathcal{L}$ son los subconjuntos de Borel de L, es decir, $\mathcal{L} = L \cap \mathcal{B}^{\{0,1,\ldots\}}$.

Así el par (Z, S) es un mapeo medible de $(\Omega, \mathcal{F})$ en $(H \times L, \mathcal{H} \otimes \mathcal{L})$. El par $\mathcal{H} \otimes \mathcal{L}^+$ denotará la clase de todas las funciones medibles de $(H \times L, \mathcal{H} \otimes \mathcal{L})$ en $([0,\infty), \mathcal{B}[0,\infty))$.

Definición 37.1.77 *Sea θ_t el mapeo-shift conjunto de $H \times L$ en $H \times L$ dado por*

$$\theta_t\left(z, (s_k)_0^\infty\right) = \theta_t\left(z, \left(s_{n_{t-}+k} - t\right)_0^\infty\right)$$

donde $n_{t-} = inf\{n \geq 1 : s_n \geq t\}$.

Nota 37.1.65 *Con la finalidad de poder realizar los shift's sin complicaciones de medibilidad, se supondrá que Z es shit-medible, es decir, el conjunto de trayectorias H es invariante bajo shifts del tiempo y el mapeo que toma $(z,t) \in H \times [0,\infty)$ en $z_t \in E$ es $\mathcal{H} \otimes \mathcal{B}[0,\infty)/\mathcal{E}$ medible.*

Definición 37.1.78 *Dado un proceso **PEOSSM** (Proceso Estocástico One Side Shift Medible) Z, se dice regenerativo clásico con tiempos de regeneración S si*

$$\theta_{S_n}(Z, S) = \left(Z^0, S^0\right), n \geq 0$$

y además $\theta_{S_n}(Z, S)$ es independiente de $((Z_s)\, s \in [0, S_n), S_0, \ldots, S_n)$ Si lo anterior se cumple, al par (Z, S) se le llama regenerativo clásico.

Nota 37.1.66 *Si el par (Z, S) es regenerativo clásico, entonces las longitudes de los ciclos $X_1, X_2, \ldots,$ son i.i.d. e independientes de la longitud del retraso S_0, es decir, S es un proceso de renovación. Las longitudes de los ciclos también son llamados tiempos de inter-regeneración y tiempos de ocurrencia.*

Teorema 37.1.21 *Supóngase que el par (Z, S) es regenerativo clásico con $\mathbb{E}[X_1] < \infty$. Entonces (Z^*, S^*) en el teorema 2.1 es una versión estacionaria de (Z, S). Además, si X_1 es lattice con span d, entonces (Z^{**}, S^{**}) en el teorema 2.2 es una versión periodicamente estacionaria de (Z, S) con periodo d.*

Definición 37.1.79 *Una variable aleatoria X_1 es spread out si existe una $n \geq 1$ y una función $f \in \mathcal{B}^+$ tal que $\int_{\mathbb{R}} f(x)\, dx > 0$ con $X_2, X_3, \ldots, X_n$ copias i.i.d de X_1,*

$$\mathbb{P}(X_1 + \cdots + X_n \in B) \geq \int_B f(x)\, dx$$

para $B \in \mathcal{B}$.

Definición 37.1.80 *Dado un proceso estocástico Z se le llama wide-sense regenerative (**WSR**) con tiempos de regeneración S si $\theta_{S_n}(Z, S) = \left(Z^0, S^0\right)$ para $n \geq 0$ en distribución y $\theta_{S_n}(Z, S)$ es independiente de $(S_0, S_1, \ldots, S_n)$ para $n \geq 0$. Se dice que el par (Z, S) es WSR si lo anterior se cumple.*

Nota 37.1.67
- *El proceso de trayectorias $(\theta_s Z)_{s\in[0,\infty)}$ es WSR con tiempos de regeneración S pero no es regenerativo clásico.*
- *Si Z es cualquier proceso estacionario y S es un proceso de renovación que es independiente de Z, entonces (Z, S) es WSR pero en general no es regenerativo clásico*

Nota 37.1.68 *Para cualquier proceso estocástico Z, el proceso de trayectorias $(\theta_s Z)_{s\in[0,\infty)}$ es siempre un proceso de Markov.*

Teorema 37.1.22 *Supongase que el par (Z, S) es WSR con $\mathbb{E}[X_1] < \infty$. Entonces (Z^*, S^*) en el teorema 2.1 es una versión estacionaria de (Z, S).*

Teorema 37.1.23 *Supongase que (Z, S) es cycle-stationary con $\mathbb{E}[X_1] < \infty$. Sea U distribuida uniformemente en $[0,1)$ e independiente de $\left(Z^0, S^0\right)$ y sea $\mathbb{P}^*$ la medida de probabilidad en $(\Omega, \mathbb{P})$ definida por*

$$d\mathbb{P}^* = \frac{X_1}{\mathbb{E}[X_1]} d\mathbb{P}$$

. Sea (Z^*, S^*) con distribución $\mathbb{P}^*\left(\theta_{UX_1}\left(Z^0, S^0\right) \in \cdot\right)$. Entonces $(Z*, S^*)$ es estacionario,

$$\mathbb{E}\left[f\left(Z^*, S^*\right)\right] = \mathbb{E}\left[\int_0^{X_1} f\left(\theta_s\left(Z^0, S^0\right)\right) ds\right] / \mathbb{E}\left[X_1\right]$$

$f \in \mathcal{H} \otimes \mathcal{L}^+$, and S_0^* es continuo con función distribución G_∞ definida por

$$G_\infty(x) := \frac{\mathbb{E}\left[X_1\right] \wedge x}{\mathbb{E}\left[X_1\right]}$$

para $x \geq 0$ y densidad $\mathbb{P}\left[X_1 > x\right] / \mathbb{E}\left[X_1\right]$, con $x \geq 0$.

Teorema 37.1.24 *Sea Z un Proceso Estocástico un lado shift-medible one-sided shift-measurable stochastic process, (PEOSSM), y S_0 y S_1 tiempos aleatorios tales que $0 \leq S_0 < S_1$ y*

$$\theta_{S_1} Z = \theta_{S_0} Z \text{ en distribución.} \tag{37.1.18}$$

Entonces el espacio de probabilidad subyacente $(\Omega, \mathcal{F}, \mathbb{P})$ puede extenderse para soportar una sucesión de tiempos aleatorios S tales que

$$\theta_{S_n}(Z, S) = \left(Z^0, S^0\right), n \geq 0, \text{ en distribución,} \tag{37.1.19}$$

$$(Z, S_0, S_1) \text{ depende de } (X_2, X_3, \ldots) \text{ solamente a traves de } \theta_{S_1} Z. \tag{37.1.20}$$

37.2. Procesos Regenerativos

37.2.1. Procesos Regenerativos Sigman, Thorisson y Wolff [40]

Definición 37.2.1 (Definición Clásica) *Un proceso estocástico $X = \{X(t) : t \geq 0\}$ es llamado regenerativo is existe una variable aleatoria $R_1 > 0$ tal que*

i) $\{X(t + R_1) : t \geq 0\}$ es independiente de $\{\{X(t) : t < R_1\},\}$

ii) $\{X(t + R_1) : t \geq 0\}$ es estocásticamente equivalente a $\{X(t) : t > 0\}$

Llamamos a R_1 tiempo de regeneración, y decimos que X se regenera en este punto.

$\{X(t + R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Nota 37.2.1 *La existencia de un primer tiempo de regeneración, R_1, implica la existencia de una sucesión completa de estos tiempos $R_1, R_2 \ldots$, que satisfacen la propiedad deseada [40].*

Nota 37.2.2 *Para la cola $GI/GI/1$ los usuarios arriban con tiempos t_n y son atendidos con tiempos de servicio S_n, los tiempos de arribo forman un proceso de renovación con tiempos entre arribos independientes e identicamente distribuidos (`i.i.d.`)$T_n = t_n - t_{n-1}$, además los tiempos de servicio son `i.i.d.` e independientes de los procesos de arribo. Por estable se entiende que $\mathbb{E}S_n < \mathbb{E}T_n < \infty$.*

Definición 37.2.2 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t} \int_0^\infty X(u)\, du \\ \mathbb{P}\left(X_\infty \leq x\right) &= lim_{t\to\infty} \frac{1}{t} \int_0^\infty I_x(u)\, du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\, dt\right]}{\mathbb{E}\left[R_1\right]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.2.3 *Funciones de procesos regenerativos son regenerativas, es decir, si $X(t)$ es regenerativo y se define el proceso $Y(t)$ por $Y(t) = f(X(t))$ para alguna función Borel medible $f(\cdot)$. Además Y es regenerativo con los mismos tiempos de renovación que X.*

En general, los tiempos de renovación, Z_k de un proceso regenerativo no requieren ser tiempos de paro con respecto a la evolución de $X(t)$.

Nota 37.2.4 *Una función de un proceso de Markov, usualmente no será un proceso de Markov, sin embargo será regenerativo si el proceso de Markov lo es.*

Nota 37.2.5 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Nota 37.2.6 *a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.*

b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

37.2.2. Procesos Regenerativos Estacionarios - Stidham [41]

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\{V(t-s) \in A | X_1 > t - s\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones (*puntos de regeneración*) que ocurren en $[0, t]$. El intervalo $[0, X_1)$ es llamado *primer ciclo de regeneración* de $\{V(t), t \geq 0\}$, $[X_1, X_1 + X_2)$ el *segundo ciclo de regeneración*, y así sucesivamente.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 37.2.3 *Se define el proceso estacionario, $\{V^*(t), t \geq 0\}$, para $\{V(t), t \geq 0\}$ por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]} \int_0^\infty \mathbb{P}\{V(t+x) \in A | X > x\}(1 - F(x))\, dx,$$

para todo $t \geq 0$ y todo conjunto de Borel A.

Definición 37.2.4 *Una distribución se dice que es* aritmética *si todos sus puntos de incremento son múltiplos de la forma $0, \lambda, 2\lambda, \ldots$ para alguna $\lambda > 0$ entera.*

Definición 37.2.5 *Una modificación medible de un proceso $\{V(t), t \geq 0\}$, es una versión de este, $\{V(t, w)\}$ conjuntamente medible para $t \geq 0$ y para $w \in S$, S espacio de estados para $\{V(t), t \geq 0\}$.*

Teorema 37.2.1 *Sea $\{V(t), t \geq\}$ un proceso regenerativo no negativo con modificación medible. Sea $\mathbb{E}[X] < \infty$. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de t, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\, ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$, equivalentemente, si $\mathbb{E}\left[\int_0^X V(s)\, ds\right] < \infty$,entonces

$$\frac{\int_0^t V(s)\, ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\, ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$.

Corolario 37.2.1 *Sea $\{V(t), t \geq 0\}$ un proceso regenerativo no negativo, con modificación medible. Si $\mathbb{E} < \infty$, F es no-aritmética, y para todo $x \geq 0$, $P\{V(t) \leq x, C > x\}$ es de variación acotada como función de t en cada intervalo finito $[0, \tau]$, entonces $V(t)$ converge en distribución cuando $t \to \infty$ y*

$$\mathbb{E}V = \frac{\mathbb{E}\int_0^X V(s)\, ds}{\mathbb{E}X}$$

Donde V tiene la distribución límite de $V(t)$ cuando $t \to \infty$.

Para el caso discreto se tienen resultados similares.

Procesos de Renovación

Definición 37.2.6 *Sean $0 \leq T_1 \leq T_2 \leq \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0,t)$ es*

$$N(t) = \sum_{n=1}^{\infty} 1\!\!1 (T_n \leq t), \tag{37.2.1}$$

para $t \geq 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.2.7 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \geq 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0,t)$*

Nota 37.2.7 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^{n} \xi_k$ y $N(t) = \sum_{n=1}^{\infty} 1\!\!1 (T_n \leq t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes NÃºmeros.*

Teorema Principal de Renovación

Nota 37.2.8 *Una función $h : \mathbb{R}_+ \to \mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ es decreciente y Riemann Integrable.

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)| \leq b(t)$, donde b es DRI.

Teorema 37.2.2 (Teorema Principal de Renovación) *Si F es no aritmética y $h(t)$ es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty} U \star h = \frac{1}{\mu} \int_{\mathbb{R}_+} h(s)\, ds.$$

Proposición 37.2.1 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t < 0$ puede expresarse como*

$$H(t) = U \star h(t), \text{ donde } h(t) = H(t) - F \star H(t)$$

Definición 37.2.8 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}[X(T+t)|T] = \mathbb{E}[X(t)], \text{ para } t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.2.2 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}[X(t)] = U \star h(t), \text{ donde } h(t) = \mathbb{E}[X(t)\, 1\!\!1 (T > t)].$$

Teorema 37.2.3 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M = \sup\{|X(t)| : t \leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty} \mathbb{E}[X(t)] = \frac{1}{\mu} \int_{\mathbb{R}_+} h(s)\, ds,$$

donde $h(t) = \mathbb{E}[X(t)\, 1\!\!1 (T > t)]$.

Propiedades de los Procesos de Renovación

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq \quad t &< T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.2.3 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Nota 37.2.9 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.2.4 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{37.2.2}$$

$$lim_{t\to\infty} t^{-1} N(t) = 1/\mu, \ c.s. \tag{37.2.3}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.2.2 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1} N(t) \to 1/\mu, \ c.s. \ cuando \ t \to \infty. \tag{37.2.4}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.2.9 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.2.5 *Supóngase que $n^{-1} T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \ c.s. \tag{37.2.5}$$

$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \ c.s. \tag{37.2.6}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.2.3 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \text{ c.s. cuando } t \to \infty. \tag{37.2.7}$$

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq \quad t &< T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.2.4 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Nota 37.2.10 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.2.6 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \text{ c.s.} \tag{37.2.8}$$

$$lim_{t\to\infty} t^{-1} N(t) = 1/\mu, \text{ c.s.} \tag{37.2.9}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.2.4 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1} N(t) \to 1/\mu, \text{ c.s. cuando } t \to \infty. \tag{37.2.10}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.2.10 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.2.7 *Supóngase que $n^{-1} T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \text{ c.s.} \tag{37.2.11}$$

$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \text{ c.s.} \tag{37.2.12}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.2.5 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \text{ c.s. cuando } t \to \infty. \tag{37.2.13}$$

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq \quad t &< T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \text{ c.s.} \tag{37.2.29}$$

$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \text{ c.s.} \tag{37.2.30}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.2.11 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \text{ c.s. cuando } t \to \infty. \tag{37.2.31}$$

Función de Renovación

Definición 37.2.14 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t<0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t)=h(t)+\int_{[0,t]}H(t-s)\,dF(s)\,,\ t\geq 0, \tag{37.2.32}$$

donde $H(t)$ es una función de valores reales. Esto es $H=h+F\star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t<0$.

Proposición 37.2.8 *La función $U\star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.2.14 (Teorema Renovación Elemental)

$$t^{-1}U(t)\to 1/\mu,\ \textit{cuando}\ t\to\infty.$$

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.2.15 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t)=\sum_{n=1}^{\infty}F^{n\star}(t)\,,\ t\geq 0,$$

donde $F^{0\star}(t)=\mathbb{1}(t\geq 0)$.

Proposición 37.2.9 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t>0$, y es $U^{'}(t)=\sum_{n=0}^{\infty}f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t)>N(t-)\}=0,\ t\geq 0.$$

Definición 37.2.16 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha)=\int_{\mathbb{R}_+}e^{-\alpha t}dF(t)\,,\ \alpha\geq 0.$$

Entonces

$$\hat{U}(\alpha)=\sum_{n=0}^{\infty}F^{\hat{n}\star}(\alpha)=\sum_{n=0}^{\infty}\hat{F}(\alpha)^{n}=\frac{1}{1-\hat{F}(\alpha)}.$$

Proposición 37.2.10 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha)=\frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.2.14 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)]=\lambda t$, para $t\geq 0$.*

Teorema 37.2.15 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t)=\mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f:\mathbb{R}_+\to\mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()}f(T_n)\right]=\int_{(0,t]}f(s)\,d\eta(s)\,,\ t\geq 0,$$

suponiendo que la integral exista. Además si $X_1,X_2,\ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n|T_n=s]=f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)}X_n\right]=\int_{(0,t]}f(s)\,d\eta(s)\,,\ t\geq 0,$$

suponiendo que la integral exista.

Corolario 37.2.12 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right]=\mu\mathbb{E}[N(t)+1]\,,\ t\geq 0,$$

Definición 37.2.17 *Sean $0 \leq T_1 \leq T_2 \leq \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0,t)$ es*

$$N(t) = \sum_{n=1}^{\infty} 1\!\!1 (T_n \leq t), \tag{37.2.33}$$

para $t \geq 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.2.18 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \geq 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0,t)$*

Nota 37.2.15 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^{n} \xi_k$ y $N(t) = \sum_{n=1}^{\infty} 1\!\!1 (T_n \leq t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes NÃºmeros.*

Renewal and Regenerative Processes: Serfozo[35]

Definición 37.2.19 *Sean $0 \leq T_1 \leq T_2 \leq \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0,t)$ es*

$$N(t) = \sum_{n=1}^{\infty} 1\!\!1 (T_n \leq t), \tag{37.2.34}$$

para $t \geq 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.2.20 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \geq 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0,t)$*

Nota 37.2.16 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^{n} \xi_k$ y $N(t) = \sum_{n=1}^{\infty} 1\!\!1 (T_n \leq t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes Números.*

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq \quad t &< T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.2.11 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Ejemplo 37.2.1 (Proceso Poisson) *Suponga que se tienen tiempos de inter-renovación i.i.d. del proceso de renovación $N(t)$ tienen distribución exponencial $F(t) = q - e^{-\lambda t}$ con tasa λ. Entonces $N(t)$ es un proceso Poisson con tasa λ.*

Nota 37.2.17 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.2.16 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{37.2.35}$$

$$lim_{t\to\infty} t^{-1} N(t) = 1/\mu, \ c.s. \tag{37.2.36}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.2.13 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1} N(t) \to 1/\mu, \ c.s. \ cuando \ t \to \infty. \tag{37.2.37}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.2.21 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.2.17 *Supóngase que $n^{-1} T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \ c.s. \tag{37.2.38}$$

$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \ c.s. \tag{37.2.39}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.2.14 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \ c.s. \ cuando \ t \to \infty. \tag{37.2.40}$$

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.2.22 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t) = \sum_{n=1}^{\infty} F^{n\star}(t), \ t \geq 0,$$

donde $F^{0\star}(t) = \mathbb{1}(t \geq 0)$.

Proposición 37.2.12 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t > 0$, y es $U^{'}(t) = \sum_{n=0}^{\infty} f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t) > N(t-)\} = 0,\ t \geq 0.$$

Definición 37.2.23 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha) = \int_{\mathbb{R}_+} e^{-\alpha t} dF(t),\ \alpha \geq 0.$$

Entonces

$$\hat{U}(\alpha) = \sum_{n=0}^{\infty} F^{\hat{n}\star}(\alpha) = \sum_{n=0}^{\infty} \hat{F}(\alpha)^n = \frac{1}{1-\hat{F}(\alpha)}.$$

Proposición 37.2.13 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha) = \frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.2.18 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)] = \lambda t$, para $t \geq 0$.*

Teorema 37.2.18 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t) = \mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f : \mathbb{R}_+ \to \mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()} f(T_n)\right] = \int_{(0,t]} f(s)\, d\eta(s),\ t \geq 0,$$

suponiendo que la integral exista. Además si $X_1, X_2, \ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n | T_n = s] = f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)} X_n\right] = \int_{(0,t]} f(s)\, d\eta(s),\ t \geq 0,$$

suponiendo que la integral exista.

Corolario 37.2.15 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right] = \mu \mathbb{E}[N(t)+1],\ t \geq 0,$$

Definición 37.2.24 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t < 0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t) = h(t) + \int_{[0,t]} H(t-s)\, dF(s),\ t \geq 0, \tag{37.2.41}$$

donde $H(t)$ es una función de valores reales. Esto es $H = h + F \star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t < 0$.

Proposición 37.2.14 *La función $U \star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.2.19 (Teorema Renovación Elemental)

$$t^{-1}U(t) \to 1/\mu,\ \textit{cuando}\ t \to \infty.$$

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.2.25 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t) = \sum_{n=1}^{\infty} F^{n\star}(t),\ t \geq 0,$$

donde $F^{0\star}(t) = \mathbb{1}(t \geq 0)$.

Proposición 37.2.15 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t > 0$, y es $U^{'}(t) = \sum_{n=0}^{\infty} f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t) > N(t-)\} = 0,\ t \geq 0.$$

Definición 37.2.26 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha) = \int_{\mathbb{R}_+} e^{-\alpha t} dF(t),\ \alpha \geq 0.$$

Entonces

$$\hat{U}(\alpha) = \sum_{n=0}^{\infty} F^{\hat{n}\star}(\alpha) = \sum_{n=0}^{\infty} \hat{F}(\alpha)^n = \frac{1}{1-\hat{F}(\alpha)}.$$

Proposición 37.2.16 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha) = \frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.2.19 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)] = \lambda t$, para $t \geq 0$.*

Teorema 37.2.20 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t) = \mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f : \mathbb{R}_+ \to \mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()} f(T_n)\right] = \int_{(0,t]} f(s)\, d\eta(s),\ t \geq 0,$$

suponiendo que la integral exista. Además si $X_1, X_2, \ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n | T_n = s] = f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)} X_n\right] = \int_{(0,t]} f(s)\, d\eta(s),\ t \geq 0,$$

suponiendo que la integral exista.

Corolario 37.2.16 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right] = \mu \mathbb{E}[N(t)+1],\ t \geq 0,$$

Definición 37.2.27 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t < 0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t) = h(t) + \int_{[0,t]} H(t-s)\, dF(s),\ t \geq 0, \tag{37.2.42}$$

donde $H(t)$ es una función de valores reales. Esto es $H = h + F \star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t < 0$.

Proposición 37.2.17 *La función $U \star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.2.21 (Teorema Renovación Elemental)

$$t^{-1}U(t) \to 1/\mu,\ \textit{cuando}\ t \to \infty.$$

Nota 37.2.20 *Una función $h : \mathbb{R}_+ \to \mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ es decreciente y Riemann Integrable.

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)| \leq b(t)$, donde b es DRI.

Teorema 37.2.22 (Teorema Principal de Renovación) *Si F es no aritmética y $h(t)$ es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty} U \star h = \frac{1}{\mu} \int_{\mathbb{R}_+} h(s)\, ds.$$

Proposición 37.2.18 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t<0$ puede expresarse como*

$$H(t) = U \star h(t), \text{ donde } h(t) = H(t) - F \star H(t)$$

Definición 37.2.28 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}[X(T+t)|T] = \mathbb{E}[X(t)], \text{ para } t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.2.19 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}[X(t)] = U \star h(t), \text{ donde } h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T>t)].$$

Teorema 37.2.23 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M = \sup\{|X(t)| : t \leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}[X(t)] = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds,$$

donde $h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T>t)]$.

Nota 37.2.21 *Una función $h : \mathbb{R}_+ \to \mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ es decreciente y Riemann Integrable.

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)| \leq b(t)$, donde b es DRI.

Teorema 37.2.24 (Teorema Principal de Renovación) *Si F es no aritmética y $h(t)$ es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty} U \star h = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds.$$

Proposición 37.2.20 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t<0$ puede expresarse como*

$$H(t) = U \star h(t), \text{ donde } h(t) = H(t) - F \star H(t)$$

Definición 37.2.29 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}[X(T+t)|T] = \mathbb{E}[X(t)], \text{ para } t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.2.21 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}[X(t)] = U \star h(t), \text{ donde } h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T>t)].$$

Teorema 37.2.25 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M = \sup\{|X(t)| : t \leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}[X(t)] = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds,$$

donde $h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T>t)]$.

Definición 37.2.30 *Para el proceso $\{(N(t), X(t)) : t \geq 0\}$, sus trayectoria muestrales en el intervalo de tiempo $[T_{n-1}, T_n)$ están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1}+t) : 0 \leq t < \xi_n\})$$

Este ζ_n es el n-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos T_n si sus segmentos ζ_n son independientes e idénticamennte distribuidos.

Nota 37.2.22 *Si $\tilde{X}(t)$ con espacio de estados $\tilde{S}$ es regenerativo sobre T_n, entonces $X(t) = f\left(\tilde{X}(t)\right)$ también es regenerativo sobre T_n, para cualquier función $f : \tilde{S} \to S$.*

Nota 37.2.23 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Nota 37.2.24 *Un proceso estocástico a tiempo continuo o discreto es regenerativo si existe un proceso de renovación tal que los segmentos del proceso entre tiempos de renovación sucesivos son i.i.d., es decir, para* $\{X(t) : t \geq 0\}$ *proceso estocástico a tiempo continuo con espacio de estados* S*, espacio métrico.*

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Definición 37.2.31 *Para el proceso* $\{(N(t), X(t)) : t \geq 0\}$*, sus trayectoria muestrales en el intervalo de tiempo* $[T_{n-1}, T_n)$ *están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1} + t) : 0 \leq t < \xi_n\})$$

Este ζ_n *es el* n*-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos* T_n *si sus segmentos* ζ_n *son independientes e idénticamennte distribuidos.*

Nota 37.2.25 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Teorema 37.2.26 (Procesos Regenerativos) *Suponga que el proceso*

Definición 37.2.32 (Renewal Process Trinity) *Para un proceso de renovación* $N(t)$*, los siguientes procesos proveen de información sobre los tiempos de renovación.*

- $A(t) = t - T_{N(t)}$*, el tiempo de recurrencia hacia atrás al tiempo* t*, que es el tiempo desde la última renovación para* t*.*
- $B(t) = T_{N(t)+1} - t$*, el tiempo de recurrencia hacia adelante al tiempo* t*, residual del tiempo de renovación, que es el tiempo para la próxima renovación después de* t*.*
- $L(t) = \xi_{N(t)+1} = A(t) + B(t)$*, la longitud del intervalo de renovación que contiene a* t*.*

Nota 37.2.26 *El proceso tridimensional* $(A(t), B(t), L(t))$ *es regenerativo sobre* T_n*, y por ende cada proceso lo es. Cada proceso* $A(t)$ *y* $B(t)$ *son procesos de MArkov a tiempo continuo con trayectorias continuas por partes en el espacio de estados* $\mathbb{R}_+$*. Una expresión conveniente para su distribución conjunta es, para* $0 \leq x < t, y \geq 0$

$$P\{A(t) > x, B(t) > y\} = P\{N(t+y) - N((t-x)) = 0\} \tag{37.2.43}$$

Ejemplo 37.2.2 (Tiempos de recurrencia Poisson) *Si* $N(t)$ *es un proceso Poisson con tasa* λ*, entonces de la expresión (37.8.10) se tiene que*

$$P\{A(t) > x, B(t) > y\} = e^{-\lambda(x+y)}, \quad 0 \leq x < t, y \geq 0,$$

que es la probabilidad Poisson de no renovaciones en un intervalo de longitud $x + y$*.*

Una cadena de Markov ergódica tiene la propiedad de ser estacionaria si la distribución de su estado al tiempo 0 es su distribución estacionaria.

Definición 37.2.33 *Un proceso estocástico a tiempo continuo* $\{X(t) : t \geq 0\}$ *en un espacio general es estacionario si sus distribuciones finito dimensionales son invariantes bajo cualquier traslado: para cada* $0 \leq s_1 < s_2 < \cdots < s_k$ *y* $t \geq 0$*,*

$$(X(s_1 + t), \ldots, X(s_k + t)) =_d (X(s_1), \ldots, X(s_k)).$$

Nota 37.2.27 *Un proceso de Markov es estacionario si* $X(t) =_d X(0)$*,* $t \geq 0$*.*

Considerese el proceso $N(t) = \sum_n \mathbb{1}(\tau_n \leq t)$ en $\mathbb{R}_+$, con puntos $0 < \tau_1 < \tau_2 < \cdots$.

Proposición 37.2.22 *Si* N *es un proceso puntual estacionario y* $\mathbb{E}[N(1)] < \infty$*, entonces* $\mathbb{E}[N(t)] = t\mathbb{E}[N(1)]$*,* $t \geq 0$

Teorema 37.2.27 *Los siguientes enunciados son equivalentes*

i) *El proceso retardado de renovación* N *es estacionario.*
ii) *EL proceso de tiempos de recurrencia hacia adelante* $B(t)$ *es estacionario.*
iii) $\mathbb{E}[N(t)] = t/\mu$*,*
iv) $G(t) = F_e(t) = \frac{1}{\mu}\int_0^t [1 - F(s)]\, ds$

Cuando estos enunciados son ciertos, $P\{B(t) \leq x\} = F_e(x)$*, para* $t, x \geq 0$*.*

Nota 37.2.28 *Una consecuencia del teorema anterior es que el Proceso Poisson es el único proceso sin retardo que es estacionario.*

Corolario 37.2.17 *El proceso de renovación* $N(t)$ *sin retardo, y cuyos tiempos de inter renonación tienen media finita, es estacionario si y sólo si es un proceso Poisson.*

Procesos Regenerativos

Nota 37.2.29 *Si $\tilde{X}(t)$ con espacio de estados $\tilde{S}$ es regenerativo sobre T_n, entonces $X(t) = f\left(\tilde{X}(t)\right)$ también es regenerativo sobre T_n, para cualquier función $f : \tilde{S} \to S$.*

Nota 37.2.30 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Definición 37.2.34 (Definición Clásica) *Un proceso estocástico $X = \{X(t) : t \geq 0\}$ es llamado regenerativo is existe una variable aleatoria $R_1 > 0$ tal que*

i) $\{X(t + R_1) : t \geq 0\}$ *es independiente de* $\{\{X(t) : t < R_1\},\}$

ii) $\{X(t + R_1) : t \geq 0\}$ *es estocásticamente equivalente a* $\{X(t) : t > 0\}$

Llamamos a R_1 tiempo de regeneración, y decimos que X se regenera en este punto.

$\{X(t + R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Definición 37.2.35 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t} \int_0^\infty X(u)\, du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t} \int_0^\infty I_x(u)\, du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\, dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.2.31 *a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.*

b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Definición 37.2.36 *Para el proceso $\{(N(t), X(t)) : t \geq 0\}$, sus trayectoria muestrales en el intervalo de tiempo $[T_{n-1}, T_n)$ están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1} + t) : 0 \leq t < \xi_n\})$$

Este ζ_n es el n-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos T_n si sus segmentos ζ_n son independientes e idénticamennte distribuidos.

Nota 37.2.32 *Si $\tilde{X}(t)$ con espacio de estados $\tilde{S}$ es regenerativo sobre T_n, entonces $X(t) = f\left(\tilde{X}(t)\right)$ también es regenerativo sobre T_n, para cualquier función $f : \tilde{S} \to S$.*

Nota 37.2.33 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Definición 37.2.37 (Definición Clásica) *Un proceso estocástico $X = \{X(t) : t \geq 0\}$ es llamado regenerativo is existe una variable aleatoria $R_1 > 0$ tal que*

i) $\{X(t + R_1) : t \geq 0\}$ *es independiente de* $\{\{X(t) : t < R_1\},\}$

ii) $\{X(t+R_1) : t \geq 0\}$ *es estocásticamente equivalente a* $\{X(t) : t > 0\}$

Llamamos a R_1 *tiempo de regeneración, y decimos que* X *se regenera en este punto.*

$\{X(t+R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Nota 37.2.34 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Definición 37.2.38 *Para* x *fijo y para cada* $t \geq 0$*, sea* $I_x(t) = 1$ *si* $X(t) \leq x$*,* $I_x(t) = 0$ *en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty X(u)\,du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty I_x(u)\,du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\,dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.2.35 *a) Si el proceso regenerativo* X *es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.*

b) Si X *es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso,* $X_e = \{X_e(t)\}$*, donde* X_e *es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como* X_∞

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\{V(t-s) \in A | X_1 > t-s\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones (*puntos de regeneración*) que ocurren en $[0,t]$. El intervalo $[0, X_1)$ es llamado *primer ciclo de regeneración* de $\{V(t), t \geq 0\}$, $[X_1, X_1 + X_2)$ el *segundo ciclo de regeneración*, y así sucesivamente.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 37.2.39 *Se define el proceso estacionario,* $\{V^*(t), t \geq 0\}$*, para* $\{V(t), t \geq 0\}$ *por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]}\int_0^\infty \mathbb{P}\{V(t+x) \in A | X > x\}(1 - F(x))\,dx,$$

para todo $t \geq 0$ *y todo conjunto de Borel* A*.*

Definición 37.2.40 *Una distribución se dice que es* aritmética *si todos sus puntos de incremento son múltiplos de la forma* $0, \lambda, 2\lambda, \ldots$ *para alguna* $\lambda > 0$ *entera.*

Definición 37.2.41 *Una modificación medible de un proceso* $\{V(t), t \geq 0\}$*, es una versión de este,* $\{V(t,w)\}$ *conjuntamente medible para* $t \geq 0$ *y para* $w \in S$*,* S *espacio de estados para* $\{V(t), t \geq 0\}$*.*

Teorema 37.2.28 *Sea* $\{V(t), t \geq\}$ *un proceso regenerativo no negativo con modificación medible. Sea* $\mathbb{E}[X] < \infty$*. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de* t*, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$*, equivalentemente, si* $\mathbb{E}\left[\int_0^X V(s)\,ds\right] < \infty$*,entonces*

$$\frac{\int_0^t V(s)\,ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$*.*

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\left\{V(t-s) \in A | X_1 > t - s\right\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones (*puntos de regeneración*) que ocurren en $[0, t]$. El intervalo $[0, X_1)$ es llamado *primer ciclo de regeneración* de $\{V(t), t \geq 0\}$, $[X_1, X_1 + X_2)$ el *segundo ciclo de regeneración*, y así sucesivamente.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 37.2.42 *Se define el proceso estacionario,* $\{V^*(t), t \geq 0\}$*, para* $\{V(t), t \geq 0\}$ *por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]} \int_0^\infty \mathbb{P}\{V(t+x) \in A | X > x\}(1 - F(x))\,dx,$$

para todo $t \geq 0$ *y todo conjunto de Borel* A*.*

Definición 37.2.43 *Una distribución se dice que es* aritmética *si todos sus puntos de incremento son múltiplos de la forma* $0, \lambda, 2\lambda, \ldots$ *para alguna* $\lambda > 0$ *entera.*

Definición 37.2.44 *Una modificación medible de un proceso* $\{V(t), t \geq 0\}$*, es una versión de este,* $\{V(t, w)\}$ *conjuntamente medible para* $t \geq 0$ *y para* $w \in S$*,* S *espacio de estados para* $\{V(t), t \geq 0\}$*.*

Teorema 37.2.29 *Sea* $\{V(t), t \geq\}$ *un proceso regenerativo no negativo con modificación medible. Sea* $\mathbb{E}[X] < \infty$*. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de* t*, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$*, equivalentemente, si* $\mathbb{E}\left[\int_0^X V(s)\,ds\right] < \infty$*,entonces*

$$\frac{\int_0^t V(s)\,ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$*.*

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

37.2.3. Puntos de Renovación

Para cada cola Q_i se tienen los procesos de arribo a la cola, para estas, los tiempos de arribo están dados por

$$\left\{T_1^i, T_2^i, \ldots, T_k^i, \ldots\right\},$$

entonces, consideremos solamente los primeros tiempos de arribo a cada una de las colas, es decir,

$$\left\{T_1^1, T_1^2, T_1^3, T_1^4\right\},$$

se sabe que cada uno de estos tiempos se distribuye de manera exponencial con parámetro $1/mu_i$. Además se sabe que para

$$T^* = \text{mín}\left\{T_1^1, T_1^2, T_1^3, T_1^4\right\},$$

T^* se distribuye de manera exponencial con parámetro

$$\mu^* = \sum_{i=1}^{4} \mu_i.$$

Ahora, dado que

$$\tilde{r} = r_1 + r_2 \quad \text{y} \quad \hat{r} = r_3 + r_4.$$

Supongamos que

$$\tilde{r}, \hat{r} < \mu^*,$$

entonces si tomamos

$$r^* = \text{mín}\left\{\tilde{r}, \hat{r}\right\},$$

se tiene que para

$$t^* \in (0, r^*)$$

se cumple que

$$\tau_1(1) = 0 \quad \text{y por tanto} \quad \overline{\tau}_1 = 0,$$

entonces para la segunda cola en este primer ciclo se cumple que

$$\tau_2 = \overline{\tau}_1 + r_1 = r_1 < \mu^*,$$

y por tanto se tiene que

$$\overline{\tau}_2 = \tau_2.$$

Por lo tanto, nuevamente para la primer cola en el segundo ciclo

$$\tau_1(2) = \tau_2(1) + r_2 = \tilde{r} < \mu^*.$$

Análogamente para el segundo sistema se tiene que ambas colas están vacías, es decir, existe un valor t^* tal que en el intervalo $(0, t^*)$ no ha llegado ningún usuario, es decir,

$$L_i(t^*) = 0$$

para $i = 1, 2, 3, 4$.

37.2.4. Resultados para Procesos de Salida

37.2.5. Procesos Regenerativos

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Definición 37.2.45 *Para el proceso $\{(N(t), X(t)) : t \geq 0\}$, sus trayectoria muestrales en el intervalo de tiempo $[T_{n-1}, T_n)$ están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1} + t) : 0 \leq t < \xi_n\})$$

Este ζ_n es el n-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos T_n si sus segmentos ζ_n son independientes e idénticamennte distribuidos.

Observación 37.2.1 *Si $\tilde{X}(t)$ con espacio de estados $\tilde{S}$ es regenerativo sobre T_n, entonces $X(t) = f\left(\tilde{X}(t)\right)$ también es regenerativo sobre T_n, para cualquier función $f : \tilde{S} \to S$.*

Observación 37.2.2 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Definición 37.2.46 (Definición Clásica) *Un proceso estocástico $X = \{X(t) : t \geq 0\}$ es llamado regenerativo is existe una variable aleatoria $R_1 > 0$ tal que*

i) $\{X(t + R_1) : t \geq 0\}$ *es independiente de* $\{\{X(t) : t < R_1\},\}$

ii) $\{X(t + R_1) : t \geq 0\}$ *es estocásticamente equivalente a* $\{X(t) : t > 0\}$

Llamamos a R_1 tiempo de regeneración, y decimos que X se regenera en este punto.

$\{X(t + R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Nota 37.2.36 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Definición 37.2.47 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty X(u)\,du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty I_x(u)\,du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\,dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.2.37 *a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.*

b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

37.2.6. Renewal and Regenerative Processes: Serfozo[35]

Definición 37.2.48 *Sean $0 \leq T_1 \leq T_2 \leq \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0,t)$ es*

$$N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t), \tag{37.2.44}$$

para $t \geq 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.2.49 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \geq 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0,t)$*

Nota 37.2.38 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^n \xi_k$ y $N(t) = \sum_{n=1}^\infty \mathbb{1}(T_n \leq t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes Números.*

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq \quad t &< T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.2.23 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Nota 37.2.39 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.2.30 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{37.2.45}$$

$$lim_{t\to\infty} t^{-1} N(t) = 1/\mu, \ c.s. \tag{37.2.46}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.2.18 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1} N(t) \to 1/\mu, \ c.s. \ cuando \ t \to \infty. \tag{37.2.47}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.2.50 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.2.31 *Supóngase que $n^{-1} T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \ c.s. \tag{37.2.48}$$

$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \ c.s. \tag{37.2.49}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.2.19 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \ c.s. \ cuando \ t \to \infty. \tag{37.2.50}$$

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.2.51 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t) = \sum_{n=1}^{\infty} F^{n\star}(t), \ t \geq 0,$$

donde $F^{0\star}(t) = \mathbb{1}(t \geq 0)$.

Proposición 37.2.24 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t > 0$, y es $U'(t) = \sum_{n=0}^{\infty} f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t) > N(t-)\} = 0, \ t \geq 0.$$

Definición 37.2.52 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha) = \int_{\mathbb{R}_+} e^{-\alpha t} dF(t), \ \alpha \geq 0.$$

Entonces

$$\hat{U}(\alpha) = \sum_{n=0}^{\infty} F^{\hat{n}\star}(\alpha) = \sum_{n=0}^{\infty} \hat{F}(\alpha)^n = \frac{1}{1-\hat{F}(\alpha)}.$$

Proposición 37.2.25 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha) = \frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.2.40 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)] = \lambda t$, para $t \geq 0$.*

Teorema 37.2.32 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t) = \mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f : \mathbb{R}_+ \to \mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()} f(T_n)\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista. Además si $X_1, X_2, \ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n | T_n = s] = f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)} X_n\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista.

Corolario 37.2.20 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right] = \mu \mathbb{E}[N(t)+1], \ t \geq 0,$$

Definición 37.2.53 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t < 0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t) = h(t) + \int_{[0,t]} H(t-s)\, dF(s), \ t \geq 0, \tag{37.2.51}$$

donde $H(t)$ es una función de valores reales. Esto es $H = h + F \star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t < 0$.

Proposición 37.2.26 *La función $U \star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.2.33 (Teorema Renovación Elemental)

$$t^{-1} U(t) \to 1/\mu, \text{ cuando } t \to \infty.$$

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.2.54 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t) = \sum_{n=1}^{\infty} F^{n\star}(t), \ t \geq 0,$$

donde $F^{0\star}(t) = \mathbb{1}(t \geq 0)$.

Proposición 37.2.27 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t > 0$, y es $U'(t) = \sum_{n=0}^{\infty} f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t) > N(t-)\} = 0, \ t \geq 0.$$

Definición 37.2.55 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha) = \int_{\mathbb{R}_+} e^{-\alpha t} dF(t), \ \alpha \geq 0.$$

Entonces

$$\hat{U}(\alpha) = \sum_{n=0}^{\infty} F^{\hat{n}\star}(\alpha) = \sum_{n=0}^{\infty} \hat{F}(\alpha)^n = \frac{1}{1-\hat{F}(\alpha)}.$$

Proposición 37.2.28 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha) = \frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.2.41 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)] = \lambda t$, para $t \geq 0$.*

Teorema 37.2.34 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t) = \mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f : \mathbb{R}_+ \to \mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()} f(T_n)\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista. Además si $X_1, X_2, \ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n | T_n = s] = f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)} X_n\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista.

Corolario 37.2.21 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right] = \mu \mathbb{E}[N(t)+1], \ t \geq 0,$$

Definición 37.2.56 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t < 0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t) = h(t) + \int_{[0,t]} H(t-s)\, dF(s), \ t \geq 0, \tag{37.2.52}$$

donde $H(t)$ es una función de valores reales. Esto es $H = h + F \star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t < 0$.

Proposición 37.2.29 *La función $U \star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.2.35 (Teorema Renovación Elemental)

$$t^{-1} U(t) \to 1/\mu, \text{ cuando } t \to \infty.$$

Nota 37.2.42 *Una función $h : \mathbb{R}_+ \to \mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ es decreciente y Riemann Integrable.

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)| \leq b(t)$, donde b es DRI.

Teorema 37.2.36 (Teorema Principal de Renovación) *Si F es no aritmética y $h(t)$ es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty} U \star h = \frac{1}{\mu} \int_{\mathbb{R}_+} h(s)\, ds.$$

Proposición 37.2.30 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t < 0$ puede expresarse como*

$$H(t) = U \star h(t), \text{ donde } h(t) = H(t) - F \star H(t)$$

Definición 37.2.57 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}[X(T+t)|T] = \mathbb{E}[X(t)], \text{ para } t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.2.31 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}[X(t)] = U \star h(t), \text{ donde } h(t) = \mathbb{E}[X(t) \mathbb{1}(T > t)].$$

Teorema 37.2.37 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M = \sup\{|X(t)| : t \leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}[X(t)] = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds,$$

donde $h(t) = \mathbb{E}[X(t) \mathbb{1}(T > t)]$.

Nota 37.2.43 *Una función $h : \mathbb{R}_+ \to \mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ es decreciente y Riemann Integrable.

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)| \leq b(t)$, donde b es DRI.

Teorema 37.2.38 (Teorema Principal de Renovación) *Si F es no aritmética y $h(t)$ es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty}U \star h = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds.$$

Proposición 37.2.32 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t < 0$ puede expresarse como*

$$H(t) = U \star h(t), \text{ donde } h(t) = H(t) - F \star H(t)$$

Definición 37.2.58 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}[X(T+t)|T] = \mathbb{E}[X(t)], \text{ para } t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.2.33 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}[X(t)] = U \star h(t), \text{ donde } h(t) = \mathbb{E}[X(t) \mathbb{1}(T > t)].$$

Teorema 37.2.39 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M = \sup\{|X(t)| : t \leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}[X(t)] = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds,$$

donde $h(t) = \mathbb{E}[X(t) \mathbb{1}(T > t)]$.

37.2.7. Procesos Regenerativos

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Definición 37.2.59 *Para el proceso $\{(N(t), X(t)) : t \geq 0\}$, sus trayectoria muestrales en el intervalo de tiempo $[T_{n-1}, T_n)$ están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1} + t) : 0 \leq t < \xi_n\})$$

Este ζ_n es el n-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos T_n si sus segmentos ζ_n son independientes e idénticamennte distribuidos.

Observación 37.2.3 *Si $\tilde{X}(t)$ con espacio de estados $\tilde{S}$ es regenerativo sobre T_n, entonces $X(t) = f\left(\tilde{X}(t)\right)$ también es regenerativo sobre T_n, para cualquier función $f : \tilde{S} \to S$.*

Observación 37.2.4 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Definición 37.2.60 (Definición Clásica) *Un proceso estocástico $X = \{X(t) : t \geq 0\}$ es llamado regenerativo is existe una variable aleatoria $R_1 > 0$ tal que*

i) $\{X(t + R_1) : t \geq 0\}$ *es independiente de* $\{\{X(t) : t < R_1\},\}$

ii) $\{X(t + R_1) : t \geq 0\}$ *es estocásticamente equivalente a* $\{X(t) : t > 0\}$

Llamamos a R_1 tiempo de regeneración, y decimos que X se regenera en este punto.

$\{X(t + R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Nota 37.2.44 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Definición 37.2.61 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t} \int_0^\infty X(u)\, du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t} \int_0^\infty I_x(u)\, du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\, dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.2.45 *a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.*

b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

37.2.8. Procesos Regenerativos

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Definición 37.2.62 *Para el proceso $\{(N(t), X(t)) : t \geq 0\}$, sus trayectoria muestrales en el intervalo de tiempo $[T_{n-1}, T_n)$ están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1} + t) : 0 \leq t < \xi_n\})$$

Este ζ_n es el n-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos T_n si sus segmentos ζ_n son independientes e idénticamennte distribuidos.

Observación 37.2.5 *Si $\tilde{X}(t)$ con espacio de estados $\tilde{S}$ es regenerativo sobre T_n, entonces $X(t) = f\left(\tilde{X}(t)\right)$ también es regenerativo sobre T_n, para cualquier función $f : \tilde{S} \to S$.*

Observación 37.2.6 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Definición 37.2.63 (Definición Clásica) *Un proceso estocástico $X = \{X(t) : t \geq 0\}$ es llamado regenerativo is existe una variable aleatoria $R_1 > 0$ tal que*

i) $\{X(t + R_1) : t \geq 0\}$ *es independiente de* $\{\{X(t) : t < R_1\},\}$

ii) $\{X(t + R_1) : t \geq 0\}$ *es estocásticamente equivalente a* $\{X(t) : t > 0\}$

Llamamos a R_1 tiempo de regeneración, y decimos que X se regenera en este punto.

$\{X(t + R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Nota 37.2.46 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Definición 37.2.64 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t} \int_0^\infty X(u)\, du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t} \int_0^\infty I_x(u)\, du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\, dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.2.47 *a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.*

b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

37.2.9. Procesos Regenerativos Estacionarios - Stidham [41]

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\{V(t - s) \in A | X_1 > t - s\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones (*puntos de regeneración*) que ocurren en $[0, t]$. El intervalo $[0, X_1)$ es llamado *primer ciclo de regeneración* de $\{V(t), t \geq 0\}$, $[X_1, X_1 + X_2)$ el *segundo ciclo de regeneración*, y así sucesivamente.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 37.2.65 *Se define el proceso estacionario, $\{V^*(t), t \geq 0\}$, para $\{V(t), t \geq 0\}$ por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]} \int_0^\infty \mathbb{P}\{V(t + x) \in A | X > x\}(1 - F(x))\, dx,$$

para todo $t \geq 0$ y todo conjunto de Borel A.

Definición 37.2.66 *Una distribución se dice que es* aritmética *si todos sus puntos de incremento son múltiplos de la forma $0, \lambda, 2\lambda, \ldots$ para alguna $\lambda > 0$ entera.*

Definición 37.2.67 *Una modificación medible de un proceso $\{V(t), t \geq 0\}$, es una versión de este, $\{V(t, w)\}$ conjuntamente medible para $t \geq 0$ y para $w \in S$, S espacio de estados para $\{V(t), t \geq 0\}$.*

Teorema 37.2.40 *Sea $\{V(t), t \geq\}$ un proceso regenerativo no negativo con modificación medible. Sea $\mathbb{E}[X] < \infty$. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de t, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$, equivalentemente, si $\mathbb{E}\left[\int_0^X V(s)\,ds\right] < \infty$,entonces

$$\frac{\int_0^t V(s)\,ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$.

37.2.10. Procesos Regenerativos Estacionarios - Stidham [41]

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\left\{V(t-s) \in A | X_1 > t - s\right\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones (*puntos de regeneración*) que ocurren en $[0, t]$. El intervalo $[0, X_1)$ es llamado *primer ciclo de regeneración* de $\{V(t), t \geq 0\}$, $[X_1, X_1 + X_2)$ el *segundo ciclo de regeneración*, y así sucesivamente.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 37.2.68 *Se define el proceso estacionario, $\{V^*(t), t \geq 0\}$, para $\{V(t), t \geq 0\}$ por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]} \int_0^\infty \mathbb{P}\{V(t+x) \in A | X > x\}(1 - F(x))\,dx,$$

para todo $t \geq 0$ y todo conjunto de Borel A.

Definición 37.2.69 *Una distribución se dice que es* aritmética *si todos sus puntos de incremento son múltiplos de la forma $0, \lambda, 2\lambda, \ldots$ para alguna $\lambda > 0$ entera.*

Definición 37.2.70 *Una modificación medible de un proceso $\{V(t), t \geq 0\}$, es una versión de este, $\{V(t, w)\}$ conjuntamente medible para $t \geq 0$ y para $w \in S$, S espacio de estados para $\{V(t), t \geq 0\}$.*

Teorema 37.2.41 *Sea $\{V(t), t \geq\}$ un proceso regenerativo no negativo con modificación medible. Sea $\mathbb{E}[X] < \infty$. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de t, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$, equivalentemente, si $\mathbb{E}\left[\int_0^X V(s)\,ds\right] < \infty$,entonces

$$\frac{\int_0^t V(s)\,ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$.

37.2.11. Propiedades de los Procesos de Renovación

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq & \quad t \quad < T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.2.34 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Nota 37.2.48 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.2.42 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{37.2.53}$$

$$lim_{t\to\infty} t^{-1} N(t) = 1/\mu, \ c.s. \tag{37.2.54}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.2.22 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1} N(t) \to 1/\mu, \ c.s. \ cuando \ t \to \infty. \tag{37.2.55}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.2.71 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.2.43 *Supóngase que $n^{-1} T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \ c.s. \tag{37.2.56}$$

$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \ c.s. \tag{37.2.57}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.2.23 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \ c.s. \ cuando \ t \to \infty. \tag{37.2.58}$$

37.2.12. Propiedades de los Procesos de Renovación

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq & \quad t \quad < T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.2.35 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Nota 37.2.49 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.2.44 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{37.2.59}$$

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.2.36 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Nota 37.2.50 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.2.46 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{37.2.65}$$

$$lim_{t\to\infty} t^{-1} N(t) = 1/\mu, \ c.s. \tag{37.2.66}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.2.26 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1} N(t) \to 1/\mu, \ c.s. \ cuando \ t \to \infty. \tag{37.2.67}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.2.73 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.2.47 *Supóngase que $n^{-1} T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \ c.s. \tag{37.2.68}$$

$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \ c.s. \tag{37.2.69}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.2.27 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \ c.s. \ cuando \ t \to \infty. \tag{37.2.70}$$

37.2.14. Propiedades de los Procesos de Renovación

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq & \quad t \quad < T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.2.37 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Nota 37.2.51 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.2.48 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{37.2.71}$$

$$lim_{t\to\infty} t^{-1} N(t) = 1/\mu, \ c.s. \tag{37.2.72}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.2.28 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1} N(t) \to 1/\mu, \ c.s. \ cuando \ t \to \infty. \tag{37.2.73}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.2.74 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.2.49 *Supóngase que $n^{-1} T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \ c.s. \tag{37.2.74}$$

$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \ c.s. \tag{37.2.75}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.2.29 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \ c.s. \ cuando \ t \to \infty. \tag{37.2.76}$$

37.2.15. Procesos Regenerativos Estacionarios - Stidham [41]

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\left\{V(t-s) \in A | X_1 > t - s\right\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones (*puntos de regeneración*) que ocurren en $[0, t]$. El intervalo $[0, X_1)$ es llamado *primer ciclo de regeneración* de $\{V(t), t \geq 0\}$, $[X_1, X_1 + X_2)$ el *segundo ciclo de regeneración*, y así sucesivamente.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 37.2.75 *Se define el proceso estacionario, $\{V^*(t), t \geq 0\}$, para $\{V(t), t \geq 0\}$ por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]} \int_0^\infty \mathbb{P}\{V(t+x) \in A | X > x\}(1 - F(x))\, dx,$$

para todo $t \geq 0$ y todo conjunto de Borel A.

Definición 37.2.76 *Una distribución se dice que es* aritmética *si todos sus puntos de incremento son múltiplos de la forma $0, \lambda, 2\lambda, \ldots$ para alguna $\lambda > 0$ entera.*

Definición 37.2.77 *Una modificación medible de un proceso $\{V(t), t \geq 0\}$, es una versión de este, $\{V(t, w)\}$ conjuntamente medible para $t \geq 0$ y para $w \in S$, S espacio de estados para $\{V(t), t \geq 0\}$.*

Teorema 37.2.50 *Sea $\{V(t), t \geq\}$ un proceso regenerativo no negativo con modificación medible. Sea $\mathbb{E}[X] < \infty$. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de t, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\, ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$, equivalentemente, si $\mathbb{E}\left[\int_0^X V(s)\, ds\right] < \infty$,entonces

$$\frac{\int_0^t V(s)\, ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\, ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$.

37.2.16. Procesos de Renovación

Definición 37.2.78 *Sean $0 \leq T_1 \leq T_2 \leq \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0, t)$ es*

$$N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t), \tag{37.2.77}$$

para $t \geq 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.2.79 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \geq 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0, t)$*

Nota 37.2.52 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^n \xi_k$ y $N(t) = \sum_{n=1}^\infty \mathbb{1}(T_n \leq t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes NÃºmeros.*

37.2.17. Teorema Principal de Renovación

Nota 37.2.53 *Una función $h : \mathbb{R}_+ \to \mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ es decreciente y Riemann Integrable.

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)| \leq b(t)$, donde b es DRI.

Teorema 37.2.51 (Teorema Principal de Renovación) *Si F es no aritmética y $h(t)$ es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty} U \star h = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\, ds.$$

Proposición 37.2.38 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t < 0$ puede expresarse como*

$$H(t) = U \star h(t)\,,\ \textit{donde}\ h(t) = H(t) - F \star H(t)$$

Definición 37.2.80 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}[X(T+t)|T] = \mathbb{E}[X(t)]\,,\ \textit{para}\ t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.2.39 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}[X(t)] = U \star h(t)\,,\ \textit{donde}\ h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T > t)]\,.$$

Teorema 37.2.52 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M = \sup\{|X(t)| : t \leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}[X(t)] = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\, ds,$$

donde $h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T > t)]$.

37.2.18. Función de Renovación

Definición 37.2.81 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t < 0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t) = h(t) + \int_{[0,t]} H(t-s)\, dF(s)\,,\ t \geq 0, \tag{37.2.78}$$

donde $H(t)$ es una función de valores reales. Esto es $H = h + F \star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t < 0$.

Proposición 37.2.40 *La función $U \star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.2.53 (Teorema Renovación Elemental)

$$t^{-1}U(t) \to 1/\mu,\ \textit{cuando}\ t \to \infty.$$

37.2.19. Propiedades de los Procesos de Renovación

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq &\quad t \quad < T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.2.41 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Nota 37.2.54 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.2.54 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{37.2.79}$$

$$lim_{t\to\infty} t^{-1} N(t) = 1/\mu, \ c.s. \tag{37.2.80}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.2.30 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1} N(t) \to 1/\mu, \ c.s. \ cuando \ t \to \infty. \tag{37.2.81}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.2.82 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.2.55 *Supóngase que $n^{-1} T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \ c.s. \tag{37.2.82}$$

$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \ c.s. \tag{37.2.83}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.2.31 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \ c.s. \ cuando \ t \to \infty. \tag{37.2.84}$$

37.2.20. Función de Renovación

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.2.83 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t) = \sum_{n=1}^{\infty} F^{n\star}(t), \ t \geq 0,$$

donde $F^{0\star}(t) = \mathbb{1}(t \geq 0)$.

Proposición 37.2.42 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t > 0$, y es $U'(t) = \sum_{n=0}^{\infty} f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t) > N(t-)\} = 0, \ t \geq 0.$$

Definición 37.2.84 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha) = \int_{\mathbb{R}_+} e^{-\alpha t} dF(t), \ \alpha \geq 0.$$

Entonces

$$\hat{U}(\alpha) = \sum_{n=0}^{\infty} F^{\hat{n}\star}(\alpha) = \sum_{n=0}^{\infty} \hat{F}(\alpha)^n = \frac{1}{1-\hat{F}(\alpha)}.$$

Proposición 37.2.43 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha) = \frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.2.55 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)] = \lambda t$, para $t \geq 0$.*

Teorema 37.2.56 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t) = \mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f : \mathbb{R}_+ \to \mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()} f(T_n)\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista. Además si $X_1, X_2, \ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n | T_n = s] = f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)} X_n\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista.

Corolario 37.2.32 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right] = \mu \mathbb{E}[N(t)+1], \ t \geq 0,$$

37.2.21. Procesos de Renovación

Definición 37.2.85 *Sean $0 \leq T_1 \leq T_2 \leq \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0, t)$ es*

$$N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t), \tag{37.2.85}$$

para $t \geq 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.2.86 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \geq 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0, t)$*

Nota 37.2.56 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^{n} \xi_k$ y $N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes NÃºmeros.*

37.2.22. Puntos de Renovación

Para cada cola Q_i se tienen los procesos de arribo a la cola, para estas, los tiempos de arribo están dados por

$$\left\{T_1^i, T_2^i, \ldots, T_k^i, \ldots\right\},$$

entonces, consideremos solamente los primeros tiempos de arribo a cada una de las colas, es decir,

$$\left\{T_1^1, T_1^2, T_1^3, T_1^4\right\},$$

se sabe que cada uno de estos tiempos se distribuye de manera exponencial con parámetro $1/mu_i$. Además se sabe que para

$$T^* = \text{mín}\left\{T_1^1, T_1^2, T_1^3, T_1^4\right\},$$

T^* se distribuye de manera exponencial con parámetro

$$\mu^* = \sum_{i=1}^{4} \mu_i.$$

Ahora, dado que

$$\tilde{r} = r_1 + r_2 \quad \text{y} \quad \hat{r} = r_3 + r_4.$$

Supongamos que

$$\tilde{r}, \hat{r} < \mu^*,$$

entonces si tomamos

$$r^* = \text{mín}\left\{\tilde{r}, \hat{r}\right\},$$

se tiene que para

$$t^* \in (0, r^*)$$

se cumple que

$$\tau_1(1) = 0 \quad \text{y por tanto} \quad \overline{\tau}_1 = 0,$$

entonces para la segunda cola en este primer ciclo se cumple que

$$\tau_2 = \overline{\tau}_1 + r_1 = r_1 < \mu^*,$$

y por tanto se tiene que

$$\overline{\tau}_2 = \tau_2.$$

Por lo tanto, nuevamente para la primer cola en el segundo ciclo

$$\tau_1(2) = \tau_2(1) + r_2 = \tilde{r} < \mu^*.$$

Análogamente para el segundo sistema se tiene que ambas colas están vacías, es decir, existe un valor t^* tal que en el intervalo $(0, t^*)$ no ha llegado ningún usuario, es decir,

$$L_i(t^*) = 0$$

para $i = 1, 2, 3, 4$.

37.2.23. Resultados para Procesos de Salida

En [40] prueban que para la existencia de un una sucesión infinita no decreciente de tiempos de regeneración $\tau_1 \leq \tau_2 \leq \cdots$ en los cuales el proceso se regenera, basta un tiempo de regeneración R_1, donde $R_j = \tau_j - \tau_{j-1}$. Para tal efecto se requiere la existencia de un espacio de probabilidad $(\Omega, \mathcal{F}, \mathbb{P})$, y proceso estocástico $X = \{X(t) : t \geq 0\}$ con espacio de estados $(S, \mathcal{R})$, con $\mathcal{R}$ σ-álgebra.

Proposición 37.2.44 *Si existe una variable aleatoria no negativa R_1 tal que $\theta_{R1}X =_D X$, entonces $(\Omega, \mathcal{F}, \mathbb{P})$ puede extenderse para soportar una sucesión estacionaria de variables aleatorias $R = \{R_k : k \geq 1\}$, tal que para $k \geq 1$,*

$$\theta_k (X, R) =_D (X, R).$$

Además, para $k \geq 1$, $\theta_k R$ es condicionalmente independiente de $(X, R_1, \ldots, R_k)$, dado $\theta_{\tau k} X$.

- Doob en 1953 demostró que el estado estacionario de un proceso de partida en un sistema de espera $M/G/\infty$, es Poisson con la misma tasa que el proceso de arribos.
- Burke en 1968, fue el primero en demostrar que el estado estacionario de un proceso de salida de una cola $M/M/s$ es un proceso Poisson.
- Disney en 1973 obtuvo el siguiente resultado:

  Teorema 37.2.57 *Para el sistema de espera $M/G/1/L$ con disciplina FIFO, el proceso $\boldsymbol{I}$ es un proceso de renovación si y sólo si el proceso denominado longitud de la cola es estacionario y se cumple cualquiera de los siguientes casos:*

  a) Los tiempos de servicio son identicamente cero;
  b) $L = 0$, para cualquier proceso de servicio S;
  c) $L = 1$ y $G = D$;
  d) $L = \infty$ y $G = M$.

  En estos casos, respectivamente, las distribuciones de interpartida $P\{T_{n+1} - T_n \leq t\}$ son

  a) $1 - e^{-\lambda t}$, $t \geq 0$;
  b) $1 - e^{-\lambda t} * F(t)$, $t \geq 0$;
  c) $1 - e^{-\lambda t} * \mathbb{1}_d(t)$, $t \geq 0$;
  d) $1 - e^{-\lambda t} * F(t)$, $t \geq 0$.

- Finch (1959) mostró que para los sistemas $M/G/1/L$, con $1 \leq L \leq \infty$ con distribuciones de servicio dos veces diferenciable, solamente el sistema $M/M/1/\infty$ tiene proceso de salida de renovación estacionario.
- King (1971) demostro que un sistema de colas estacionario $M/G/1/1$ tiene sus tiempos de interpartida sucesivas D_n y D_{n+1} son independientes, si y sólo si, $G = D$, en cuyo caso le proceso de salida es de renovación.
- Disney (1973) demostró que el único sistema estacionario $M/G/1/L$, que tiene proceso de salida de renovación son los sistemas $M/M/1$ y $M/D/1/1$.
- El siguiente resultado es de Disney y Koning (1985)

  Teorema 37.2.58 *En un sistema de espera $M/G/s$, el estado estacionario del proceso de salida es un proceso Poisson para cualquier distribución de los tiempos de servicio si el sistema tiene cualquiera de las siguientes cuatro propiedades.*

  a) $s = \infty$
  b) La disciplina de servicio es de procesador compartido.
  c) La disciplina de servicio es LCFS y preemptive resume, esto se cumple para $L < \infty$
  d) $G = M$.

- El siguiente resultado es de Alamatsaz (1983)

  Teorema 37.2.59 *En cualquier sistema de colas $GI/G/1/L$ con $1 \leq L < \infty$ y distribución de interarribos A y distribución de los tiempos de servicio B, tal que $A(0) = 0$, $A(t)(1 - B(t)) > 0$ para alguna $t > 0$ y $B(t)$ para toda $t > 0$, es imposible que el proceso de salida estacionario sea de renovación.*

Estos resultados aparecen en Daley (1968) [13] para $\{T_n\}$ intervalos de inter-arribo, $\{D_n\}$ intervalos de inter-salida y $\{S_n\}$ tiempos de servicio.

- Si el proceso $\{T_n\}$ es Poisson, el proceso $\{D_n\}$ es no correlacionado si y sólo si es un proceso Poisso, lo cual ocurre si y sólo si $\{S_n\}$ son exponenciales negativas.
- Si $\{S_n\}$ son exponenciales negativas, $\{D_n\}$ es un proceso de renovación si y sólo si es un proceso Poisson, lo cual ocurre si y sólo si $\{T_n\}$ es un proceso Poisson.
- $\mathbb{E}(D_n) = \mathbb{E}(T_n)$.
- Para un sistema de visitas $GI/M/1$ se tiene el siguiente teorema:

  Teorema 37.2.60 *En un sistema estacionario $GI/M/1$ los intervalos de interpartida tienen*

$$\begin{aligned}
\mathbb{E}\left(e^{-\theta D_n}\right) &= \mu(\mu+\theta)^{-1}\left[\delta\theta - \mu(1-\delta)\alpha(\theta)\right]\left[\theta - \mu(1-\delta)^{-1}\right] \\
\alpha(\theta) &= \mathbb{E}\left[e^{-\theta T_0}\right] \\
var(D_n) &= var(T_0) - \left(\tau^{-1} - \delta^{-1}\right) 2\delta\left(\mathbb{E}(S_0)\right)^2 (1-\delta)^{-1}.
\end{aligned}$$

  Teorema 37.2.61 *El proceso de salida de un sistema de colas estacionario $GI/M/1$ es un proceso de renovación si y sólo si el proceso de entrada es un proceso Poisson, en cuyo caso el proceso de salida es un proceso Poisson.*

  Teorema 37.2.62 *Los intervalos de interpartida $\{D_n\}$ de un sistema $M/G/1$ estacionario son no correlacionados si y sólo si la distribución de los tiempos de servicio es exponencial negativa, es decir, el sistema es de tipo $M/M/1$.*

37.2.24. Procesos Regenerativos

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Definición 37.2.87 *Para el proceso $\{(N(t), X(t)) : t \geq 0\}$, sus trayectoria muestrales en el intervalo de tiempo $[T_{n-1}, T_n)$ están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1} + t) : 0 \leq t < \xi_n\})$$

Este ζ_n es el n-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos T_n si sus segmentos ζ_n son independientes e idénticamennte distribuidos.

Observación 37.2.7 *Si $\tilde{X}(t)$ con espacio de estados $\tilde{S}$ es regenerativo sobre T_n, entonces $X(t) = f\left(\tilde{X}(t)\right)$ también es regenerativo sobre T_n, para cualquier función $f : \tilde{S} \to S$.*

Observación 37.2.8 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Definición 37.2.88 (Definición Clásica) *Un proceso estocástico $X = \{X(t) : t \geq 0\}$ es llamado regenerativo is existe una variable aleatoria $R_1 > 0$ tal que*

i) $\{X(t + R_1) : t \geq 0\}$ *es independiente de* $\{\{X(t) : t < R_1\},\}$

ii) $\{X(t + R_1) : t \geq 0\}$ *es estocásticamente equivalente a* $\{X(t) : t > 0\}$

Llamamos a R_1 tiempo de regeneración, y decimos que X se regenera en este punto.

$\{X(t + R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Nota 37.2.57 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Definición 37.2.89 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t} \int_0^\infty X(u)\, du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t} \int_0^\infty I_x(u)\, du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\, dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.2.58 *a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.*

b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

37.2.25. Renewal and Regenerative Processes: Serfozo[35]

Definición 37.2.90 *Sean $0 \leq T_1 \leq T_2 \leq \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0,t)$ es*

$$N(t) = \sum_{n=1}^{\infty} 1\!\!1 (T_n \leq t), \tag{37.2.86}$$

para $t \geq 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.2.91 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \geq 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0,t)$*

Nota 37.2.59 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^{n} \xi_k$ y $N(t) = \sum_{n=1}^{\infty} 1\!\!1 (T_n \leq t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes Números.*

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq \quad t &< T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.2.45 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Nota 37.2.60 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.2.63 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{37.2.87}$$

$$lim_{t\to\infty} t^{-1} N(t) = 1/\mu, \ c.s. \tag{37.2.88}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.2.33 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1}N(t) \to 1/\mu, \text{ c.s. cuando } t \to \infty. \tag{37.2.89}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.2.92 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.2.64 *Supóngase que $n^{-1}T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1}Z(T_n) = a, \text{ c.s.} \tag{37.2.90}$$

$$lim_{t\to\infty} t^{-1}Z(t) = a/\mu, \text{ c.s.} \tag{37.2.91}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1}M_n = 0$ c.s.

Corolario 37.2.34 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1}Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \text{ c.s. cuando } t \to \infty. \tag{37.2.92}$$

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.2.93 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t) = \sum_{n=1}^{\infty} F^{n\star}(t), \ t \geq 0,$$

donde $F^{0\star}(t) = \mathbb{1}(t \geq 0)$.

Proposición 37.2.46 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t > 0$, y es $U'(t) = \sum_{n=0}^{\infty} f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t) > N(t-)\} = 0, \ t \geq 0.$$

Definición 37.2.94 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha) = \int_{\mathbb{R}_+} e^{-\alpha t} dF(t), \ \alpha \geq 0.$$

Entonces

$$\hat{U}(\alpha) = \sum_{n=0}^{\infty} F^{\hat{n}\star}(\alpha) = \sum_{n=0}^{\infty} \hat{F}(\alpha)^n = \frac{1}{1 - \hat{F}(\alpha)}.$$

Proposición 37.2.47 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha) = \frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.2.61 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)] = \lambda t$, para $t \geq 0$.*

Teorema 37.2.65 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t) = \mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f : \mathbb{R}_+ \to \mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()} f(T_n)\right] = \int_{(0,t]} f(s)\, d\eta(s)\,,\ t \geq 0,$$

suponiendo que la integral exista. Además si $X_1, X_2, \ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n | T_n = s] = f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)} X_n\right] = \int_{(0,t]} f(s)\, d\eta(s)\,,\ t \geq 0,$$

suponiendo que la integral exista.

Corolario 37.2.35 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right] = \mu \mathbb{E}[N(t)+1]\,,\ t \geq 0,$$

Definición 37.2.95 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t < 0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t) = h(t) + \int_{[0,t]} H(t-s)\, dF(s)\,,\ t \geq 0, \tag{37.2.93}$$

donde $H(t)$ es una función de valores reales. Esto es $H = h + F \star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t < 0$.

Proposición 37.2.48 *La función $U \star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.2.66 (Teorema Renovación Elemental)

$$t^{-1} U(t) \to 1/\mu, \text{ cuando } t \to \infty.$$

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.2.96 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t) = \sum_{n=1}^{\infty} F^{n\star}(t)\,,\ t \geq 0,$$

donde $F^{0\star}(t) = \mathbb{1}(t \geq 0)$.

Proposición 37.2.49 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t > 0$, y es $U'(t) = \sum_{n=0}^{\infty} f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t) > N(t-)\} = 0,\ t \geq 0.$$

Definición 37.2.97 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha) = \int_{\mathbb{R}_+} e^{-\alpha t} dF(t)\,,\ \alpha \geq 0.$$

Entonces

$$\hat{U}(\alpha) = \sum_{n=0}^{\infty} F^{\hat{n}\star}(\alpha) = \sum_{n=0}^{\infty} \hat{F}(\alpha)^n = \frac{1}{1-\hat{F}(\alpha)}.$$

Proposición 37.2.50 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha) = \frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.2.62 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)] = \lambda t$, para $t \geq 0$.*

Teorema 37.2.67 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t) = \mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f : \mathbb{R}_+ \to \mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()} f(T_n)\right] = \int_{(0,t]} f(s)\, d\eta(s)\,,\ t \geq 0,$$

suponiendo que la integral exista. Además si $X_1, X_2, \ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n | T_n = s] = f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)} X_n\right] = \int_{(0,t]} f(s)\, d\eta(s)\,,\ t \geq 0,$$

suponiendo que la integral exista.

Corolario 37.2.36 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right] = \mu \mathbb{E}[N(t)+1]\,,\ t \geq 0,$$

Definición 37.2.98 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t < 0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t) = h(t) + \int_{[0,t]} H(t-s)\, dF(s)\,,\ t \geq 0, \tag{37.2.94}$$

donde $H(t)$ es una función de valores reales. Esto es $H = h + F \star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t < 0$.

Proposición 37.2.51 *La función $U \star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.2.68 (Teorema Renovación Elemental)

$$t^{-1} U(t) \to 1/\mu, \text{ cuando } t \to \infty.$$

Nota 37.2.63 *Una función $h : \mathbb{R}_+ \to \mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ es decreciente y Riemann Integrable.

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)| \leq b(t)$, donde b es DRI.

Teorema 37.2.69 (Teorema Principal de Renovación) *Si F es no aritmética y $h(t)$ es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty} U \star h = \frac{1}{\mu} \int_{\mathbb{R}_+} h(s)\, ds.$$

Proposición 37.2.52 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t < 0$ puede expresarse como*

$$H(t) = U \star h(t)\,,\ \text{donde } h(t) = H(t) - F \star H(t)$$

Definición 37.2.99 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}[X(T+t)|T] = \mathbb{E}[X(t)]\,,\ \text{para } t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.2.53 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}[X(t)] = U \star h(t)\,,\ \text{donde } h(t) = \mathbb{E}[X(t)\, \mathbb{1}(T > t)]\,.$$

Teorema 37.2.70 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M = \sup\{|X(t)| : t \leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty} \mathbb{E}[X(t)] = \frac{1}{\mu} \int_{\mathbb{R}_+} h(s)\, ds,$$

donde $h(t) = \mathbb{E}[X(t)\, \mathbb{1}(T > t)]$.

Nota 37.2.64 *Una función $h : \mathbb{R}_+ \to \mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ *es decreciente y Riemann Integrable.*

b) h *es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y* $|h(t)| \leq b(t)$*, donde* b *es DRI.*

Teorema 37.2.71 (Teorema Principal de Renovación) *Si F es no aritmética y $h(t)$ es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty} U \star h = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\, ds.$$

Proposición 37.2.54 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t < 0$ puede expresarse como*

$$H(t) = U \star h(t)\,,\ \textit{donde}\ h(t) = H(t) - F \star H(t)$$

Definición 37.2.100 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}[X(T+t)|T] = \mathbb{E}[X(t)]\,,\ \textit{para}\ t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.2.55 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}[X(t)] = U \star h(t)\,,\ \textit{donde}\ h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T > t)]\,.$$

Teorema 37.2.72 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M = \sup\{|X(t)| : t \leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}[X(t)] = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\, ds,$$

donde $h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T > t)]$.

37.2.26. Procesos Regenerativos

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Definición 37.2.101 *Para el proceso $\{(N(t), X(t)) : t \geq 0\}$, sus trayectoria muestrales en el intervalo de tiempo $[T_{n-1}, T_n)$ están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1} + t) : 0 \leq t < \xi_n\})$$

Este ζ_n es el n-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos T_n si sus segmentos ζ_n son independientes e idénticamennte distribuidos.

Observación 37.2.9 *Si $\tilde{X}(t)$ con espacio de estados $\tilde{S}$ es regenerativo sobre T_n, entonces $X(t) = f\left(\tilde{X}(t)\right)$ también es regenerativo sobre T_n, para cualquier función $f : \tilde{S} \to S$.*

Observación 37.2.10 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Definición 37.2.102 (Definición Clásica) *Un proceso estocástico $X = \{X(t) : t \geq 0\}$ es llamado regenerativo is existe una variable aleatoria $R_1 > 0$ tal que*

i) $\{X(t + R_1) : t \geq 0\}$ *es independiente de* $\{\{X(t) : t < R_1\},\}$

ii) $\{X(t + R_1) : t \geq 0\}$ *es estocásticamente equivalente a* $\{X(t) : t > 0\}$

Llamamos a R_1 tiempo de regeneración, y decimos que X se regenera en este punto.

$\{X(t + R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Nota 37.2.65 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Definición 37.2.103 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty X(u)\,du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty I_x(u)\,du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\,dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.2.66 *a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.*

b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

37.2.27. Procesos Regenerativos

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Definición 37.2.104 *Para el proceso $\{(N(t), X(t)) : t \geq 0\}$, sus trayectoria muestrales en el intervalo de tiempo $[T_{n-1}, T_n)$ están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1} + t) : 0 \leq t < \xi_n\})$$

Este ζ_n es el n-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos T_n si sus segmentos ζ_n son independientes e idénticamennte distribuidos.

Observación 37.2.11 *Si $\tilde{X}(t)$ con espacio de estados $\tilde{S}$ es regenerativo sobre T_n, entonces $X(t) = f\left(\tilde{X}(t)\right)$ también es regenerativo sobre T_n, para cualquier función $f : \tilde{S} \to S$.*

Observación 37.2.12 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Definición 37.2.105 (Definición Clásica) *Un proceso estocástico $X = \{X(t) : t \geq 0\}$ es llamado regenerativo is existe una variable aleatoria $R_1 > 0$ tal que*

i) $\{X(t + R_1) : t \geq 0\}$ es independiente de $\{\{X(t) : t < R_1\},\}$

ii) $\{X(t + R_1) : t \geq 0\}$ es estocásticamente equivalente a $\{X(t) : t > 0\}$

Llamamos a R_1 tiempo de regeneración, y decimos que X se regenera en este punto.

$\{X(t + R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Nota 37.2.67 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Definición 37.2.106 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty X(u)\,du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty I_x(u)\,du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\,dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.2.68 *a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.*

b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

37.2.28. Procesos Regenerativos Estacionarios - Stidham [41]

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\{V(t-s) \in A | X_1 > t - s\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones (*puntos de regeneración*) que ocurren en $[0, t]$. El intervalo $[0, X_1)$ es llamado *primer ciclo de regeneración* de $\{V(t), t \geq 0\}$, $[X_1, X_1 + X_2)$ el *segundo ciclo de regeneración*, y así sucesivamente.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 37.2.107 *Se define el proceso estacionario, $\{V^*(t), t \geq 0\}$, para $\{V(t), t \geq 0\}$ por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]} \int_0^\infty \mathbb{P}\{V(t+x) \in A | X > x\}(1 - F(x))\,dx,$$

para todo $t \geq 0$ y todo conjunto de Borel A.

Definición 37.2.108 *Una distribución se dice que es* aritmética *si todos sus puntos de incremento son múltiplos de la forma $0, \lambda, 2\lambda, \ldots$ para alguna $\lambda > 0$ entera.*

Definición 37.2.109 *Una modificación medible de un proceso $\{V(t), t \geq 0\}$, es una versión de este, $\{V(t, w)\}$ conjuntamente medible para $t \geq 0$ y para $w \in S$, S espacio de estados para $\{V(t), t \geq 0\}$.*

Teorema 37.2.73 *Sea $\{V(t), t \geq\}$ un proceso regenerativo no negativo con modificación medible. Sea $\mathbb{E}[X] < \infty$. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de t, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$, equivalentemente, si $\mathbb{E}\left[\int_0^X V(s)\,ds\right] < \infty$,entonces

$$\frac{\int_0^t V(s)\,ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$.

37.2.29. Procesos Regenerativos Estacionarios - Stidham [41]

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\left\{V(t-s) \in A | X_1 > t - s\right\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones (*puntos de regeneración*) que ocurren en $[0, t]$. El intervalo $[0, X_1)$ es llamado *primer ciclo de regeneración* de $\{V(t), t \geq 0\}$, $[X_1, X_1 + X_2)$ el *segundo ciclo de regeneración*, y así sucesivamente.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 37.2.110 *Se define el proceso estacionario, $\{V^*(t), t \geq 0\}$, para $\{V(t), t \geq 0\}$ por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]} \int_0^\infty \mathbb{P}\{V(t+x) \in A | X > x\}(1 - F(x))\, dx,$$

para todo $t \geq 0$ y todo conjunto de Borel A.

Definición 37.2.111 *Una distribución se dice que es* aritmética *si todos sus puntos de incremento son múltiplos de la forma $0, \lambda, 2\lambda, \ldots$ para alguna $\lambda > 0$ entera.*

Definición 37.2.112 *Una modificación medible de un proceso $\{V(t), t \geq 0\}$, es una versión de este, $\{V(t, w)\}$ conjuntamente medible para $t \geq 0$ y para $w \in S$, S espacio de estados para $\{V(t), t \geq 0\}$.*

Teorema 37.2.74 *Sea $\{V(t), t \geq\}$ un proceso regenerativo no negativo con modificación medible. Sea $\mathbb{E}[X] < \infty$. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de t, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\, ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$, equivalentemente, si $\mathbb{E}\left[\int_0^X V(s)\, ds\right] < \infty$,entonces

$$\frac{\int_0^t V(s)\, ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\, ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$.

37.2.30. Propiedades de los Procesos de Renovación

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq \quad t &< T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^\infty P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^\infty F^{n\star}(t)$$

Proposición 37.2.56 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}\left[N(t)^m\right] < \infty$, para $m \geq 1$.*

Nota 37.2.69 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.2.75 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{37.2.95}$$
$$lim_{t\to\infty} t^{-1} N(t) = 1/\mu, \ c.s. \tag{37.2.96}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.2.37 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1} N(t) \to 1/\mu, \ c.s. \ cuando \ t \to \infty. \tag{37.2.97}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.2.113 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.2.76 *Supóngase que $n^{-1} T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \ c.s. \tag{37.2.98}$$
$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \ c.s. \tag{37.2.99}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.2.38 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}\left[Z(T_1) - Z(T_0)\right]}{\mathbb{E}\left[T_1\right]}, \ c.s. \ cuando \ t \to \infty. \tag{37.2.100}$$

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq \ & t \ < T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}\left[N(t)\right] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}\left[N(t)\right] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.2.57 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}\left[N(t)^m\right] < \infty$, para $m \geq 1$.*

Nota 37.2.70 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.2.77 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{37.2.101}$$
$$lim_{t\to\infty} t^{-1} N(t) = 1/\mu, \ c.s. \tag{37.2.102}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.2.39 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1} N(t) \to 1/\mu, \ c.s. \ cuando \ t \to \infty. \tag{37.2.103}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.2.114 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.2.78 *Supóngase que $n^{-1} T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

Teorema 37.2.82 *Supóngase que $n^{-1} T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \ c.s. \tag{37.2.116}$$
$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \ c.s. \tag{37.2.117}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.2.44 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}\left[Z(T_1) - Z(T_0)\right]}{\mathbb{E}\left[T_1\right]}, \ c.s. \ cuando \ t \to \infty. \tag{37.2.118}$$

37.2.32. Procesos Regenerativos Estacionarios - Stidham [41]

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\left\{V(t-s) \in A | X_1 > t - s\right\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones (*puntos de regeneración*) que ocurren en $[0, t]$. El intervalo $[0, X_1)$ es llamado *primer ciclo de regeneración* de $\{V(t), t \geq 0\}$, $[X_1, X_1 + X_2)$ el *segundo ciclo de regeneración*, y así sucesivamente.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 37.2.117 *Se define el proceso estacionario, $\{V^*(t), t \geq 0\}$, para $\{V(t), t \geq 0\}$ por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]} \int_0^\infty \mathbb{P}\{V(t+x) \in A | X > x\} (1 - F(x))\, dx,$$

para todo $t \geq 0$ y todo conjunto de Borel A.

Definición 37.2.118 *Una distribución se dice que es* aritmética *si todos sus puntos de incremento son múltiplos de la forma $0, \lambda, 2\lambda, \ldots$ para alguna $\lambda > 0$ entera.*

Definición 37.2.119 *Una modificación medible de un proceso $\{V(t), t \geq 0\}$, es una versión de este, $\{V(t,w)\}$ conjuntamente medible para $t \geq 0$ y para $w \in S$, S espacio de estados para $\{V(t), t \geq 0\}$.*

Teorema 37.2.83 *Sea $\{V(t), t \geq\}$ un proceso regenerativo no negativo con modificación medible. Sea $\mathbb{E}[X] < \infty$. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de t, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$, equivalentemente, si $\mathbb{E}\left[\int_0^X V(s)\,ds\right] < \infty$,entonces

$$\frac{\int_0^t V(s)\,ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$.

37.2.33. Procesos de Renovación

Definición 37.2.120 *Sean $0 \leq T_1 \leq T_2 \leq \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0,t)$ es*

$$N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t), \tag{37.2.119}$$

para $t \geq 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.2.121 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \geq 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0,t)$*

Nota 37.2.73 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^{n} \xi_k$ y $N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes NÃºmeros.*

37.2.34. Teorema Principal de Renovación

Nota 37.2.74 *Una función $h : \mathbb{R}_+ \to \mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ es decreciente y Riemann Integrable.

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)| \leq b(t)$, donde b es DRI.

Teorema 37.2.84 (Teorema Principal de Renovación) *Si F es no aritmética y $h(t)$ es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty} U \star h = \frac{1}{\mu} \int_{\mathbb{R}_+} h(s)\,ds.$$

Proposición 37.2.60 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t < 0$ puede expresarse como*

$$H(t) = U \star h(t), \text{ donde } h(t) = H(t) - F \star H(t)$$

Definición 37.2.122 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}\left[X(T+t)\,|T\right] = \mathbb{E}\left[X(t)\right], \text{ para } t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.2.61 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}\left[X(t)\right] = U \star h(t), \text{ donde } h(t) = \mathbb{E}\left[X(t)\,\mathbb{1}(T > t)\right].$$

Teorema 37.2.85 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M = \sup\{|X(t)| : t \leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}\left[X(t)\right] = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds,$$

donde $h(t) = \mathbb{E}\left[X(t)\,\mathbb{1}(T > t)\right]$.

37.2.35. Función de Renovación

Definición 37.2.123 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t < 0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t) = h(t) + \int_{[0,t]} H(t-s)\,dF(s), \; t \geq 0, \tag{37.2.120}$$

donde $H(t)$ es una función de valores reales. Esto es $H = h + F \star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t < 0$.

Proposición 37.2.62 *La función $U \star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.2.86 (Teorema Renovación Elemental)

$$t^{-1}U(t) \to 1/\mu, \text{ cuando } t \to \infty.$$

37.2.36. Propiedades de los Procesos de Renovación

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq \quad t &< T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}\left[N(t)\right] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.2.63 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}\left[N(t)^m\right] < \infty$, para $m \geq 1$.*

Nota 37.2.75 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.2.87 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{37.2.121}$$
$$lim_{t\to\infty} t^{-1} N(t) = 1/\mu, \ c.s. \tag{37.2.122}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.2.45 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1} N(t) \to 1/\mu, \ c.s. \ cuando \ t \to \infty. \tag{37.2.123}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.2.124 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.2.88 *Supóngase que $n^{-1} T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \ c.s. \tag{37.2.124}$$
$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \ c.s. \tag{37.2.125}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.2.46 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}\left[Z(T_1) - Z(T_0)\right]}{\mathbb{E}\left[T_1\right]}, \ c.s. \ cuando \ t \to \infty. \tag{37.2.126}$$

37.2.37. Función de Renovación

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.2.125 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t) = \sum_{n=1}^{\infty} F^{n\star}(t), \ t \geq 0,$$

donde $F^{0\star}(t) = \mathbb{1}(t \geq 0)$.

Proposición 37.2.64 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t > 0$, y es $U'(t) = \sum_{n=0}^{\infty} f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t) > N(t-)\} = 0, \ t \geq 0.$$

Definición 37.2.126 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha) = \int_{\mathbb{R}_+} e^{-\alpha t} dF(t), \ \alpha \geq 0.$$

Entonces

$$\hat{U}(\alpha) = \sum_{n=0}^{\infty} F^{\hat{n}\star}(\alpha) = \sum_{n=0}^{\infty} \hat{F}(\alpha)^n = \frac{1}{1-\hat{F}(\alpha)}.$$

Proposición 37.2.65 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha) = \frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.2.76 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)] = \lambda t$, para $t \geq 0$.*

Teorema 37.2.89 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t) = \mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f : \mathbb{R}_+ \to \mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()} f(T_n)\right] = \int_{(0,t]} f(s)\, d\eta(s)\,,\ t \geq 0,$$

suponiendo que la integral exista. Además si $X_1, X_2, \ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n | T_n = s] = f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)} X_n\right] = \int_{(0,t]} f(s)\, d\eta(s)\,,\ t \geq 0,$$

suponiendo que la integral exista.

Corolario 37.2.47 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right] = \mu \mathbb{E}[N(t)+1]\,,\ t \geq 0,$$

37.2.38. Procesos de Renovación

Definición 37.2.127 *Sean $0 \leq T_1 \leq T_2 \leq \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0,t)$ es*

$$N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t)\,, \tag{37.2.127}$$

para $t \geq 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.2.128 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \geq 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0,t)$*

Nota 37.2.77 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^{n} \xi_k$ y $N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes NÃºmeros.*

37.2.39. Puntos de Renovación

Para cada cola Q_i se tienen los procesos de arribo a la cola, para estas, los tiempos de arribo están dados por

$$\left\{T_1^i, T_2^i, \ldots, T_k^i, \ldots\right\},$$

entonces, consideremos solamente los primeros tiempos de arribo a cada una de las colas, es decir,

$$\left\{T_1^1, T_1^2, T_1^3, T_1^4\right\},$$

se sabe que cada uno de estos tiempos se distribuye de manera exponencial con parámetro $1/mu_i$. Además se sabe que para

$$T^* = \text{mín}\left\{T_1^1, T_1^2, T_1^3, T_1^4\right\},$$

T^* se distribuye de manera exponencial con parámetro

$$\mu^* = \sum_{i=1}^{4} \mu_i.$$

Ahora, dado que

$$\tilde{r} = r_1 + r_2 \quad \text{y} \quad \hat{r} = r_3 + r_4.$$

Supongamos que

$$\tilde{r}, \hat{r} < \mu^*,$$

entonces si tomamos

$$r^* = \text{mín}\left\{\tilde{r}, \hat{r}\right\},$$

se tiene que para

$$t^* \in (0, r^*)$$

se cumple que

$$\tau_1(1) = 0 \quad \text{y por tanto} \quad \overline{\tau}_1 = 0,$$

entonces para la segunda cola en este primer ciclo se cumple que

$$\tau_2 = \overline{\tau}_1 + r_1 = r_1 < \mu^*,$$

y por tanto se tiene que

$$\overline{\tau}_2 = \tau_2.$$

Por lo tanto, nuevamente para la primer cola en el segundo ciclo

$$\tau_1(2) = \tau_2(1) + r_2 = \tilde{r} < \mu^*.$$

Análogamente para el segundo sistema se tiene que ambas colas están vacías, es decir, existe un valor t^* tal que en el intervalo $(0, t^*)$ no ha llegado ningún usuario, es decir,

$$L_i(t^*) = 0$$

para $i = 1, 2, 3, 4$.

37.2.40. Resultados para Procesos de Salida

En [40] prueban que para la existencia de un una sucesión infinita no decreciente de tiempos de regeneración $\tau_1 \leq \tau_2 \leq \cdots$ en los cuales el proceso se regenera, basta un tiempo de regeneración R_1, donde $R_j = \tau_j - \tau_{j-1}$. Para tal efecto se requiere la existencia de un espacio de probabilidad $(\Omega, \mathcal{F}, \mathbb{P})$, y proceso estocástico $X = \{X(t) : t \geq 0\}$ con espacio de estados $(S, \mathcal{R})$, con $\mathcal{R}$ σ-álgebra.

Proposición 37.2.66 *Si existe una variable aleatoria no negativa R_1 tal que $\theta_{R1}X =_D X$, entonces $(\Omega, \mathcal{F}, \mathbb{P})$ puede extenderse para soportar una sucesión estacionaria de variables aleatorias $R = \{R_k : k \geq 1\}$, tal que para $k \geq 1$,*

$$\theta_k(X, R) =_D (X, R).$$

Además, para $k \geq 1$, $\theta_k R$ es condicionalmente independiente de $(X, R_1, \ldots, R_k)$, dado $\theta_{\tau k}X$.

- Doob en 1953 demostró que el estado estacionario de un proceso de partida en un sistema de espera $M/G/\infty$, es Poisson con la misma tasa que el proceso de arribos.
- Burke en 1968, fue el primero en demostrar que el estado estacionario de un proceso de salida de una cola $M/M/s$ es un proceso Poisson.
- Disney en 1973 obtuvo el siguiente resultado:

Teorema 37.2.90 *Para el sistema de espera $M/G/1/L$ con disciplina FIFO, el proceso $\boldsymbol{I}$ es un proceso de renovación si y sólo si el proceso denominado longitud de la cola es estacionario y se cumple cualquiera de los siguientes casos:*

a) Los tiempos de servicio son identicamente cero;
b) $L = 0$, para cualquier proceso de servicio S;
c) $L = 1$ y $G = D$;
d) $L = \infty$ y $G = M$.

En estos casos, respectivamente, las distribuciones de interpartida $P\{T_{n+1} - T_n \leq t\}$ son

a) $1 - e^{-\lambda t}$, $t \geq 0$;
b) $1 - e^{-\lambda t} * F(t)$, $t \geq 0$;
c) $1 - e^{-\lambda t} * \mathbb{1}_d(t)$, $t \geq 0$;
d) $1 - e^{-\lambda t} * F(t)$, $t \geq 0$.

- Finch (1959) mostró que para los sistemas $M/G/1/L$, con $1 \leq L \leq \infty$ con distribuciones de servicio dos veces diferenciable, solamente el sistema $M/M/1/\infty$ tiene proceso de salida de renovación estacionario.
- King (1971) demostro que un sistema de colas estacionario $M/G/1/1$ tiene sus tiempos de interpartida sucesivas D_n y D_{n+1} son independientes, si y sólo si, $G = D$, en cuyo caso le proceso de salida es de renovación.
- Disney (1973) demostró que el único sistema estacionario $M/G/1/L$, que tiene proceso de salida de renovación son los sistemas $M/M/1$ y $M/D/1/1$.
- El siguiente resultado es de Disney y Koning (1985)

  Teorema 37.2.91 *En un sistema de espera $M/G/s$, el estado estacionario del proceso de salida es un proceso Poisson para cualquier distribución de los tiempos de servicio si el sistema tiene cualquiera de las siguientes cuatro propiedades.*

  a) $s = \infty$
  b) La disciplina de servicio es de procesador compartido.
  c) La disciplina de servicio es LCFS y preemptive resume, esto se cumple para $L < \infty$
  d) $G = M$.

- El siguiente resultado es de Alamatsaz (1983)

  Teorema 37.2.92 *En cualquier sistema de colas $GI/G/1/L$ con $1 \leq L < \infty$ y distribución de interarribos A y distribución de los tiempos de servicio B, tal que $A(0) = 0$, $A(t)(1 - B(t)) > 0$ para alguna $t > 0$ y $B(t)$ para toda $t > 0$, es imposible que el proceso de salida estacionario sea de renovación.*

Estos resultados aparecen en Daley (1968) [13] para $\{T_n\}$ intervalos de inter-arribo, $\{D_n\}$ intervalos de inter-salida y $\{S_n\}$ tiempos de servicio.

- Si el proceso $\{T_n\}$ es Poisson, el proceso $\{D_n\}$ es no correlacionado si y sólo si es un proceso Poisso, lo cual ocurre si y sólo si $\{S_n\}$ son exponenciales negativas.
- Si $\{S_n\}$ son exponenciales negativas, $\{D_n\}$ es un proceso de renovación si y sólo si es un proceso Poisson, lo cual ocurre si y sólo si $\{T_n\}$ es un proceso Poisson.
- $\mathbb{E}(D_n) = \mathbb{E}(T_n)$.
- Para un sistema de visitas $GI/M/1$ se tiene el siguiente teorema:

  Teorema 37.2.93 *En un sistema estacionario $GI/M/1$ los intervalos de interpartida tienen*

$$\begin{aligned}
\mathbb{E}\left(e^{-\theta D_n}\right) &= \mu(\mu+\theta)^{-1}\left[\delta\theta - \mu(1-\delta)\alpha(\theta)\right]\left[\theta - \mu(1-\delta)^{-1}\right] \\
\alpha(\theta) &= \mathbb{E}\left[e^{-\theta T_0}\right] \\
var(D_n) &= var(T_0) - \left(\tau^{-1} - \delta^{-1}\right) 2\delta\left(\mathbb{E}(S_0)\right)^2(1-\delta)^{-1}.
\end{aligned}$$

  Teorema 37.2.94 *El proceso de salida de un sistema de colas estacionario $GI/M/1$ es un proceso de renovación si y sólo si el proceso de entrada es un proceso Poisson, en cuyo caso el proceso de salida es un proceso Poisson.*

  Teorema 37.2.95 *Los intervalos de interpartida $\{D_n\}$ de un sistema $M/G/1$ estacionario son no correlacionados si y sólo si la distribución de los tiempos de servicio es exponencial negativa, es decir, el sistema es de tipo $M/M/1$.*

37.2.41. Ya revisado

Defínanse los puntos de regenaración en el proceso $[L_1(t), L_2(t), \ldots, L_N(t)]$. Los puntos cuando la cola i es visitada y todos los $L_j(\tau_i(m)) = 0$ para $i = 1, 2$ son puntos de regeneración. Se llama ciclo regenerativo al intervalo entre dos puntos regenerativos sucesivos.

Sea M_i el número de ciclos de visita en un ciclo regenerativo, y sea $C_i^{(m)}$, para $m = 1, 2, \ldots, M_i$ la duración del m-ésimo ciclo de visita en un ciclo regenerativo. Se define el ciclo del tiempo de visita promedio $\mathbb{E}[C_i]$ como

$$\mathbb{E}[C_i] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right]}{\mathbb{E}[M_i]}$$

Sea la función generadora de momentos para L_i, el número de usuarios en la cola $Q_i(z)$ en cualquier momento, está dada por el tiempo promedio de $z^{L_i(t)}$ sobre el ciclo regenerativo definido anteriormente:

$$Q_i(z) = \mathbb{E}\left[z^{L_i(t)}\right] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i} \sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}\left[\sum_{m=1}^{M_i} \tau_i(m+1) - \tau_i(m)\right]}$$

M_i es un tiempo de paro en el proceso regenerativo con $\mathbb{E}[M_i] < \infty$, se sigue del lema de Wald que:

$$\begin{aligned}
\mathbb{E}\left[\sum_{m=1}^{M_i} \sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}[M_i]\,\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] \\
\mathbb{E}\left[\sum_{m=1}^{M_i} \tau_i(m+1) - \tau_i(m)\right] &= \mathbb{E}[M_i]\,\mathbb{E}[\tau_i(m+1) - \tau_i(m)]
\end{aligned}$$

por tanto se tiene que

$$Q_i(z) = \frac{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}[\tau_i(m+1) - \tau_i(m)]}$$

observar que el denominador es simplemente la duración promedio del tiempo del ciclo.

Se puede demostrar (ver Hideaki Takagi 1986) que

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = z\frac{F_i(z) - 1}{z - P_i(z)}$$

Durante el tiempo de intervisita para la cola i, $L_i(t)$ solamente se incrementa de manera que el incremento por intervalo de tiempo está dado por la función generadora de probabilidades de $P_i(z)$, por tanto la suma sobre el tiempo de intervisita puede evaluarse como:

$$\begin{aligned}
\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} \{P_i(z)\}^{t-\overline{\tau}_i(m)}\right] = \frac{1 - \mathbb{E}\left[\{P_i(z)\}^{\tau_i(m+1)-\overline{\tau}_i(m)}\right]}{1 - P_i(z)} \\
&= \frac{1 - I_i[P_i(z)]}{1 - P_i(z)}
\end{aligned}$$

por tanto

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = \frac{1 - F_i(z)}{1 - P_i(z)}$$

Haciendo uso de lo hasta ahora desarrollado se tiene que

$$\begin{aligned}
Q_i(z) &= \frac{1}{\mathbb{E}[C_i]} \cdot \frac{1 - F_i(z)}{P_i(z) - z} \cdot \frac{(1-z)P_i(z)}{1 - P_i(z)} \\
&= \frac{\mu_i(1-\mu_i)}{f_i(i)} \cdot \frac{1 - F_i(z)}{P_i(z) - z} \cdot \frac{(1-z)P_i(z)}{1 - P_i(z)}
\end{aligned}$$

Definición 37.2.129 *Sea L_i^* el número de usuarios en la cola Q_i cuando es visitada por el servidor para dar servicio, entonces*

$$\mathbb{E}\left[L_i^*\right] = f_i(i) \tag{37.2.128}$$
$$Var\left[L_i^*\right] = f_i(i,i) + \mathbb{E}\left[L_i^*\right] - \mathbb{E}\left[L_i^*\right]^2. \tag{37.2.129}$$

Definición 37.2.130 *El tiempo de intervisita I_i es el periodo de tiempo que comienza cuando se ha completado el servicio en un ciclo y termina cuando es visitada nuevamente en el próximo ciclo. Su duración del mismo está dada por $\tau_i(m+1) - \overline{\tau}_i(m)$.*

Recordemos las siguientes expresiones:

$$\begin{aligned}
S_i(z) &= \mathbb{E}\left[z^{\overline{\tau}_i(m)-\tau_i(m)}\right] = F_i(\theta(z)), \\
F(z) &= \mathbb{E}\left[z^{L_0}\right], \\
P(z) &= \mathbb{E}\left[z^{X_n}\right], \\
F_i(z) &= \mathbb{E}\left[z^{L_i(\tau_i(m))}\right], \theta_i(z) - zP_i
\end{aligned}$$

entonces

$$\begin{aligned}
\mathbb{E}\left[S_i\right] &= \frac{\mathbb{E}\left[L_i^*\right]}{1-\mu_i} = \frac{f_i(i)}{1-\mu_i}, \\
Var\left[S_i\right] &= \frac{Var\left[L_i^*\right]}{(1-\mu_i)^2} + \frac{\sigma^2\mathbb{E}\left[L_i^*\right]}{(1-\mu_i)^3}
\end{aligned}$$

donde recordemos que

$$Var\left[L_i^*\right] = f_i(i,i) + f_i(i) - f_i(i)^2.$$

La duración del tiempo de intervisita es $\tau_i(m+1) - \overline{\tau}(m)$. Dado que el número de usuarios presentes en Q_i al tiempo $t = \tau_i(m+1)$ es igual al número de arribos durante el intervalo de tiempo $[\overline{\tau}(m), \tau_i(m+1)]$ se tiene que

$$\mathbb{E}\left[z_i^{L_i(\tau_i(m+1))}\right] = \mathbb{E}\left[\{P_i(z_i)\}^{\tau_i(m+1)-\overline{\tau}(m)}\right]$$

entonces, si

$$I_i(z) = \mathbb{E}\left[z^{\tau_i(m+1)-\overline{\tau}(m)}\right]$$

se tienen que

$$F_i(z) = I_i\left[P_i(z)\right]$$

para $i = 1, 2$, por tanto

$$\begin{aligned}
\mathbb{E}\left[L_i^*\right] &= \mu_i\mathbb{E}\left[I_i\right] \\
Var\left[L_i^*\right] &= \mu_i^2 Var\left[I_i\right] + \sigma^2\mathbb{E}\left[I_i\right]
\end{aligned}$$

para $i = 1, 2$, por tanto

$$\mathbb{E}\left[I_i\right] = \frac{f_i(i)}{\mu_i},$$

además

$$Var\left[I_i\right] = \frac{Var\left[L_i^*\right]}{\mu_i^2} - \frac{\sigma_i^2}{\mu_i^2} f_i(i).$$

Si $C_i(z) = \mathbb{E}\left[z^{\overline{\tau}(m+1)-\overline{\tau}_i(m)}\right]$ el tiempo de duración del ciclo, entonces, por lo hasta ahora establecido, se tiene que

$$C_i(z) = I_i[\theta_i(z)],$$

entonces

$$\begin{aligned}
\mathbb{E}[C_i] &= \mathbb{E}[I_i]\,\mathbb{E}[\theta_i(z)] = \frac{\mathbb{E}\left[L_i^*\right]}{\mu_i}\frac{1}{1-\mu_i} = \frac{f_i(i)}{\mu_i(1-\mu_i)} \\
Var[C_i] &= \frac{Var\left[L_i^*\right]}{\mu_i^2(1-\mu_i)^2}.
\end{aligned}$$

Por tanto se tienen las siguientes igualdades

$$\begin{aligned}
\mathbb{E}[S_i] &= \mu_i\mathbb{E}[C_i], \\
\mathbb{E}[I_i] &= (1-\mu_i)\,\mathbb{E}[C_i]
\end{aligned}$$

derivando con respecto a z

$$\begin{aligned}
\frac{dQ_i(z)}{dz} &= \frac{(1-F_i(z))P_i(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\
&- \frac{(1-z)P_i(z)F_i'(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\
&- \frac{(1-z)(1-F_i(z))P_i(z)\left(P_i'(z)-1\right)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)^2} \\
&+ \frac{(1-z)(1-F_i(z))P_i'(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\
&+ \frac{(1-z)(1-F_i(z))P_i(z)P_i'(z)}{\mathbb{E}[C_i](1-P_i(z))^2(P_i(z)-z)}
\end{aligned}$$

Calculando el límite cuando $z \to 1^+$:

$$Q_i^{(1)}(z) = \lim_{z\to 1^+}\frac{dQ_i(z)}{dz} = \lim_{z\to 1}\frac{(1-F_i(z))P_i(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \tag{37.2.130}$$

$$- \lim_{z\to 1^+}\frac{(1-z)P_i(z)F_i'(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \tag{37.2.131}$$

$$- \lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i(z)\left(P_i'(z)-1\right)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)^2} \tag{37.2.132}$$

$$+ \lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i'(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \tag{37.2.133}$$

$$+ \lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i(z)P_i'(z)}{\mathbb{E}[C_i](1-P_i(z))^2(P_i(z)-z)} \tag{37.2.134}$$

Entonces:

$$\begin{aligned}
\lim_{z\to 1^+}\frac{(1-F_i(z))P_i(z)}{(1-P_i(z))(P_i(z)-z)} &= \lim_{z\to 1^+}\frac{\frac{d}{dz}\left[(1-F_i(z))P_i(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))(-z+P_i(z))\right]} \\
&= \lim_{z\to 1^+}\frac{-P_i(z)F_i'(z)+(1-F_i(z))P_i'(z)}{(1-P_i(z))\left(-1+P_i'(z)\right)-(-z+P_i(z))P_i'(z)}
\end{aligned}$$

$$\begin{aligned}
\lim_{z\to 1^+}\frac{(1-z)P_i(z)F_i'(z)}{(1-P_i(z))(P_i(z)-z)} &= \lim_{z\to 1^+}\frac{\frac{d}{dz}\left[(1-z)P_i(z)F_i'(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))(P_i(z)-z)\right]} \\
&= \lim_{z\to 1^+}\frac{-P_i(z)F_i'(z)+(1-z)F_i'(z)P_i'(z)+(1-z)P_i(z)F_i''(z)}{(1-P_i(z))\left(-1+P_i'(z)\right)-(-z+P_i(z))P_i'(z)}
\end{aligned}$$

$$\begin{aligned}
\lim_{z\to 1^+} \frac{(1-z)(1-F_i(z))P_i(z)\left(P_i^{'}(z)-1\right)}{(1-P_i(z))(P_i(z)-z)^2} &= \lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)(1-F_i(z))P_i(z)\left(P_i^{'}(z)-1\right)\right]}{\frac{d}{dz}\left[(1-P_i(z))(P_i(z)-z)^2\right]} \\
= \lim_{z\to 1^+} & \frac{-(1-F_i(z))P_i(z)\left(-1+P_i^{'}(z)\right)-(1-z)P_i(z)F_i^{'}(z)\left(-1+P_i^{'}(z)\right)}{2(1-P_i(z))(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2P_i^{'}(z)} \\
+ \lim_{z\to 1^+} & \frac{+(1-z)(1-F_i(z))\left(-1+P_i^{'}(z)\right)P_i^{'}(z)}{2(1-P_i(z))(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2P_i^{'}(z)} \\
+ \lim_{z\to 1^+} & \frac{+(1-z)(1-F_i(z))P_i(z)P_i^{''}(z)}{2(1-P_i(z))(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2P_i^{'}(z)}
\end{aligned}$$

$$\begin{aligned}
\lim_{z\to 1^+} \frac{(1-z)(1-F_i(z))P_i^{'}(z)}{(1-P_i(z))(P_i(z)-z)} &= \lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)(1-F_i(z))P_i^{'}(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))(P_i(z)-z)\right]} \\
= \lim_{z\to 1^+} & \frac{-(1-F_i(z))P_i^{'}(z)-(1-z)F_i^{'}(z)P_i^{'}(z)+(1-z)(1-F_i(z))P_i^{''}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))P_i^{'}(z)}
\end{aligned}$$

$$\begin{aligned}
\lim_{z\to 1^+} \frac{(1-z)(1-F_i(z))P_i(z)P_i^{'}(z)}{(1-P_i(z))^2(P_i(z)-z)} &= \lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)(1-F_i(z))P_i(z)P_i^{'}(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))^2(P_i(z)-z)\right]} \\
= \lim_{z\to 1^+} & \frac{-(1-F_i(z))P_i(z)P_i^{'}(z)-(1-z)P_i(z)F_i^{'}(z)P_i^{'}[z]}{(1-P_i(z))^2\left(-1+P_i^{'}(z)\right)-2(1-P_i(z))(-z+P_i(z))P_i^{'}(z)} \\
+ \lim_{z\to 1^+} & \frac{(1-z)(1-F_i(z))P_i^{'}(z)^2+(1-z)(1-F_i(z))P_i(z)P_i^{''}(z)}{(1-P_i(z))^2\left(-1+P_i^{'}(z)\right)-2(1-P_i(z))(-z+P_i(z))P_i^{'}(z)}
\end{aligned}$$

En nuestra notación $V(t) \equiv C_i$ y $X_i = C_i^{(m)}$ para nuestra segunda definición, mientras que para la primera la notación es: $X(t) \equiv C_i$ y $R_i \equiv C_i^{(m)}$.

Definición 37.2.131 *Sea L_i^* el número de usuarios en la cola Q_i cuando es visitada por el servidor para dar servicio, entonces*

$$\begin{aligned}
\mathbb{E}[L_i^*] &= f_i(i) && (37.2.135)\\
Var[L_i^*] &= f_i(i,i)+\mathbb{E}[L_i^*]-\mathbb{E}[L_i^*]^2. && (37.2.136)
\end{aligned}$$

Definición 37.2.132 *El tiempo de Ciclo C_i es e periodo de tiempo que comienza cuando la cola i es visitada por primera vez en un ciclo, y termina cuando es visitado nuevamente en el próximo ciclo. La duración del mismo está dada por $\tau_i(m+1)-\tau_i(m)$, o equivalentemente $\overline{\tau}_i(m+1)-\overline{\tau}_i(m)$ bajo condiciones de estabilidad.*

Definición 37.2.133 *El tiempo de intervisita I_i es el periodo de tiempo que comienza cuando se ha completado el servicio en un ciclo y termina cuando es visitada nuevamente en el próximo ciclo. Su duración del mismo está dada por $\tau_i(m+1)-\overline{\tau}_i(m)$.*

Recordemos las siguientes expresiones:

$$\begin{aligned}
S_i(z) &= \mathbb{E}\left[z^{\overline{\tau}_i(m)-\tau_i(m)}\right] = F_i(\theta(z)),\\
F(z) &= \mathbb{E}\left[z^{L_0}\right],\\
P(z) &= \mathbb{E}\left[z^{X_n}\right],\\
F_i(z) &= \mathbb{E}\left[z^{L_i(\tau_i(m))}\right], \theta_i(z)-zP_i
\end{aligned}$$

entonces

$$\begin{aligned}
\mathbb{E}[S_i] &= \frac{\mathbb{E}\left[L_i^*\right]}{1-\mu_i} = \frac{f_i(i)}{1-\mu_i},\\
Var[S_i] &= \frac{Var\left[L_i^*\right]}{(1-\mu_i)^2}+\frac{\sigma^2\mathbb{E}\left[L_i^*\right]}{(1-\mu_i)^3}
\end{aligned}$$

donde recordemos que

$$Var\left[L_i^*\right] = f_i(i,i) + f_i(i) - f_i(i)^2 .$$

La duración del tiempo de intervisita es $\tau_i(m+1) - \overline{\tau}(m)$. Dado que el número de usuarios presentes en Q_i al tiempo $t = \tau_i(m+1)$ es igual al número de arribos durante el intervalo de tiempo $[\overline{\tau}(m), \tau_i(m+1)]$ se tiene que

$$\mathbb{E}\left[z_i^{L_i(\tau_i(m+1))}\right] = \mathbb{E}\left[\{P_i(z_i)\}^{\tau_i(m+1)-\overline{\tau}(m)}\right]$$

entonces, si

$$I_i(z) = \mathbb{E}\left[z^{\tau_i(m+1)-\overline{\tau}(m)}\right]$$

se tienen que

$$F_i(z) = I_i[P_i(z)]$$

para $i = 1, 2$, por tanto

$$\begin{aligned} \mathbb{E}\left[L_i^*\right] &= \mu_i \mathbb{E}[I_i] \\ Var\left[L_i^*\right] &= \mu_i^2 Var[I_i] + \sigma^2 \mathbb{E}[I_i] \end{aligned}$$

para $i = 1, 2$, por tanto

$$\mathbb{E}[I_i] = \frac{f_i(i)}{\mu_i},$$

además

$$Var[I_i] = \frac{Var\left[L_i^*\right]}{\mu_i^2} - \frac{\sigma_i^2}{\mu_i^2} f_i(i) .$$

Si $C_i(z) = \mathbb{E}\left[z^{\overline{\tau}(m+1)-\overline{\tau}_i(m)}\right]$el tiempo de duración del ciclo, entonces, por lo hasta ahora establecido, se tiene que

$$C_i(z) = I_i[\theta_i(z)],$$

entonces

$$\begin{aligned} \mathbb{E}[C_i] &= \mathbb{E}[I_i]\,\mathbb{E}[\theta_i(z)] = \frac{\mathbb{E}\left[L_i^*\right]}{\mu_i}\frac{1}{1-\mu_i} = \frac{f_i(i)}{\mu_i(1-\mu_i)} \\ Var[C_i] &= \frac{Var\left[L_i^*\right]}{\mu_i^2(1-\mu_i)^2}. \end{aligned}$$

Por tanto se tienen las siguientes igualdades

$$\begin{aligned} \mathbb{E}[S_i] &= \mu_i \mathbb{E}[C_i], \\ \mathbb{E}[I_i] &= (1-\mu_i)\,\mathbb{E}[C_i] \end{aligned}$$

Defínanse los puntos de regenaración en el proceso $[L_1(t), L_2(t), \ldots, L_N(t)]$. Los puntos cuando la cola i es visitada y todos los $L_j(\tau_i(m)) = 0$ para $i = 1, 2$ son puntos de regeneración. Se llama ciclo regenerativo al intervalo entre dos puntos regenerativos sucesivos.

Sea M_i el número de ciclos de visita en un ciclo regenerativo, y sea $C_i^{(m)}$, para $m = 1, 2, \ldots, M_i$ la duración del m-ésimo ciclo de visita en un ciclo regenerativo. Se define el ciclo del tiempo de visita promedio $\mathbb{E}[C_i]$ como

$$\mathbb{E}[C_i] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right]}{\mathbb{E}[M_i]}$$

En Stid72 y Heym82 se muestra que una condición suficiente para que el proceso regenerativo estacionario sea un procesoo estacionario es que el valor esperado del tiempo del ciclo regenerativo sea finito:

$$\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right] < \infty.$$

como cada $C_i^{(m)}$ contiene intervalos de réplica positivos, se tiene que $\mathbb{E}[M_i] < \infty$, además, como $M_i > 0$, se tiene que la condición anterior es equivalente a tener que

$$\mathbb{E}[C_i] < \infty,$$

por lo tanto una condición suficiente para la existencia del proceso regenerativo está dada por

$$\sum_{k=1}^{N} \mu_k < 1.$$

Nota 37.2.78 *En Stidham[41] y Heyman se muestra que una condición suficiente para que el proceso regenerativo estacionario sea un procesoo estacionario es que el valor esperado del tiempo del ciclo regenerativo sea finito:*

$$\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right] < \infty.$$

como cada $C_i^{(m)}$ contiene intervalos de réplica positivos, se tiene que $\mathbb{E}[M_i] < \infty$, además, como $M_i > 0$, se tiene que la condición anterior es equivalente a tener que

$$\mathbb{E}[C_i] < \infty,$$

por lo tanto una condición suficiente para la existencia del proceso regenerativo está dada por

$$\sum_{k=1}^{N} \mu_k < 1.$$

Nota incompleta!!

37.2.42. Procesos de Renovación y Regenerativos

Se puede demostrar (ver Hideaki Takagi 1986) que

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = z\frac{F_i(z)-1}{z-P_i(z)}$$

Durante el tiempo de intervisita para la cola i, $L_i(t)$ solamente se incrementa de manera que el incremento por intervalo de tiempo está dado por la función generadora de probabilidades de $P_i(z)$, por tanto la suma sobre el tiempo de intervisita puede evaluarse como:

$$\begin{aligned}\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} \{P_i(z)\}^{t-\overline{\tau}_i(m)}\right] = \frac{1-\mathbb{E}\left[\{P_i(z)\}^{\tau_i(m+1)-\overline{\tau}_i(m)}\right]}{1-P_i(z)} \\ &= \frac{1-I_i[P_i(z)]}{1-P_i(z)}\end{aligned}$$

por tanto

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = \frac{1-F_i(z)}{1-P_i(z)}$$

Haciendo uso de lo hasta ahora desarrollado se tiene que

Sea

$$Q_i(z) = \frac{1}{\mathbb{E}[C_i]} \cdot \frac{1-F_i(z)}{P_i(z)-z} \cdot \frac{(1-z)P_i(z)}{1-P_i(z)}$$

Consideremos una cola de la red de sistemas de visitas cíclicas fija, Q_l.

Conforme a la definición dada al principio del capítulo, definición (37.8.1), sean $T_1, T_2, \ldots$ los puntos donde las longitudes de las colas de la red de sistemas de visitas cíclicas son cero simultáneamente, cuando la cola Q_l es visitada por el servidor para dar servicio, es decir, $L_1(T_i) = 0, L_2(T_i) = 0, \hat{L}_1(T_i) = 0$ y $\hat{L}_2(T_i) = 0$, a estos puntos se les denominará puntos regenerativos. Entonces,

Definición 37.2.134 *Al intervalo de tiempo entre dos puntos regenerativos se le llamará ciclo regenerativo.*

Definición 37.2.135 *Para T_i se define, M_i, el número de ciclos de visita a la cola Q_l, durante el ciclo regenerativo, es decir, M_i es un proceso de renovación.*

Definición 37.2.136 *Para cada uno de los M_i's, se definen a su vez la duración de cada uno de estos ciclos de visita en el ciclo regenerativo, $C_i^{(m)}$, para $m = 1, 2, \ldots, M_i$, que a su vez, también es n proceso de renovación.*

En nuestra notación $V(t) \equiv C_i$ y $X_i = C_i^{(m)}$ para nuestra segunda definición, mientras que para la primera la notación es: $X(t) \equiv C_i$ y $R_i \equiv C_i^{(m)}$.

Definición 37.2.137 *Sea L_i^*el número de usuarios en la cola Q_i cuando es visitada por el servidor para dar servicio, entonces*

$$\mathbb{E}[L_i^*] = f_i(i) \tag{37.2.137}$$

$$Var[L_i^*] = f_i(i,i) + \mathbb{E}[L_i^*] - \mathbb{E}[L_i^*]^2. \tag{37.2.138}$$

Definición 37.2.138 *El tiempo de Ciclo C_i es e periodo de tiempo que comienza cuando la cola i es visitada por primera vez en un ciclo, y termina cuando es visitado nuevamente en el próximo ciclo. La duración del mismo está dada por $\tau_i(m+1) - \tau_i(m)$, o equivalentemente $\overline{\tau}_i(m+1) - \overline{\tau}_i(m)$ bajo condiciones de estabilidad.*

Recordemos las siguientes expresiones:

$$\begin{aligned}
S_i(z) &= \mathbb{E}\left[z^{\overline{\tau}_i(m)-\tau_i(m)}\right] = F_i(\theta(z)), \\
F(z) &= \mathbb{E}\left[z^{L_0}\right], \\
P(z) &= \mathbb{E}\left[z^{X_n}\right], \\
F_i(z) &= \mathbb{E}\left[z^{L_i(\tau_i(m))}\right], \theta_i(z) - zP_i
\end{aligned}$$

entonces

$$\begin{aligned}
\mathbb{E}[S_i] &= \frac{\mathbb{E}\left[L_i^*\right]}{1-\mu_i} = \frac{f_i(i)}{1-\mu_i}, \\
Var[S_i] &= \frac{Var\left[L_i^*\right]}{(1-\mu_i)^2} + \frac{\sigma^2 \mathbb{E}\left[L_i^*\right]}{(1-\mu_i)^3}
\end{aligned}$$

donde recordemos que

$$Var[L_i^*] = f_i(i,i) + f_i(i) - f_i(i)^2.$$

por tanto

$$\mathbb{E}[I_i] = \frac{f_i(i)}{\mu_i},$$

además

$$Var[I_i] = \frac{Var\left[L_i^*\right]}{\mu_i^2} - \frac{\sigma_i^2}{\mu_i^2} f_i(i).$$

Si $C_i(z) = \mathbb{E}\left[z^{\overline{\tau}(m+1)-\overline{\tau}_i(m)}\right]$el tiempo de duración del ciclo, entonces, por lo hasta ahora establecido, se tiene que

$$C_i(z) = I_i[\theta_i(z)],$$

entonces

$$\begin{aligned}
\mathbb{E}[C_i] &= \mathbb{E}[I_i]\,\mathbb{E}[\theta_i(z)] = \frac{\mathbb{E}\left[L_i^*\right]}{\mu_i}\frac{1}{1-\mu_i} = \frac{f_i(i)}{\mu_i(1-\mu_i)} \\
Var[C_i] &= \frac{Var\left[L_i^*\right]}{\mu_i^2(1-\mu_i)^2}.
\end{aligned}$$

Por tanto se tienen las siguientes igualdades

$$\begin{aligned}
\mathbb{E}[S_i] &= \mu_i\mathbb{E}[C_i], \\
\mathbb{E}[I_i] &= (1-\mu_i)\,\mathbb{E}[C_i]
\end{aligned}$$

Defínanse los puntos de regenaración en el proceso $[L_1(t), L_2(t), \ldots, L_N(t)]$. Los puntos cuando la cola i es visitada y todos los $L_j(\tau_i(m)) = 0$ para $i = 1, 2$ son puntos de regeneración. Se llama ciclo regenerativo al intervalo entre dos puntos regenerativos sucesivos.

Sea M_i el número de ciclos de visita en un ciclo regenerativo, y sea $C_i^{(m)}$, para $m = 1, 2, \ldots, M_i$ la duración del m-ésimo ciclo de visita en un ciclo regenerativo. Se define el ciclo del tiempo de visita promedio $\mathbb{E}[C_i]$ como

$$\mathbb{E}[C_i] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right]}{\mathbb{E}[M_i]}$$

En Stid72 y Heym82 se muestra que una condición suficiente para que el proceso regenerativo estacionario sea un procesoo estacionario es que el valor esperado del tiempo del ciclo regenerativo sea finito:

$$\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right] < \infty.$$

como cada $C_i^{(m)}$ contiene intervalos de réplica positivos, se tiene que $\mathbb{E}[M_i] < \infty$, además, como $M_i > 0$, se tiene que la condición anterior es equivalente a tener que

$$\mathbb{E}[C_i] < \infty,$$

por lo tanto una condición suficiente para la existencia del proceso regenerativo está dada por

$$\sum_{k=1}^{N} \mu_k < 1.$$

Sea la función generadora de momentos para L_i, el número de usuarios en la cola $Q_i(z)$ en cualquier momento, está dada por el tiempo promedio de $z^{L_i(t)}$ sobre el ciclo regenerativo definido anteriormente:

$$Q_i(z) = \mathbb{E}\left[z^{L_i(t)}\right] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i}\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}\left[\sum_{m=1}^{M_i}\tau_i(m+1)-\tau_i(m)\right]}$$

M_i es un tiempo de paro en el proceso regenerativo con $\mathbb{E}[M_i] < \infty$, se sigue del lema de Wald que:

$$\begin{aligned}
\mathbb{E}\left[\sum_{m=1}^{M_i}\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}[M_i]\,\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] \\
\mathbb{E}\left[\sum_{m=1}^{M_i}\tau_i(m+1)-\tau_i(m)\right] &= \mathbb{E}[M_i]\,\mathbb{E}[\tau_i(m+1)-\tau_i(m)]
\end{aligned}$$

por tanto se tiene que

$$Q_i(z) = \frac{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}\left[\tau_i(m+1)-\tau_i(m)\right]}$$

observar que el denominador es simplemente la duración promedio del tiempo del ciclo.

Se puede demostrar (ver Hideaki Takagi 1986) que

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = z\frac{F_i(z)-1}{z-P_i(z)}$$

Durante el tiempo de intervisita para la cola i, $L_i(t)$ solamente se incrementa de manera que el incremento por intervalo de tiempo está dado por la función generadora de probabilidades de $P_i(z)$, por tanto la suma sobre el tiempo de intervisita puede evaluarse como:

$$\begin{aligned}\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} \{P_i(z)\}^{t-\overline{\tau}_i(m)}\right] = \frac{1-\mathbb{E}\left[\{P_i(z)\}^{\tau_i(m+1)-\overline{\tau}_i(m)}\right]}{1-P_i(z)} \\ &= \frac{1-I_i\left[P_i(z)\right]}{1-P_i(z)}\end{aligned}$$

por tanto

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = \frac{1-F_i(z)}{1-P_i(z)}$$

Haciendo uso de lo hasta ahora desarrollado se tiene que

$$\begin{aligned}Q_i(z) &= \frac{1}{\mathbb{E}\left[C_i\right]}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)} \\ &= \frac{\mu_i(1-\mu_i)}{f_i(i)}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)}\end{aligned}$$

derivando con respecto a z

$$\begin{aligned}\frac{dQ_i(z)}{dz} &= \frac{(1-F_i(z))P_i(z)}{\mathbb{E}\left[C_i\right](1-P_i(z))(P_i(z)-z)} \\ &- \frac{(1-z)P_i(z)F_i'(z)}{\mathbb{E}\left[C_i\right](1-P_i(z))(P_i(z)-z)} \\ &- \frac{(1-z)(1-F_i(z))P_i(z)\left(P_i'(z)-1\right)}{\mathbb{E}\left[C_i\right](1-P_i(z))(P_i(z)-z)^2} \\ &+ \frac{(1-z)(1-F_i(z))P_i'(z)}{\mathbb{E}\left[C_i\right](1-P_i(z))(P_i(z)-z)} \\ &+ \frac{(1-z)(1-F_i(z))P_i(z)P_i'(z)}{\mathbb{E}\left[C_i\right](1-P_i(z))^2(P_i(z)-z)}\end{aligned}$$

Calculando el límite cuando $z \to 1^+$:

$$Q_i^{(1)}(z) = \lim_{z\to 1^+}\frac{dQ_i(z)}{dz} = \lim_{z\to 1}\frac{(1-F_i(z))P_i(z)}{\mathbb{E}\left[C_i\right](1-P_i(z))(P_i(z)-z)} \tag{37.2.139}$$

$$- \lim_{z\to 1^+}\frac{(1-z)P_i(z)F_i'(z)}{\mathbb{E}\left[C_i\right](1-P_i(z))(P_i(z)-z)} \tag{37.2.140}$$

$$- \lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i(z)\left(P_i'(z)-1\right)}{\mathbb{E}\left[C_i\right](1-P_i(z))(P_i(z)-z)^2} \tag{37.2.141}$$

$$+ \lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i'(z)}{\mathbb{E}\left[C_i\right](1-P_i(z))(P_i(z)-z)} \tag{37.2.142}$$

$$+ \lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i(z)P_i'(z)}{\mathbb{E}\left[C_i\right](1-P_i(z))^2(P_i(z)-z)} \tag{37.2.143}$$

Entonces:

$$\begin{aligned}
\lim_{z\to 1^+} \frac{(1-F_i(z))\,P_i(z)}{(1-P_i(z))\,(P_i(z)-z)} &= \lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-F_i(z))\,P_i(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))\,(-z+P_i(z))\right]} \\
&= \lim_{z\to 1^+} \frac{-P_i(z)\,F_i^{'}(z)+(1-F_i(z))\,P_i^{'}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))\,P_i^{'}(z)}
\end{aligned}$$

$$\begin{aligned}
\lim_{z\to 1^+} \frac{(1-z)\,P_i(z)\,F_i^{'}(z)}{(1-P_i(z))\,(P_i(z)-z)} &= \lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)\,P_i(z)\,F_i^{'}(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))\,(P_i(z)-z)\right]} \\
&= \lim_{z\to 1^+} \frac{-P_i(z)\,F_i^{'}(z)+(1-z)F_i^{'}(z)\,P_i^{'}(z)+(1-z)P_i(z)\,F_i^{''}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))\,P_i^{'}(z)}
\end{aligned}$$

$$\begin{aligned}
\lim_{z\to 1^+} \frac{(1-z)\,(1-F_i(z))\,P_i(z)\left(P_i^{'}(z)-1\right)}{(1-P_i(z))\,(P_i(z)-z)^2} &= \lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)\,(1-F_i(z))\,P_i(z)\left(P_i^{'}(z)-1\right)\right]}{\frac{d}{dz}\left[(1-P_i(z))\,(P_i(z)-z)^2\right]} \\
= \lim_{z\to 1^+} & \frac{-(1-F_i(z))\,P_i(z)\left(-1+P_i^{'}(z)\right)-(1-z)P_i(z)\,F_i^{'}(z)\left(-1+P_i^{'}(z)\right)}{2\,(1-P_i(z))\,(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2\,P_i^{'}(z)} \\
+ \lim_{z\to 1^+} & \frac{+(1-z)\,(1-F_i(z))\left(-1+P_i^{'}(z)\right)P_i^{'}(z)}{2\,(1-P_i(z))\,(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2\,P_i^{'}(z)} \\
+ \lim_{z\to 1^+} & \frac{+(1-z)\,(1-F_i(z))\,P_i(z)\,P_i^{''}(z)}{2\,(1-P_i(z))\,(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2\,P_i^{'}(z)}
\end{aligned}$$

$$\begin{aligned}
\lim_{z\to 1^+} \frac{(1-z)\,(1-F_i(z))\,P_i^{'}(z)}{(1-P_i(z))\,(P_i(z)-z)} &= \lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)\,(1-F_i(z))\,P_i^{'}(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))\,(P_i(z)-z)\right]} \\
= \lim_{z\to 1^+} & \frac{-(1-F_i(z))\,P_i^{'}(z)-(1-z)F_i^{'}(z)\,P_i^{'}(z)+(1-z)\,(1-F_i(z))\,P_i^{''}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))\,P_i^{'}(z)}
\end{aligned}$$

$$\begin{aligned}
\lim_{z\to 1^+} \frac{(1-z)\,(1-F_i(z))\,P_i(z)\,P_i^{'}(z)}{(1-P_i(z))^2\,(P_i(z)-z)} &= \lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)\,(1-F_i(z))\,P_i(z)\,P_i^{'}(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))^2\,(P_i(z)-z)\right]} \\
= \lim_{z\to 1^+} & \frac{-(1-F_i(z))\,P_i(z)\,P_i^{'}(z)-(1-z)P_i(z)\,F_i^{'}(z)\,P_i^{'}[z]}{(1-P_i(z))^2\left(-1+P_i^{'}(z)\right)-2\,(1-P_i(z))\,(-z+P_i(z))\,P_i^{'}(z)} \\
+ \lim_{z\to 1^+} & \frac{(1-z)\,(1-F_i(z))\,P_i^{'}(z)^2+(1-z)\,(1-F_i(z))\,P_i(z)\,P_i^{''}(z)}{(1-P_i(z))^2\left(-1+P_i^{'}(z)\right)-2\,(1-P_i(z))\,(-z+P_i(z))\,P_i^{'}(z)}
\end{aligned}$$

Definición 37.2.139 *Sea L_i^* el número de usuarios en la cola Q_i cuando es visitada por el servidor para dar servicio, entonces*

$$\mathbb{E}\left[L_i^*\right] = f_i(i) \tag{37.2.144}$$

$$Var\left[L_i^*\right] = f_i(i,i)+\mathbb{E}\left[L_i^*\right]-\mathbb{E}\left[L_i^*\right]^2. \tag{37.2.145}$$

Definición 37.2.140 *El tiempo de Ciclo C_i es e periodo de tiempo que comienza cuando la cola i es visitada por primera vez en un ciclo, y termina cuando es visitado nuevamente en el próximo ciclo. La duración del mismo está dada por $\tau_i(m+1)-\tau_i(m)$, o equivalentemente $\overline{\tau}_i(m+1)-\overline{\tau}_i(m)$ bajo condiciones de estabilidad.*

Definición 37.2.141 *El tiempo de intervisita I_i es el periodo de tiempo que comienza cuando se ha completado el servicio en un ciclo y termina cuando es visitada nuevamente en el próximo ciclo. Su duración del mismo está dada por $\tau_i(m+1)-\overline{\tau}_i(m)$.*

Recordemos las siguientes expresiones:

$$\begin{aligned}
S_i(z) &= \mathbb{E}\left[z^{\overline{\tau}_i(m)-\tau_i(m)}\right] = F_i(\theta(z)), \\
F(z) &= \mathbb{E}\left[z^{L_0}\right], \\
P(z) &= \mathbb{E}\left[z^{X_n}\right], \\
F_i(z) &= \mathbb{E}\left[z^{L_i(\tau_i(m))}\right], \theta_i(z) - zP_i
\end{aligned}$$

entonces

$$\begin{aligned}
\mathbb{E}[S_i] &= \frac{\mathbb{E}\left[L_i^*\right]}{1-\mu_i} = \frac{f_i(i)}{1-\mu_i}, \\
Var[S_i] &= \frac{Var\left[L_i^*\right]}{(1-\mu_i)^2} + \frac{\sigma^2\mathbb{E}\left[L_i^*\right]}{(1-\mu_i)^3}
\end{aligned}$$

donde recordemos que

$$Var\left[L_i^*\right] = f_i(i,i) + f_i(i) - f_i(i)^2.$$

La duración del tiempo de intervisita es $\tau_i(m+1) - \overline{\tau}(m)$. Dado que el número de usuarios presentes en Q_i al tiempo $t = \tau_i(m+1)$ es igual al número de arribos durante el intervalo de tiempo $[\overline{\tau}(m), \tau_i(m+1)]$ se tiene que

$$\mathbb{E}\left[z_i^{L_i(\tau_i(m+1))}\right] = \mathbb{E}\left[\{P_i(z_i)\}^{\tau_i(m+1)-\overline{\tau}(m)}\right]$$

entonces, si

$$I_i(z) = \mathbb{E}\left[z^{\tau_i(m+1)-\overline{\tau}(m)}\right]$$

se tienen que

$$F_i(z) = I_i[P_i(z)]$$

para $i = 1, 2$, por tanto

$$\begin{aligned}
\mathbb{E}\left[L_i^*\right] &= \mu_i\mathbb{E}[I_i] \\
Var\left[L_i^*\right] &= \mu_i^2 Var[I_i] + \sigma^2\mathbb{E}[I_i]
\end{aligned}$$

para $i = 1, 2$, por tanto

$$\mathbb{E}[I_i] = \frac{f_i(i)}{\mu_i},$$

además

$$Var[I_i] = \frac{Var\left[L_i^*\right]}{\mu_i^2} - \frac{\sigma_i^2}{\mu_i^2} f_i(i).$$

Si $C_i(z) = \mathbb{E}\left[z^{\overline{\tau}(m+1)-\overline{\tau}_i(m)}\right]$el tiempo de duración del ciclo, entonces, por lo hasta ahora establecido, se tiene que

$$C_i(z) = I_i[\theta_i(z)],$$

entonces

$$\begin{aligned}
\mathbb{E}[C_i] &= \mathbb{E}[I_i]\,\mathbb{E}[\theta_i(z)] = \frac{\mathbb{E}\left[L_i^*\right]}{\mu_i}\frac{1}{1-\mu_i} = \frac{f_i(i)}{\mu_i(1-\mu_i)} \\
Var[C_i] &= \frac{Var\left[L_i^*\right]}{\mu_i^2(1-\mu_i)^2}.
\end{aligned}$$

Por tanto se tienen las siguientes igualdades

$$\begin{aligned}\mathbb{E}[S_i] &= \mu_i \mathbb{E}[C_i], \\ \mathbb{E}[I_i] &= (1-\mu_i)\,\mathbb{E}[C_i]\end{aligned}$$

Defínanse los puntos de regenaración en el proceso $[L_1(t), L_2(t), \ldots, L_N(t)]$. Los puntos cuando la cola i es visitada y todos los $L_j(\tau_i(m)) = 0$ para $i = 1, 2$ son puntos de regeneración. Se llama ciclo regenerativo al intervalo entre dos puntos regenerativos sucesivos.

Sea M_i el número de ciclos de visita en un ciclo regenerativo, y sea $C_i^{(m)}$, para $m = 1, 2, \ldots, M_i$ la duración del m-ésimo ciclo de visita en un ciclo regenerativo. Se define el ciclo del tiempo de visita promedio $\mathbb{E}[C_i]$ como

$$\mathbb{E}[C_i] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right]}{\mathbb{E}[M_i]}$$

En Stid72 y Heym82 se muestra que una condición suficiente para que el proceso regenerativo estacionario sea un procesoo estacionario es que el valor esperado del tiempo del ciclo regenerativo sea finito:

$$\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right] < \infty.$$

como cada $C_i^{(m)}$ contiene intervalos de réplica positivos, se tiene que $\mathbb{E}[M_i] < \infty$, además, como $M_i > 0$, se tiene que la condición anterior es equivalente a tener que

$$\mathbb{E}[C_i] < \infty,$$

por lo tanto una condición suficiente para la existencia del proceso regenerativo está dada por

$$\sum_{k=1}^{N} \mu_k < 1.$$

Sea la función generadora de momentos para L_i, el número de usuarios en la cola $Q_i(z)$ en cualquier momento, está dada por el tiempo promedio de $z^{L_i(t)}$ sobre el ciclo regenerativo definido anteriormente:

$$Q_i(z) = \mathbb{E}\left[z^{L_i(t)}\right] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i} \sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}\left[\sum_{m=1}^{M_i} \tau_i(m+1) - \tau_i(m)\right]}$$

M_i es un tiempo de paro en el proceso regenerativo con $\mathbb{E}[M_i] < \infty$, se sigue del lema de Wald que:

$$\begin{aligned}\mathbb{E}\left[\sum_{m=1}^{M_i} \sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}[M_i]\,\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] \\ \mathbb{E}\left[\sum_{m=1}^{M_i} \tau_i(m+1) - \tau_i(m)\right] &= \mathbb{E}[M_i]\,\mathbb{E}[\tau_i(m+1) - \tau_i(m)]\end{aligned}$$

por tanto se tiene que

$$Q_i(z) = \frac{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}[\tau_i(m+1) - \tau_i(m)]}$$

observar que el denominador es simplemente la duración promedio del tiempo del ciclo.

Se puede demostrar (ver Hideaki Takagi 1986) que

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = z\frac{F_i(z) - 1}{z - P_i(z)}$$

Durante el tiempo de intervisita para la cola i, $L_i(t)$ solamente se incrementa de manera que el incremento por intervalo de tiempo está dado por la función generadora de probabilidades de $P_i(z)$, por tanto la suma sobre el tiempo de intervisita puede evaluarse como:

$$\begin{aligned}\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} \{P_i(z)\}^{t-\overline{\tau}_i(m)}\right] = \frac{1-\mathbb{E}\left[\{P_i(z)\}^{\tau_i(m+1)-\overline{\tau}_i(m)}\right]}{1-P_i(z)} \\ &= \frac{1-I_i[P_i(z)]}{1-P_i(z)}\end{aligned}$$

por tanto

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = \frac{1-F_i(z)}{1-P_i(z)}$$

Haciendo uso de lo hasta ahora desarrollado se tiene que

$$\begin{aligned}Q_i(z) &= \frac{1}{\mathbb{E}[C_i]}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)} \\ &= \frac{\mu_i(1-\mu_i)}{f_i(i)}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)}\end{aligned}$$

Sea $V_i(z) = \frac{1}{\mathbb{E}[C_i]}\frac{I_i(z)-1}{z-P_i(z)}$

$$\frac{\partial V_i(z)}{\partial z} = \frac{1}{\mathbb{E}[C_i]}\left[\frac{I_i{}'(z)(z-P_i(z))}{z-P_i(z)} - \frac{(I_i(z)-1)(1-P_i{}'(z))}{(z-P_i(z))^2}\right]$$

La FGP para el tiempo de espera para cualquier usuario en la cola está dada por:

$$U_i(z) = \frac{1}{\mathbb{E}[C_i]}\cdot\frac{1-P_i(z)}{z-P_i(z)}\cdot\frac{I_i(z)-1}{1-z}$$

entonces

$$\begin{aligned}\frac{d}{dz}V_i(z) &= \frac{1}{\mathbb{E}[C_i]}\left\{\frac{d}{dz}\left(\frac{1-P_i(z)}{z-P_i(z)}\right)\frac{I_i(z)-1}{1-z} + \frac{1-P_i(z)}{z-P_i(z)}\frac{d}{dz}\left(\frac{I_i(z)-1}{1-z}\right)\right\} \\ &= \frac{1}{\mathbb{E}[C_i]}\left\{\frac{-P_i(z)(z-P_i(z)) - (1-P_i(z))\left(1-P_i'(z)\right)}{(z-P_i(z))^2}\cdot\frac{I_i(z)-1}{1-z}\right\} \\ &+ \frac{1}{\mathbb{E}[C_i]}\left\{\frac{1-P_i(z)}{z-P_i(z)}\cdot\frac{I_i'(z)(1-z)+(I_i(z)-1)}{(1-z)^2}\right\}\end{aligned}$$

$$\begin{aligned}\frac{\partial U_i(z)}{\partial z} &= \frac{(-1+I_i[z])(1-P_i[z])}{(1-z)^2\mathbb{E}[I_i](z-P_i[z])} + \frac{(1-P_i[z])I_i'[z]}{(1-z)\mathbb{E}[I_i](z-P_i[z])} - \frac{(-1+I_i[z])(1-P_i[z])(1-P'[z])}{(1-z)\mathbb{E}[I_i](z-P_i[z])^2} \\ &- \frac{(-1+I_i[z])P_i{}'[z]}{(1-z)\mathbb{E}[I_i](z-P_i[z])}\end{aligned}$$

Sea

$$Q_i(z) = \frac{1}{\mathbb{E}[C_i]}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)}$$

derivando con respecto a z

$$\begin{aligned}\frac{dQ_i(z)}{dz} &= \frac{(1-F_i(z))P_i(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\ &- \frac{(1-z)P_i(z)F_i'(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\ &- \frac{(1-z)(1-F_i(z))P_i(z)\left(P_i'(z)-1\right)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)^2} \\ &+ \frac{(1-z)(1-F_i(z))P_i'(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\ &+ \frac{(1-z)(1-F_i(z))P_i(z)P_i'(z)}{\mathbb{E}[C_i](1-P_i(z))^2(P_i(z)-z)}\end{aligned}$$

Calculando el límite cuando $z \to 1^+$:

$$Q_i^{(1)}(z) = \lim_{z\to 1^+} \frac{dQ_i(z)}{dz} = \lim_{z\to 1} \frac{(1-F_i(z))\,P_i(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \tag{37.2.146}$$

$$- \lim_{z\to 1^+} \frac{(1-z)\,P_i(z)\,F_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \tag{37.2.147}$$

$$- \lim_{z\to 1^+} \frac{(1-z)(1-F_i(z))\,P_i(z)\left(P_i^{'}(z)-1\right)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)^2} \tag{37.2.148}$$

\end{aligned}$$

37.2.43. Tiempo de Ciclo Promedio

Consideremos una cola de la red de sistemas de visitas cíclicas fija, Q_l.

Conforme a la definición dada al principio del capítulo, definición (37.8.1), sean $T_1, T_2, \ldots$ los puntos donde las longitudes de las colas de la red de sistemas de visitas cíclicas son cero simultáneamente, cuando la cola Q_l es visitada por el servidor para dar servicio, es decir, $L_1(T_i) = 0, L_2(T_i) = 0, \hat{L}_1(T_i) = 0$ y $\hat{L}_2(T_i) = 0$, a estos puntos se les denominará puntos regenerativos. Entonces,

Definición 37.2.142 *Al intervalo de tiempo entre dos puntos regenerativos se le llamará ciclo regenerativo.*

Definición 37.2.143 *Para T_i se define, M_i, el número de ciclos de visita a la cola Q_l, durante el ciclo regenerativo, es decir, M_i es un proceso de renovación.*

Definición 37.2.144 *Para cada uno de los M_i's, se definen a su vez la duración de cada uno de estos ciclos de visita en el ciclo regenerativo, $C_i^{(m)}$, para $m = 1, 2, \ldots, M_i$, que a su vez, también es n proceso de renovación.*

En nuestra notación $V(t) \equiv C_i$ y $X_i = C_i^{(m)}$ para nuestra segunda definición, mientras que para la primera la notación es: $X(t) \equiv C_i$ y $R_i \equiv C_i^{(m)}$.

37.2.44. Tiempos de Ciclo e Intervisita

Definición 37.2.145 *Sea L_i^* el número de usuarios en la cola Q_i cuando es visitada por el servidor para dar servicio, entonces*

$$\mathbb{E}[L_i^*] = f_i(i) \tag{37.2.151}$$

$$Var[L_i^*] = f_i(i,i) + \mathbb{E}[L_i^*] - \mathbb{E}[L_i^*]^2. \tag{37.2.152}$$

Definición 37.2.146 *El tiempo de Ciclo C_i es e periodo de tiempo que comienza cuando la cola i es visitada por primera vez en un ciclo, y termina cuando es visitado nuevamente en el próximo ciclo. La duración del mismo está dada por $\tau_i(m+1) - \tau_i(m)$, o equivalentemente $\overline{\tau}_i(m+1) - \overline{\tau}_i(m)$ bajo condiciones de estabilidad.*

Definición 37.2.147 *El tiempo de intervisita I_i es el periodo de tiempo que comienza cuando se ha completado el servicio en un ciclo y termina cuando es visitada nuevamente en el próximo ciclo. Su duración del mismo está dada por $\tau_i(m+1) - \overline{\tau}_i(m)$.*

Recordemos las siguientes expresiones:

$$\begin{aligned}
S_i(z) &= \mathbb{E}\left[z^{\overline{\tau}_i(m)-\tau_i(m)}\right] = F_i(\theta(z)), \\
F(z) &= \mathbb{E}\left[z^{L_0}\right], \\
P(z) &= \mathbb{E}\left[z^{X_n}\right], \\
F_i(z) &= \mathbb{E}\left[z^{L_i(\tau_i(m))}\right], \theta_i(z) - zP_i
\end{aligned}$$

entonces

$$\begin{aligned}
\mathbb{E}[S_i] &= \frac{\mathbb{E}[L_i^*]}{1-\mu_i} = \frac{f_i(i)}{1-\mu_i}, \\
Var[S_i] &= \frac{Var[L_i^*]}{(1-\mu_i)^2} + \frac{\sigma^2 \mathbb{E}[L_i^*]}{(1-\mu_i)^3}
\end{aligned}$$

donde recordemos que

$$Var[L_i^*] = f_i(i,i) + f_i(i) - f_i(i)^2.$$

La duración del tiempo de intervisita es $\tau_i(m+1) - \overline{\tau}(m)$. Dado que el número de usuarios presentes en Q_i al tiempo $t = \tau_i(m+1)$ es igual al número de arribos durante el intervalo de tiempo $[\overline{\tau}(m), \tau_i(m+1)]$ se tiene que

$$\mathbb{E}\left[z_i^{L_i(\tau_i(m+1))}\right] = \mathbb{E}\left[\{P_i(z_i)\}^{\tau_i(m+1)-\overline{\tau}(m)}\right]$$

entonces, si

$$I_i(z) = \mathbb{E}\left[z^{\tau_i(m+1)-\overline{\tau}(m)}\right]$$

se tienen que

$$F_i(z) = I_i[P_i(z)]$$

para $i = 1, 2$, por tanto

$$\begin{aligned} \mathbb{E}[L_i^*] &= \mu_i \mathbb{E}[I_i] \\ Var[L_i^*] &= \mu_i^2 Var[I_i] + \sigma^2 \mathbb{E}[I_i] \end{aligned}$$

para $i = 1, 2$, por tanto

$$\mathbb{E}[I_i] = \frac{f_i(i)}{\mu_i},$$

además

$$Var[I_i] = \frac{Var[L_i^*]}{\mu_i^2} - \frac{\sigma_i^2}{\mu_i^2} f_i(i).$$

Si $C_i(z) = \mathbb{E}\left[z^{\overline{\tau}(m+1)-\overline{\tau}_i(m)}\right]$el tiempo de duración del ciclo, entonces, por lo hasta ahora establecido, se tiene que

$$C_i(z) = I_i[\theta_i(z)],$$

entonces

$$\begin{aligned} \mathbb{E}[C_i] &= \mathbb{E}[I_i]\mathbb{E}[\theta_i(z)] = \frac{\mathbb{E}[L_i^*]}{\mu_i}\frac{1}{1-\mu_i} = \frac{f_i(i)}{\mu_i(1-\mu_i)} \\ Var[C_i] &= \frac{Var[L_i^*]}{\mu_i^2(1-\mu_i)^2}. \end{aligned}$$

Por tanto se tienen las siguientes igualdades

$$\begin{aligned} \mathbb{E}[S_i] &= \mu_i \mathbb{E}[C_i], \\ \mathbb{E}[I_i] &= (1-\mu_i)\mathbb{E}[C_i] \end{aligned}$$

Defínanse los puntos de regenaración en el proceso $[L_1(t), L_2(t), \ldots, L_N(t)]$. Los puntos cuando la cola i es visitada y todos los $L_j(\tau_i(m)) = 0$ para $i = 1, 2$ son puntos de regeneración. Se llama ciclo regenerativo al intervalo entre dos puntos regenerativos sucesivos.

Sea M_i el número de ciclos de visita en un ciclo regenerativo, y sea $C_i^{(m)}$, para $m = 1, 2, \ldots, M_i$ la duración del m-ésimo ciclo de visita en un ciclo regenerativo. Se define el ciclo del tiempo de visita promedio $\mathbb{E}[C_i]$ como

$$\mathbb{E}[C_i] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right]}{\mathbb{E}[M_i]}$$

En Stid72 y Heym82 se muestra que una condición suficiente para que el proceso regenerativo estacionario sea un procesoo estacionario es que el valor esperado del tiempo del ciclo regenerativo sea finito:

$$\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right] < \infty.$$

como cada $C_i^{(m)}$ contiene intervalos de réplica positivos, se tiene que $\mathbb{E}[M_i] < \infty$, además, como $M_i > 0$, se tiene que la condición anterior es equivalente a tener que

$$\mathbb{E}[C_i] < \infty,$$

por lo tanto una condición suficiente para la existencia del proceso regenerativo está dada por

$$\sum_{k=1}^{N} \mu_k < 1.$$

Sea la función generadora de momentos para L_i, el número de usuarios en la cola $Q_i(z)$ en cualquier momento, está dada por el tiempo promedio de $z^{L_i(t)}$ sobre el ciclo regenerativo definido anteriormente:

$$Q_i(z) = \mathbb{E}\left[z^{L_i(t)}\right] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i}\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}\left[\sum_{m=1}^{M_i}\tau_i(m+1)-\tau_i(m)\right]}$$

M_i es un tiempo de paro en el proceso regenerativo con $\mathbb{E}[M_i] < \infty$, se sigue del lema de Wald que:

$$\begin{aligned}
\mathbb{E}\left[\sum_{m=1}^{M_i}\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}[M_i]\,\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] \\
\mathbb{E}\left[\sum_{m=1}^{M_i}\tau_i(m+1)-\tau_i(m)\right] &= \mathbb{E}[M_i]\,\mathbb{E}[\tau_i(m+1)-\tau_i(m)]
\end{aligned}$$

por tanto se tiene que

$$Q_i(z) = \frac{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}[\tau_i(m+1)-\tau_i(m)]}$$

observar que el denominador es simplemente la duración promedio del tiempo del ciclo.

Se puede demostrar (ver Hideaki Takagi 1986) que

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = z\frac{F_i(z)-1}{z-P_i(z)}$$

Durante el tiempo de intervisita para la cola i, $L_i(t)$ solamente se incrementa de manera que el incremento por intervalo de tiempo está dado por la función generadora de probabilidades de $P_i(z)$, por tanto la suma sobre el tiempo de intervisita puede evaluarse como:

$$\begin{aligned}
\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} \{P_i(z)\}^{t-\overline{\tau}_i(m)}\right] = \frac{1-\mathbb{E}\left[\{P_i(z)\}^{\tau_i(m+1)-\overline{\tau}_i(m)}\right]}{1-P_i(z)} \\
&= \frac{1-I_i[P_i(z)]}{1-P_i(z)}
\end{aligned}$$

por tanto

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = \frac{1-F_i(z)}{1-P_i(z)}$$

Haciendo uso de lo hasta ahora desarrollado se tiene que

$$\begin{aligned}
Q_i(z) &= \frac{1}{\mathbb{E}[C_i]}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)} \\
&= \frac{\mu_i(1-\mu_i)}{f_i(i)}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)}
\end{aligned}$$

37.2.45. Longitudes de la Cola en cualquier tiempo

Sea

$$Q_i(z) = \frac{1}{\mathbb{E}[C_i]}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)}$$

derivando con respecto a z

$$\begin{aligned}
\frac{dQ_i(z)}{dz} &= \frac{(1-F_i(z))\,P_i(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\
&- \frac{(1-z)\,P_i(z)\,F_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\
&- \frac{(1-z)(1-F_i(z))\,P_i(z)\left(P_i^{'}(z)-1\right)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)^2} \\
&+ \frac{(1-z)(1-F_i(z))\,P_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\
&+ \frac{(1-z)(1-F_i(z))\,P_i(z)\,P_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))^2(P_i(z)-z)}
\end{aligned}$$

Calculando el límite cuando $z \to 1^+$:

$$Q_i^{(1)}(z) = \lim_{z\to 1^+}\frac{dQ_i(z)}{dz} = \lim_{z\to 1}\frac{(1-F_i(z))\,P_i(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \tag{37.2.153}$$

$$- \lim_{z\to 1^+}\frac{(1-z)\,P_i(z)\,F_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \tag{37.2.154}$$

$$- \lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))\,P_i(z)\left(P_i^{'}(z)-1\right)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)^2} \tag{37.2.155}$$

$$+ \lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))\,P_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \tag{37.2.156}$$

$$+ \lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))\,P_i(z)\,P_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))^2(P_i(z)-z)} \tag{37.2.157}$$

Entonces:

$$\begin{aligned}
\lim_{z\to 1^+}\frac{(1-F_i(z))\,P_i(z)}{(1-P_i(z))(P_i(z)-z)} &= \lim_{z\to 1^+}\frac{\frac{d}{dz}\left[(1-F_i(z))\,P_i(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))(-z+P_i(z))\right]} \\
&= \lim_{z\to 1^+}\frac{-P_i(z)\,F_i^{'}(z)+(1-F_i(z))\,P_i^{'}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))\,P_i^{'}(z)}
\end{aligned}$$

$$\begin{aligned}
\lim_{z\to 1^+}\frac{(1-z)\,P_i(z)\,F_i^{'}(z)}{(1-P_i(z))(P_i(z)-z)} &= \lim_{z\to 1^+}\frac{\frac{d}{dz}\left[(1-z)\,P_i(z)\,F_i^{'}(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))(P_i(z)-z)\right]} \\
&= \lim_{z\to 1^+}\frac{-P_i(z)\,F_i^{'}(z)+(1-z)F_i^{'}(z)\,P_i^{'}(z)+(1-z)P_i(z)\,F_i^{''}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))\,P_i^{'}(z)}
\end{aligned}$$

$$\lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))\,P_i(z)\left(P_i^{'}(z)-1\right)}{(1-P_i(z))(P_i(z)-z)^2} = \lim_{z\to 1^+}\frac{\frac{d}{dz}\left[(1-z)(1-F_i(z))\,P_i(z)\left(P_i^{'}(z)-1\right)\right]}{\frac{d}{dz}\left[(1-P_i(z))(P_i(z)-z)^2\right]}$$

$$\begin{aligned}
= &\lim_{z\to 1^+}\frac{-(1-F_i(z))\,P_i(z)\left(-1+P_i^{'}(z)\right)-(1-z)P_i(z)\,F_i^{'}(z)\left(-1+P_i^{'}(z)\right)}{2(1-P_i(z))(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2\,P_i^{'}(z)} \\
+ &\lim_{z\to 1^+}\frac{+(1-z)(1-F_i(z))\left(-1+P_i^{'}(z)\right)P_i^{'}(z)}{2(1-P_i(z))(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2\,P_i^{'}(z)} \\
+ &\lim_{z\to 1^+}\frac{+(1-z)(1-F_i(z))\,P_i(z)\,P_i^{''}(z)}{2(1-P_i(z))(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2\,P_i^{'}(z)}
\end{aligned}$$

$$\begin{aligned}
\lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))\,P_i^{'}(z)}{(1-P_i(z))(P_i(z)-z)} &= \lim_{z\to 1^+}\frac{\frac{d}{dz}\left[(1-z)(1-F_i(z))\,P_i^{'}(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))(P_i(z)-z)\right]} \\
= &\lim_{z\to 1^+}\frac{-(1-F_i(z))\,P_i^{'}(z)-(1-z)F_i^{'}(z)\,P_i^{'}(z)+(1-z)(1-F_i(z))\,P_i^{''}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))\,P_i^{'}(z)}
\end{aligned}$$

$$\begin{aligned}
& \lim_{z\to 1^+} \frac{(1-z)(1-F_i(z))P_i(z)P_i^{'}(z)}{(1-P_i(z))^2(P_i(z)-z)} = \lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)(1-F_i(z))P_i(z)P_i^{'}(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))^2(P_i(z)-z)\right]} \\
= & \lim_{z\to 1^+} \frac{-(1-F_i(z))P_i(z)P_i^{'}(z)-(1-z)P_i(z)F_i^{'}(z)P_i'[z]}{(1-P_i(z))^2\left(-1+P_i^{'}(z)\right)-2(1-P_i(z))(-z+P_i(z))P_i^{'}(z)} \\
+ & \lim_{z\to 1^+} \frac{(1-z)(1-F_i(z))P_i^{'}(z)^2+(1-z)(1-F_i(z))P_i(z)P_i^{''}(z)}{(1-P_i(z))^2\left(-1+P_i^{'}(z)\right)-2(1-P_i(z))(-z+P_i(z))P_i^{'}(z)}
\end{aligned}$$

37.2.46. Por resolver

$$\begin{aligned}
& \frac{\partial Q_i(z)}{\partial z} = \frac{1}{\mathbb{E}[C_i]}\frac{\partial}{\partial z}\left\{\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)}\right\} \\
= & \frac{1}{\mathbb{E}[C_i]}\left\{\frac{\partial}{\partial z}\left(\frac{1-F_i(z)}{P_i(z)-z}\right)\cdot\frac{(1-z)P_i(z)}{1-P_i(z)}+\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{\partial}{\partial z}\left(\frac{(1-z)P_i(z)}{1-P_i(z)}\right)\right\} \\
= & \frac{1}{\mathbb{E}[C_i]}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)}\cdot\frac{\partial}{\partial z}\left(\frac{1-F_i(z)}{P_i(z)-z}\right)+\frac{1}{\mathbb{E}[C_i]}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{\partial}{\partial z}\left(\frac{(1-z)P_i(z)}{1-P_i(z)}\right) \\
= & \frac{1}{\mathbb{E}[C_i]}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)}\cdot\frac{-F_i^{'}(z)(P_i(z)-z)-(1-F_i(z))\left(P_i^{'}(z)-1\right)}{(P_i(z)-z)^2} \\
+ & \frac{1}{\mathbb{E}[C_i]}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i^{'}(z)-P_i(z)}{(1-P_i(z))^2}
\end{aligned}$$

$$\begin{aligned}
Q_i^{(1)}(z) &= \frac{(1-F_i(z))P_i(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)}-\frac{(1-z)P_i(z)F_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\
&- \frac{(1-z)(1-F_i(z))P_i(z)\left(P_i^{'}(z)-1\right)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)^2}+\frac{(1-z)(1-F_i(z))P_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))(P_i(z)-z)} \\
&+ \frac{(1-z)(1-F_i(z))P_i(z)P_i^{'}(z)}{\mathbb{E}[C_i](1-P_i(z))^2(P_i(z)-z)}
\end{aligned}$$

Sea $V_i(z)=\frac{1}{\mathbb{E}[C_i]}\frac{I_i(z)-1}{z-P_i(z)}$

$$\frac{\partial V_i(z)}{\partial z} = \frac{1}{\mathbb{E}[C_i]}\left[\frac{I_i{}'(z)(z-P_i(z))}{z-P_i(z)}-\frac{(I_i(z)-1)(1-P_i{}'(z))}{(z-P_i(z))^2}\right]$$

La FGP para el tiempo de espera para cualquier usuario en la cola está dada por:

$$U_i(z)=\frac{1}{\mathbb{E}[C_i]}\cdot\frac{1-P_i(z)}{z-P_i(z)}\cdot\frac{I_i(z)-1}{1-z}$$

entonces

$$\begin{aligned}
\frac{d}{dz}V_i(z) &= \frac{1}{\mathbb{E}[C_i]}\left\{\frac{d}{dz}\left(\frac{1-P_i(z)}{z-P_i(z)}\right)\frac{I_i(z)-1}{1-z}+\frac{1-P_i(z)}{z-P_i(z)}\frac{d}{dz}\left(\frac{I_i(z)-1}{1-z}\right)\right\} \\
&= \frac{1}{\mathbb{E}[C_i]}\left\{\frac{-P_i(z)(z-P_i(z))-(1-P_i(z))\left(1-P_i^{'}(z)\right)}{(z-P_i(z))^2}\cdot\frac{I_i(z)-1}{1-z}\right\} \\
&+ \frac{1}{\mathbb{E}[C_i]}\left\{\frac{1-P_i(z)}{z-P_i(z)}\cdot\frac{I_i^{'}(z)(1-z)+(I_i(z)-1)}{(1-z)^2}\right\}
\end{aligned}$$

$$\begin{aligned}
\frac{\partial U_i(z)}{\partial z} &= \frac{(-1+I_i[z])(1-P_i[z])}{(1-z)^2\mathbb{E}[I_i](z-P_i[z])}+\frac{(1-P_i[z])I_i^{'}[z]}{(1-z)\mathbb{E}[I_i](z-P_i[z])}-\frac{(-1+I_i[z])(1-P_i[z])(1-P'[z])}{(1-z)\mathbb{E}[I_i](z-P_i[z])^2} \\
&- \frac{(-1+I_i[z])P_i{}'[z]}{(1-z)\mathbb{E}[I_i](z-P_i[z])}
\end{aligned}$$

37.2.47. Tiempos de Ciclo e Intervisita

Definición 37.2.148 *Sea L_i^* el número de usuarios en la cola Q_i cuando es visitada por el servidor para dar servicio, entonces*

$$\begin{aligned} \mathbb{E}\left[L_i^*\right] &= f_i\left(i\right) && (37.2.158) \\ Var\left[L_i^*\right] &= f_i\left(i,i\right) + \mathbb{E}\left[L_i^*\right] - \mathbb{E}\left[L_i^*\right]^2. && (37.2.159) \end{aligned}$$

Definición 37.2.149 *El tiempo de Ciclo C_i es e periodo de tiempo que comienza cuando la cola i es visitada por primera vez en un ciclo, y termina cuando es visitado nuevamente en el próximo ciclo. La duración del mismo está dada por $\tau_i\left(m+1\right) - \tau_i\left(m\right)$, o equivalentemente $\overline{\tau}_i\left(m+1\right) - \overline{\tau}_i\left(m\right)$ bajo condiciones de estabilidad.*

Definición 37.2.150 *El tiempo de intervisita I_i es el periodo de tiempo que comienza cuando se ha completado el servicio en un ciclo y termina cuando es visitada nuevamente en el próximo ciclo. Su duración del mismo está dada por $\tau_i\left(m+1\right) - \overline{\tau}_i\left(m\right)$.*

Recordemos las siguientes expresiones:

$$\begin{aligned} S_i\left(z\right) &= \mathbb{E}\left[z^{\overline{\tau}_i(m)-\tau_i(m)}\right] = F_i\left(\theta\left(z\right)\right), \\ F\left(z\right) &= \mathbb{E}\left[z^{L_0}\right], \\ P\left(z\right) &= \mathbb{E}\left[z^{X_n}\right], \\ F_i\left(z\right) &= \mathbb{E}\left[z^{L_i(\tau_i(m))}\right], \theta_i\left(z\right) - zP_i \end{aligned}$$

entonces

$$\begin{aligned} \mathbb{E}\left[S_i\right] &= \frac{\mathbb{E}\left[L_i^*\right]}{1-\mu_i} = \frac{f_i\left(i\right)}{1-\mu_i}, \\ Var\left[S_i\right] &= \frac{Var\left[L_i^*\right]}{\left(1-\mu_i\right)^2} + \frac{\sigma^2\mathbb{E}\left[L_i^*\right]}{\left(1-\mu_i\right)^3} \end{aligned}$$

donde recordemos que

$$Var\left[L_i^*\right] = f_i\left(i,i\right) + f_i\left(i\right) - f_i\left(i\right)^2.$$

La duración del tiempo de intervisita es $\tau_i\left(m+1\right) - \overline{\tau}\left(m\right)$. Dado que el número de usuarios presentes en Q_i al tiempo $t = \tau_i\left(m+1\right)$ es igual al número de arribos durante el intervalo de tiempo $\left[\overline{\tau}\left(m\right), \tau_i\left(m+1\right)\right]$ se tiene que

$$\mathbb{E}\left[z_i^{L_i(\tau_i(m+1))}\right] = \mathbb{E}\left[\left\{P_i\left(z_i\right)\right\}^{\tau_i(m+1)-\overline{\tau}(m)}\right]$$

entonces, si

$$I_i\left(z\right) = \mathbb{E}\left[z^{\tau_i(m+1)-\overline{\tau}(m)}\right]$$

se tienen que

$$F_i\left(z\right) = I_i\left[P_i\left(z\right)\right]$$

para $i = 1, 2$, por tanto

$$\begin{aligned} \mathbb{E}\left[L_i^*\right] &= \mu_i\mathbb{E}\left[I_i\right] \\ Var\left[L_i^*\right] &= \mu_i^2 Var\left[I_i\right] + \sigma^2\mathbb{E}\left[I_i\right] \end{aligned}$$

para $i = 1, 2$, por tanto

$$\mathbb{E}\left[I_i\right] = \frac{f_i\left(i\right)}{\mu_i},$$

además

$$Var\left[I_i\right] = \frac{Var\left[L_i^*\right]}{\mu_i^2} - \frac{\sigma_i^2}{\mu_i^2} f_i\left(i\right).$$

Si $C_i\left(z\right) = \mathbb{E}\left[z^{\overline{\tau}(m+1)-\overline{\tau}_i(m)}\right]$el tiempo de duración del ciclo, entonces, por lo hasta ahora establecido, se tiene que

$$C_i\left(z\right) = I_i\left[\theta_i\left(z\right)\right],$$

entonces

$$\begin{aligned}
\mathbb{E}\left[C_i\right] &= \mathbb{E}\left[I_i\right]\mathbb{E}\left[\theta_i\left(z\right)\right] = \frac{\mathbb{E}\left[L_i^*\right]}{\mu_i}\frac{1}{1-\mu_i} = \frac{f_i\left(i\right)}{\mu_i\left(1-\mu_i\right)} \\
Var\left[C_i\right] &= \frac{Var\left[L_i^*\right]}{\mu_i^2\left(1-\mu_i\right)^2}.
\end{aligned}$$

Por tanto se tienen las siguientes igualdades

$$\begin{aligned}
\mathbb{E}\left[S_i\right] &= \mu_i\mathbb{E}\left[C_i\right], \\
\mathbb{E}\left[I_i\right] &= \left(1-\mu_i\right)\mathbb{E}\left[C_i\right]
\end{aligned}$$

Defínanse los puntos de regenaración en el proceso $\left[L_1\left(t\right), L_2\left(t\right), \ldots, L_N\left(t\right)\right]$. Los puntos cuando la cola i es visitada y todos los $L_j\left(\tau_i\left(m\right)\right) = 0$ para $i = 1, 2$ son puntos de regeneración. Se llama ciclo regenerativo al intervalo entre dos puntos regenerativos sucesivos.

Sea M_i el número de ciclos de visita en un ciclo regenerativo, y sea $C_i^{(m)}$, para $m = 1, 2, \ldots, M_i$ la duración del m-ésimo ciclo de visita en un ciclo regenerativo. Se define el ciclo del tiempo de visita promedio $\mathbb{E}\left[C_i\right]$ como

$$\mathbb{E}\left[C_i\right] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right]}{\mathbb{E}\left[M_i\right]}$$

En Stid72 y Heym82 se muestra que una condición suficiente para que el proceso regenerativo estacionario sea un procesoo estacionario es que el valor esperado del tiempo del ciclo regenerativo sea finito:

$$\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right] < \infty.$$

como cada $C_i^{(m)}$ contiene intervalos de réplica positivos, se tiene que $\mathbb{E}\left[M_i\right] < \infty$, además, como $M_i > 0$, se tiene que la condición anterior es equivalente a tener que

$$\mathbb{E}\left[C_i\right] < \infty,$$

por lo tanto una condición suficiente para la existencia del proceso regenerativo está dada por

$$\sum_{k=1}^{N} \mu_k < 1.$$

Sea la función generadora de momentos para L_i, el número de usuarios en la cola $Q_i\left(z\right)$ en cualquier momento, está dada por el tiempo promedio de $z^{L_i(t)}$ sobre el ciclo regenerativo definido anteriormente:

$$Q_i\left(z\right) = \mathbb{E}\left[z^{L_i(t)}\right] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i}\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}\left[\sum_{m=1}^{M_i}\tau_i\left(m+1\right)-\tau_i\left(m\right)\right]}$$

M_i es un tiempo de paro en el proceso regenerativo con $\mathbb{E}\left[M_i\right] < \infty$, se sigue del lema de Wald que:

$$\begin{aligned}
\mathbb{E}\left[\sum_{m=1}^{M_i}\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}\left[M_i\right]\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] \\
\mathbb{E}\left[\sum_{m=1}^{M_i}\tau_i\left(m+1\right)-\tau_i\left(m\right)\right] &= \mathbb{E}\left[M_i\right]\mathbb{E}\left[\tau_i\left(m+1\right)-\tau_i\left(m\right)\right]
\end{aligned}$$

por tanto se tiene que

$$Q_i(z) = \frac{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}\left[\tau_i(m+1)-\tau_i(m)\right]}$$

observar que el denominador es simplemente la duración promedio del tiempo del ciclo.

Se puede demostrar (ver Hideaki Takagi 1986) que

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = z\frac{F_i(z)-1}{z-P_i(z)}$$

Durante el tiempo de intervisita para la cola i, $L_i(t)$ solamente se incrementa de manera que el incremento por intervalo de tiempo está dado por la función generadora de probabilidades de $P_i(z)$, por tanto la suma sobre el tiempo de intervisita puede evaluarse como:

$$\begin{aligned}\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} \{P_i(z)\}^{t-\overline{\tau}_i(m)}\right] = \frac{1-\mathbb{E}\left[\{P_i(z)\}^{\tau_i(m+1)-\overline{\tau}_i(m)}\right]}{1-P_i(z)} \\ &= \frac{1-I_i\left[P_i(z)\right]}{1-P_i(z)}\end{aligned}$$

por tanto

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = \frac{1-F_i(z)}{1-P_i(z)}$$

Haciendo uso de lo hasta ahora desarrollado se tiene que

$$\begin{aligned}Q_i(z) &= \frac{1}{\mathbb{E}\left[C_i\right]}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)} \\ &= \frac{\mu_i(1-\mu_i)}{f_i(i)}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)}\end{aligned}$$

derivando con respecto a z

$$\begin{aligned}\frac{dQ_i(z)}{dz} &= \frac{(1-F_i(z))P_i(z)}{\mathbb{E}\left[C_i\right](1-P_i(z))(P_i(z)-z)} \\ &- \frac{(1-z)P_i(z)F_i'(z)}{\mathbb{E}\left[C_i\right](1-P_i(z))(P_i(z)-z)} \\ &- \frac{(1-z)(1-F_i(z))P_i(z)\left(P_i'(z)-1\right)}{\mathbb{E}\left[C_i\right](1-P_i(z))(P_i(z)-z)^2} \\ &+ \frac{(1-z)(1-F_i(z))P_i'(z)}{\mathbb{E}\left[C_i\right](1-P_i(z))(P_i(z)-z)} \\ &+ \frac{(1-z)(1-F_i(z))P_i(z)P_i'(z)}{\mathbb{E}\left[C_i\right](1-P_i(z))^2(P_i(z)-z)}\end{aligned}$$

Calculando el límite cuando $z \to 1^+$:

$$Q_i^{(1)}(z) = \lim_{z\to 1^+}\frac{dQ_i(z)}{dz} = \lim_{z\to 1}\frac{(1-F_i(z))P_i(z)}{\mathbb{E}\left[C_i\right](1-P_i(z))(P_i(z)-z)} \tag{37.2.160}$$

$$- \lim_{z\to 1^+}\frac{(1-z)P_i(z)F_i'(z)}{\mathbb{E}\left[C_i\right](1-P_i(z))(P_i(z)-z)} \tag{37.2.161}$$

$$- \lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i(z)\left(P_i'(z)-1\right)}{\mathbb{E}\left[C_i\right](1-P_i(z))(P_i(z)-z)^2} \tag{37.2.162}$$

$$+ \lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i'(z)}{\mathbb{E}\left[C_i\right](1-P_i(z))(P_i(z)-z)} \tag{37.2.163}$$

$$+ \lim_{z\to 1^+}\frac{(1-z)(1-F_i(z))P_i(z)P_i'(z)}{\mathbb{E}\left[C_i\right](1-P_i(z))^2(P_i(z)-z)} \tag{37.2.164}$$

Entonces:

$$\begin{aligned}
\lim_{z\to 1^+} \frac{(1-F_i(z))\,P_i(z)}{(1-P_i(z))\,(P_i(z)-z)} &= \lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-F_i(z))\,P_i(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))\,(-z+P_i(z))\right]} \\
&= \lim_{z\to 1^+} \frac{-P_i(z)\,F_i^{'}(z)+(1-F_i(z))\,P_i^{'}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))\,P_i^{'}(z)}
\end{aligned}$$

$$\begin{aligned}
\lim_{z\to 1^+} \frac{(1-z)\,P_i(z)\,F_i^{'}(z)}{(1-P_i(z))\,(P_i(z)-z)} &= \lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)\,P_i(z)\,F_i^{'}(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))\,(P_i(z)-z)\right]} \\
&= \lim_{z\to 1^+} \frac{-P_i(z)\,F_i^{'}(z)+(1-z)F_i^{'}(z)\,P_i^{'}(z)+(1-z)P_i(z)\,F_i^{''}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))\,P_i^{'}(z)}
\end{aligned}$$

$$\lim_{z\to 1^+} \frac{(1-z)\,(1-F_i(z))\,P_i(z)\left(P_i^{'}(z)-1\right)}{(1-P_i(z))\,(P_i(z)-z)^2} = \lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)\,(1-F_i(z))\,P_i(z)\left(P_i^{'}(z)-1\right)\right]}{\frac{d}{dz}\left[(1-P_i(z))\,(P_i(z)-z)^2\right]}$$

$$\begin{aligned}
= & \lim_{z\to 1^+} \frac{-(1-F_i(z))\,P_i(z)\left(-1+P_i^{'}(z)\right)-(1-z)P_i(z)\,F_i^{'}(z)\left(-1+P_i^{'}(z)\right)}{2\,(1-P_i(z))\,(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2\,P_i^{'}(z)} \\
+ & \lim_{z\to 1^+} \frac{+(1-z)\,(1-F_i(z))\left(-1+P_i^{'}(z)\right)P_i^{'}(z)}{2\,(1-P_i(z))\,(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2\,P_i^{'}(z)} \\
+ & \lim_{z\to 1^+} \frac{+(1-z)\,(1-F_i(z))\,P_i(z)\,P_i^{''}(z)}{2\,(1-P_i(z))\,(-z+P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))^2\,P_i^{'}(z)}
\end{aligned}$$

$$\begin{aligned}
\lim_{z\to 1^+} \frac{(1-z)\,(1-F_i(z))\,P_i^{'}(z)}{(1-P_i(z))\,(P_i(z)-z)} &= \lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)\,(1-F_i(z))\,P_i^{'}(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))\,(P_i(z)-z)\right]} \\
= & \lim_{z\to 1^+} \frac{-(1-F_i(z))\,P_i^{'}(z)-(1-z)F_i^{'}(z)\,P_i^{'}(z)+(1-z)\,(1-F_i(z))\,P_i^{''}(z)}{(1-P_i(z))\left(-1+P_i^{'}(z)\right)-(-z+P_i(z))\,P_i^{'}(z)}
\end{aligned}$$

$$\begin{aligned}
\lim_{z\to 1^+} \frac{(1-z)\,(1-F_i(z))\,P_i(z)\,P_i^{'}(z)}{(1-P_i(z))^2\,(P_i(z)-z)} &= \lim_{z\to 1^+} \frac{\frac{d}{dz}\left[(1-z)\,(1-F_i(z))\,P_i(z)\,P_i^{'}(z)\right]}{\frac{d}{dz}\left[(1-P_i(z))^2\,(P_i(z)-z)\right]} \\
= & \lim_{z\to 1^+} \frac{-(1-F_i(z))\,P_i(z)\,P_i^{'}(z)-(1-z)P_i(z)\,F_i^{'}(z)\,P_i^{'}[z]}{(1-P_i(z))^2\left(-1+P_i^{'}(z)\right)-2\,(1-P_i(z))\,(-z+P_i(z))\,P_i^{'}(z)} \\
+ & \lim_{z\to 1^+} \frac{(1-z)\,(1-F_i(z))\,P_i^{'}(z)^2+(1-z)\,(1-F_i(z))\,P_i(z)\,P_i^{''}(z)}{(1-P_i(z))^2\left(-1+P_i^{'}(z)\right)-2\,(1-P_i(z))\,(-z+P_i(z))\,P_i^{'}(z)}
\end{aligned}$$

37.2.48. Longitudes de la Cola en cualquier tiempo

Sea $V_i(z)=\frac{1}{\mathbb{E}[C_i]}\frac{I_i(z)-1}{z-P_i(z)}$

$$\frac{\partial V_i(z)}{\partial z} = \frac{1}{\mathbb{E}[C_i]}\left[\frac{I_i{}'(z)\,(z-P_i(z))}{z-P_i(z)}-\frac{(I_i(z)-1)\,(1-P_i{}'(z))}{(z-P_i(z))^2}\right]$$

La FGP para el tiempo de espera para cualquier usuario en la cola está dada por:

$$U_i(z)=\frac{1}{\mathbb{E}[C_i]}\cdot\frac{1-P_i(z)}{z-P_i(z)}\cdot\frac{I_i(z)-1}{1-z}$$

entonces

$$\begin{aligned}
\frac{d}{dz}V_i(z) &= \frac{1}{\mathbb{E}[C_i]}\left\{\frac{d}{dz}\left(\frac{1-P_i(z)}{z-P_i(z)}\right)\frac{I_i(z)-1}{1-z}+\frac{1-P_i(z)}{z-P_i(z)}\frac{d}{dz}\left(\frac{I_i(z)-1}{1-z}\right)\right\} \\
&= \frac{1}{\mathbb{E}[C_i]}\left\{\frac{-P_i(z)\,(z-P_i(z))-(1-P_i(z))\left(1-P_i^{'}(z)\right)}{(z-P_i(z))^2}\cdot\frac{I_i(z)-1}{1-z}\right\} \\
&+ \frac{1}{\mathbb{E}[C_i]}\left\{\frac{1-P_i(z)}{z-P_i(z)}\cdot\frac{I_i^{'}(z)\,(1-z)+(I_i(z)-1)}{(1-z)^2}\right\}
\end{aligned}$$

$$\begin{aligned}\frac{\partial U_i(z)}{\partial z} &= \frac{(-1+I_i[z])(1-P_i[z])}{(1-z)^2\mathbb{E}[I_i](z-P_i[z])}+\frac{(1-P_i[z])I_i'[z]}{(1-z)\mathbb{E}[I_i](z-P_i[z])}-\frac{(-1+I_i[z])(1-P_i[z])(1-P'[z])}{(1-z)\mathbb{E}[I_i](z-P_i[z])^2}\\ &- \frac{(-1+I_i[z])P_i'[z]}{(1-z)\mathbb{E}[I_i](z-P_i[z])}\end{aligned}$$

37.2.49. Material por agregar

Teorema 37.2.96 *Dada una Red de Sistemas de Visitas Cíclicas (RSVC), conformada por dos Sistemas de Visitas Cíclicas (SVC), donde cada uno de ellos consta de dos colas tipo $M/M/1$. Los dos sistemas están comunicados entre sí por medio de la transferencia de usuarios entre las colas $Q_1 \leftrightarrow Q_3$ y $Q_2 \leftrightarrow Q_4$. Se definen los eventos para los procesos de arribos al tiempo t, $A_j(t) = \{0$ arribos en Q_j al tiempo $t\}$ para algún tiempo $t \geq 0$ y Q_j la cola j-ésima en la RSVC, para $j = 1,2,3,4$. Existe un intervalo $I \neq \emptyset$ tal que para $T^* \in I$, tal que $\mathbb{P}\{A_1(T^*), A_2(Tt^*), A_3(T^*), A_4(T^*) | T^* \in I\} > 0$.*

Demostración 37.2.1 *Sin pérdida de generalidad podemos considerar como base del análisis a la cola Q_1 del primer sistema que conforma la RSVC.*

Sea $n \geq 1$, ciclo en el primer sistema en el que se sabe que $L_j(\overline{\tau}_1(n)) = 0$, pues la política de servicio con que atienden los servidores es la exhaustiva. Como es sabido, para trasladarse a la siguiente cola, el servidor incurre en un tiempo de traslado $r_1(n) > 0$, entonces tenemos que $\tau_2(n) = \overline{\tau}_1(n) + r_1(n)$.

Definamos el intervalo $I_1 \equiv [\overline{\tau}_1(n), \tau_2(n)]$ de longitud $\xi_1 = r_1(n)$.

Dado que los tiempos entre arribo son exponenciales con tasa $\tilde{\mu}_1 = \mu_1 + \hat{\mu}_1$ (μ_1 son los arribos a Q_1 por primera vez al sistema, mientras que $\hat{\mu}_1$ son los arribos de traslado procedentes de Q_3) se tiene que la probabilidad del evento $A_1(t)$ está dada por

$$\mathbb{P}\{A_1(t) | t \in I_1(n)\} = e^{-\tilde{\mu}_1 \xi_1(n)}. \tag{37.2.165}$$

Por otra parte, para la cola Q_2 el tiempo $\overline{\tau}_2(n-1)$ es tal que $L_2(\overline{\tau}_2(n-1)) = 0$, es decir, es el tiempo en que la cola queda totalmente vacía en el ciclo anterior a n.

Entonces tenemos un sgundo intervalo $I_2 \equiv [\overline{\tau}_2(n-1), \tau_2(n)]$. Por lo tanto la probabilidad del evento $A_2(t)$ tiene probabilidad dada por

$$\mathbb{P}\{A_2(t) | t \in I_2(n)\} = e^{-\tilde{\mu}_2 \xi_2(n)}, \tag{37.2.166}$$

$$\xi_2(n) = \tau_2(n) - \overline{\tau}_2(n-1) \tag{37.2.167}$$

Ahora, dado que $I_1(n) \subset I_2(n)$, se tiene que

$$\begin{aligned}\xi_1(n) \leq \xi_2(n) &\Leftrightarrow -\xi_1(n) \geq -\xi_2(n)\\ -\tilde{\mu}_2\xi_1(n) \geq -\tilde{\mu}_2\xi_2(n) &\Leftrightarrow e^{-\tilde{\mu}_2\xi_1(n)} \geq e^{-\tilde{\mu}_2\xi_2(n)}\\ \mathbb{P}\{A_2(t) | t \in I_1(n)\} &\geq \mathbb{P}\{A_2(t) | t \in I_2(n)\}.\end{aligned}$$

Entonces se tiene que

$$\begin{aligned}\mathbb{P}\{A_1(t), A_2(t) | t \in I_1(n)\} &= \mathbb{P}\{A_1(t) | t \in I_1(n)\}\mathbb{P}\{A_2(t) | t \in I_1(n)\}\\ &\geq \mathbb{P}\{A_1(t) | t \in I_1(n)\}\mathbb{P}\{A_2(t) | t \in I_2(n)\}\\ &= e^{-\tilde{\mu}_1\xi_1(n)}e^{-\tilde{\mu}_2\xi_2(n)} = e^{-[\tilde{\mu}_1\xi_1(n)+\tilde{\mu}_2\xi_2(n)]}.\end{aligned}$$

Es decir,

$$\mathbb{P}\{A_1(t), A_2(t) | t \in I_1(n)\} = e^{-[\tilde{\mu}_1\xi_1(n)+\tilde{\mu}_2\xi_2(n)]} > 0. \tag{37.2.168}$$

En lo que respecta a la relación entre los dos SVC que conforman la RSVC para algún $m \geq 1$ se tiene que $\tau_3(m) < \tau_2(n) < \tau_4(m)$ por lo tanto se cumple cualquiera de los siguientes cuatro casos

a) $\tau_3(m) < \tau_2(n) < \overline{\tau}_3(m)$

b) $\overline{\tau}_3(m) < \tau_2(n) < \tau_4(m)$

c) $\tau_4(m) < \tau_2(n) < \overline{\tau}_4(m)$

d) $\overline{\tau}_4(m) < \tau_2(n) < \tau_3(m+1)$

Sea el intervalo $I_3(m) \equiv [\tau_3(m), \overline{\tau}_3(m)]$ *tal que* $\tau_2(n) \in I_3(m)$*, con longitud de intervalo* $\xi_3 \equiv \overline{\tau}_3(m) - \tau_3(m)$*, entonces se tiene que para* Q_3

$$\mathbb{P}\{A_3(t) | t \in I_3(m)\} = e^{-\tilde{\mu}_3 \xi_3(m)}. \tag{37.2.169}$$

mientras que para Q_4 *consideremos el intervalo* $I_4(m) \equiv [\tau_4(m-1), \overline{\tau}_3(m)]$*, entonces por construcción* $I_3(m) \subset I_4(m)$*, por lo tanto*

$$\begin{aligned} \xi_3(m) \leq \xi_4(m) &\Leftrightarrow -\xi_3(m) \geq -\xi_4(m) \\ -\tilde{\mu}_4 \xi_3(m) \geq -\tilde{\mu}_4 \xi_4(m) &\Leftrightarrow e^{-\tilde{\mu}_4 \xi_3(m)} \geq e^{-\tilde{\mu}_4 \xi_4(n)} \\ \mathbb{P}\{A_4(t) | t \in I_3(m)\} &\geq \mathbb{P}\{A_4(t) | t \in I_4(m)\}. \end{aligned}$$

Entonces se tiene que

$$\begin{aligned} \mathbb{P}\{A_3(t), A_4(t) | t \in I_3(m)\} &= \mathbb{P}\{A_3(t) | t \in I_3(m)\} \mathbb{P}\{A_4(t) | t \in I_3(m)\} \\ &\geq \mathbb{P}\{A_3(t) | t \in I_3(m)\} \mathbb{P}\{A_4(t) | t \in I_4(m)\} \\ &= e^{-\tilde{\mu}_3 \xi_3(m)} e^{-\tilde{\mu}_4 \xi_4(m)} = e^{-(\tilde{\mu}_3 \xi_3(m) + \tilde{\mu}_4 \xi_4(m))}. \end{aligned}$$

Es decir,

$$\mathbb{P}\{A_3(t), A_4(t) | t \in I_3(m)\} \geq e^{-(\tilde{\mu}_3 \xi_3(m) + \tilde{\mu}_4 \xi_4(m))} > 0. \tag{37.2.170}$$

Sea el intervalo $I_3(m) \equiv [\overline{\tau}_3(m), \tau_4(m)]$ *con longitud* $\xi_3 \equiv \tau_4(m) - \overline{\tau}_3(m)$*, entonces se tiene que para* Q_3

$$\mathbb{P}\{A_3(t) | t \in I_3(m)\} = e^{-\tilde{\mu}_3 \xi_3(m)}. \tag{37.2.171}$$

mientras que para Q_4 *consideremos el intervalo* $I_4(m) \equiv [\overline{\tau}_4(m-1), \tau_4(m)]$*, entonces por construcción* $I_3(m) \subset I_4(m)$*, y al igual que en el caso anterior se tiene que*

$$\begin{aligned} \xi_3(m) \leq \xi_4(m) &\Leftrightarrow -\xi_3(m) \geq -\xi_4(m) \\ -\tilde{\mu}_4 \xi_3(m) \geq -\tilde{\mu}_4 \xi_4(m) &\Leftrightarrow e^{-\tilde{\mu}_4 \xi_3(m)} \geq e^{-\tilde{\mu}_4 \xi_4(n)} \\ \mathbb{P}\{A_4(t) | t \in I_3(m)\} &\geq \mathbb{P}\{A_4(t) | t \in I_4(m)\}. \end{aligned}$$

Entonces se tiene que

$$\begin{aligned} \mathbb{P}\{A_3(t), A_4(t) | t \in I_3(m)\} &= \mathbb{P}\{A_3(t) | t \in I_3(m)\} \mathbb{P}\{A_4(t) | t \in I_3(m)\} \\ &\geq \mathbb{P}\{A_3(t) | t \in I_3(m)\} \mathbb{P}\{A_4(t) | t \in I_4(m)\} \\ &= e^{-\tilde{\mu}_3 \xi_3(m)} e^{-\tilde{\mu}_4 \xi_4(m)} = e^{-(\tilde{\mu}_3 \xi_3(m) + \tilde{\mu}_4 \xi_4(m))}. \end{aligned}$$

Es decir,

$$\mathbb{P}\{A_3(t), A_4(t) | t \in I_4(m)\} \geq e^{-(\tilde{\mu}_3 + \tilde{\mu}_4) \xi_3(m)} > 0. \tag{37.2.172}$$

Para el intervalo $I_3(m) = [\tau_4(m), \overline{\tau}_4(m)]$*, se tiene que este caso es análogo al caso (a).*

Para el intevalo $I_3(m) \equiv [\overline{\tau}_4(m), \tau_4(m+1)]$*, se tiene que es análogo al caso (b).*

Por construcción se tiene que $I(n,m) \equiv I_1(n) \cap I_3(m) \neq \emptyset$*,entonces en particular se tienen las contenciones* $I(n,m) \subseteq I_1(n)$ *y* $I(n,m) \subseteq I_3(m)$*, por lo tanto si definimos* $\xi_{n,m} \equiv \ell(I(n,m))$ *tenemos que*

$$\begin{gathered} \xi_{n,m} \leq \xi_1(n) \ \ y \ \xi_{n,m} \leq \xi_3(m) \ \ entonces \\ -\xi_{n,m} \geq -\xi_1(n) \ \ y \ -\xi_{n,m} \leq -\xi_3(m) \end{gathered}$$

por lo tanto tenemos las desigualdades

$$\begin{array}{ll} -\tilde{\mu}_1\xi_{n,m} \geq -\tilde{\mu}_1\xi_1(n), & -\tilde{\mu}_2\xi_{n,m} \geq -\tilde{\mu}_2\xi_1(n) \geq -\tilde{\mu}_2\xi_2(n), \\ -\tilde{\mu}_3\xi_{n,m} \geq -\tilde{\mu}_3\xi_3(m), & -\tilde{\mu}_4\xi_{n,m} \geq -\tilde{\mu}_4\xi_3(m) \geq -\tilde{\mu}_4\xi_4(m). \end{array}$$

Sea $T^* \in I(n,m)$, entonces dado que en particular $T^* \in I_1(n)$, se cumple con probabilidad positiva que no hay arribos a las colas Q_1 y Q_2, en consecuencia, tampoco hay usuarios de transferencia para Q_3 y Q_4, es decir, $\tilde{\mu}_1 = \mu_1$, $\tilde{\mu}_2 = \mu_2$, $\tilde{\mu}_3 = \mu_3$, $\tilde{\mu}_4 = \mu_4$, es decir, los eventos Q_1 y Q_3 son condicionalmente independientes en el intervalo $I(n,m)$; lo mismo ocurre para las colas Q_2 y Q_4, por lo tanto tenemos que

$$\begin{array}{l} \mathbb{P}\{A_1(T^*), A_2(T^*), A_3(T^*), A_4(T^*) | T^* \in I(n,m)\} \\ = \prod_{j=1}^{4} \mathbb{P}\{A_j(T^*) | T^* \in I(n,m)\} \\ \geq \mathbb{P}\{A_1(T^*) | T^* \in I_1(n)\} \mathbb{P}\{A_2(T^*) | T^* \in I_2(n)\} \\ \mathbb{P}\{A_3(T^*) | T^* \in I_3(m)\} \mathbb{P}\{A_4(T^*) | T^* \in I_4(m)\} \\ = e^{-\mu_1\xi_1(n)} e^{-\mu_2\xi_2(n)} e^{-\mu_3\xi_3(m)} e^{-\mu_4\xi_4(m)} \\ = e^{-[\tilde{\mu}_1\xi_1(n)+\tilde{\mu}_2\xi_2(n)+\tilde{\mu}_3\xi_3(m)+\tilde{\mu}_4\xi_4(m)]} > 0. \end{array} \tag{37.2.173}$$

Ahora solo resta demostrar que para $n \geq 1$, existe $m \geq 1$ tal que se cumplen cualquiera de los cuatro casos arriba mencionados:

a) $\tau_3(m) < \tau_2(n) < \overline{\tau}_3(m)$

b) $\overline{\tau}_3(m) < \tau_2(n) < \tau_4(m)$

c) $\tau_4(m) < \tau_2(n) < \overline{\tau}_4(m)$

d) $\overline{\tau}_4(m) < \tau_2(n) < \tau_3(m+1)$

Consideremos nuevamente el primer caso. Supongamos que no existe $m \geq 1$, tal que $I_1(n) \cap I_3(m) \neq \emptyset$, es decir, para toda $m \geq 1$, $I_1(n) \cap I_3(m) = \emptyset$, entonces se tiene que ocurren cualquiera de los dos casos

a) $\tau_2(n) \leq \tau_3(m)$*: Recordemos que $\tau_2(m) = \overline{\tau}_1 + r_1(m)$ donde cada una de las variables aleatorias son tales que $\mathbb{E}[\overline{\tau}_1(n) - \tau_1(n)] < \infty$, $\mathbb{E}[R_1] < \infty$ y $\mathbb{E}[\tau_3(m)] < \infty$, lo cual contradice el hecho de que no exista un ciclo $m \geq 1$ que satisfaga la condición deseada.*

b) $\tau_2(n) \geq \overline{\tau}_3(m)$*: por un argumento similar al anterior se tiene que no es posible que no exista un ciclo $m \geq 1$ tal que satisaface la condición deseada.*

Para el resto de los casos la demostración es análoga. Por lo tanto, se tiene que efectivamente existe $m \geq 1$ tal que $\tau_3(m) < \tau_2(n) < \tau_4(m)$.

En Sigman, Thorison y Wolff [40] prueban que para la existencia de un una sucesión infinita no decreciente de tiempos de regeneración $\tau_1 \leq \tau_2 \leq \cdots$ en los cuales el proceso se regenera, basta un tiempo de regeneración R_1, donde $R_j = \tau_j - \tau_{j-1}$. Para tal efecto se requiere la existencia de un espacio de probabilidad $(\Omega, \mathcal{F}, \mathbb{P})$, y proceso estocástico $X = \{X(t) : t \geq 0\}$ con espacio de estados $(S, \mathcal{R})$, con $\mathcal{R}$ σ-álgebra.

Proposición 37.2.67 *Si existe una variable aleatoria no negativa R_1 tal que $\theta_{R1} X =_D X$, entonces $(\Omega, \mathcal{F}, \mathbb{P})$ puede extenderse para soportar una sucesión estacionaria de variables aleatorias $R = \{R_k : k \geq 1\}$, tal que para $k \geq 1$,*

$$\theta_k (X, R) =_D (X, R).$$

Además, para $k \geq 1$, $\theta_k R$ es condicionalmente independiente de $(X, R_1, \ldots, R_k)$, dado $\theta_{\tau k} X$.

- Doob en 1953 demostró que el estado estacionario de un proceso de partida en un sistema de espera $M/G/\infty$, es Poisson con la misma tasa que el proceso de arribos.
- Burke en 1968, fue el primero en demostrar que el estado estacionario de un proceso de salida de una cola $M/M/s$ es un proceso Poisson.
- Disney en 1973 obtuvo el siguiente resultado:

  Teorema 37.2.97 *Para el sistema de espera $M/G/1/L$ con disciplina FIFO, el proceso $\boldsymbol{I}$ es un proceso de renovación si y sólo si el proceso denominado longitud de la cola es estacionario y se cumple cualquiera de los siguientes casos:*

  a) Los tiempos de servicio son identicamente cero;
  b) $L = 0$, para cualquier proceso de servicio S;
  c) $L = 1$ y $G = D$;
  d) $L = \infty$ y $G = M$.

  En estos casos, respectivamente, las distribuciones de interpartida $P\{T_{n+1} - T_n \leq t\}$ son

  a) $1 - e^{-\lambda t}$, $t \geq 0$;
  b) $1 - e^{-\lambda t} * F(t)$, $t \geq 0$;
  c) $1 - e^{-\lambda t} * \mathbb{1}_d(t)$, $t \geq 0$;
  d) $1 - e^{-\lambda t} * F(t)$, $t \geq 0$.

- Finch (1959) mostró que para los sistemas $M/G/1/L$, con $1 \leq L \leq \infty$ con distribuciones de servicio dos veces diferenciable, solamente el sistema $M/M/1/\infty$ tiene proceso de salida de renovación estacionario.
- King (1971) demostro que un sistema de colas estacionario $M/G/1/1$ tiene sus tiempos de interpartida sucesivas D_n y D_{n+1} son independientes, si y sólo si, $G = D$, en cuyo caso le proceso de salida es de renovación.
- Disney (1973) demostró que el único sistema estacionario $M/G/1/L$, que tiene proceso de salida de renovación son los sistemas $M/M/1$ y $M/D/1/1$.
- El siguiente resultado es de Disney y Koning (1985)

  Teorema 37.2.98 *En un sistema de espera $M/G/s$, el estado estacionario del proceso de salida es un proceso Poisson para cualquier distribución de los tiempos de servicio si el sistema tiene cualquiera de las siguientes cuatro propiedades.*

  a) $s = \infty$
  b) La disciplina de servicio es de procesador compartido.
  c) La disciplina de servicio es LCFS y preemptive resume, esto se cumple para $L < \infty$
  d) $G = M$.

- El siguiente resultado es de Alamatsaz (1983)

  Teorema 37.2.99 *En cualquier sistema de colas $GI/G/1/L$ con $1 \leq L < \infty$ y distribución de interarribos A y distribución de los tiempos de servicio B, tal que $A(0) = 0$, $A(t)(1 - B(t)) > 0$ para alguna $t > 0$ y $B(t)$ para toda $t > 0$, es imposible que el proceso de salida estacionario sea de renovación.*

Definición 37.2.151 (Definición Clásica) *Un proceso estocástico $X = \{X(t) : t \geq 0\}$ es llamado regenerativo is existe una variable aleatoria $R_1 > 0$ tal que*

i) $\{X(t + R_1) : t \geq 0\}$ es independiente de $\{\{X(t) : t < R_1\},\}$
ii) $\{X(t + R_1) : t \geq 0\}$ es estocásticamente equivalente a $\{X(t) : t > 0\}$

Llamamos a R_1 tiempo de regeneración, y decimos que X se regenera en este punto.

$\{X(t + R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Nota 37.2.79 *La existencia de un primer tiempo de regeneración, R_1, implica la existencia de una sucesión completa de estos tiempos $R_1, R_2 \ldots$, que satisfacen la propiedad deseada [40].*

Nota 37.2.80 *Para la cola $GI/GI/1$ los usuarios arriban con tiempos t_n y son atendidos con tiempos de servicio S_n, los tiempos de arribo forman un proceso de renovación con tiempos entre arribos independientes e identicamente distribuidos (`i.i.d.`)$T_n = t_n - t_{n-1}$, además los tiempos de servicio son `i.i.d.` e independientes de los procesos de arribo. Por estable se entiende que $\mathbb{E}S_n < \mathbb{E}T_n < \infty$.*

Definición 37.2.152 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t} \int_0^\infty X(u)\, du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t} \int_0^\infty I_x(u)\, du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\, dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.2.81 *Funciones de procesos regenerativos son regenerativas, es decir, si $X(t)$ es regenerativo y se define el proceso $Y(t)$ por $Y(t) = f(X(t))$ para alguna función Borel medible $f(\cdot)$. Además Y es regenerativo con los mismos tiempos de renovación que X.*

En general, los tiempos de renovación, Z_k de un proceso regenerativo no requieren ser tiempos de paro con respecto a la evolución de $X(t)$.

Nota 37.2.82 *Una función de un proceso de Markov, usualmente no será un proceso de Markov, sin embargo será regenerativo si el proceso de Markov lo es.*

Nota 37.2.83 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Nota 37.2.84
a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.
b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\{V(t-s) \in A | X_1 > t - s\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones (*puntos de regeneración*) que ocurren en $[0, t]$. El intervalo $[0, X_1)$ es llamado *primer ciclo de regeneración* de $\{V(t), t \geq 0\}$, $[X_1, X_1 + X_2)$ el *segundo ciclo de regeneración*, y así sucesivamente.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 37.2.153 *Se define el proceso estacionario, $\{V^*(t), t \geq 0\}$, para $\{V(t), t \geq 0\}$ por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]} \int_0^\infty \mathbb{P}\{V(t+x) \in A | X > x\}(1 - F(x))\, dx,$$

para todo $t \geq 0$ y todo conjunto de Borel A.

Definición 37.2.154 *Una distribución se dice que es* aritmética *si todos sus puntos de incremento son múltiplos de la forma $0, \lambda, 2\lambda, \ldots$ para alguna $\lambda > 0$ entera.*

Definición 37.2.155 *Una modificación medible de un proceso $\{V(t), t \geq 0\}$, es una versión de este, $\{V(t, w)\}$ conjuntamente medible para $t \geq 0$ y para $w \in S$, S espacio de estados para $\{V(t), t \geq 0\}$.*

Teorema 37.2.100 *Sea $\{V(t), t \geq\}$ un proceso regenerativo no negativo con modificación medible. Sea $\mathbb{E}[X] < \infty$. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de t, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$, equivalentemente, si $\mathbb{E}\left[\int_0^X V(s)\,ds\right] < \infty$,entonces

$$\frac{\int_0^t V(s)\,ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$.

Corolario 37.2.48 *Sea $\{V(t), t \geq 0\}$ un proceso regenerativo no negativo, con modificación medible. Si $\mathbb{E} < \infty$, F es no-aritmética, y para todo $x \geq 0$, $P\{V(t) \leq x, C > x\}$ es de variación acotada como función de t en cada intervalo finito $[0, \tau]$, entonces $V(t)$ converge en distribución cuando $t \to \infty$ y*

$$\mathbb{E}V = \frac{\mathbb{E}\int_0^X V(s)\,ds}{\mathbb{E}X}$$

Donde V tiene la distribución límite de $V(t)$ cuando $t \to \infty$.

Para el caso discreto se tienen resultados similares.

Definición 37.2.156 *Sean $0 \leq T_1 \leq T_2 \leq \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0, t)$ es*

$$N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t), \tag{37.2.174}$$

para $t \geq 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.2.157 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \geq 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0, t)$*

Nota 37.2.85 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^{n} \xi_k$ y $N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes NÃºmeros.*

Nota 37.2.86 *Una función $h : \mathbb{R}_+ \to \mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ es decreciente y Riemann Integrable.

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)| \leq b(t)$, donde b es DRI.

Teorema 37.2.101 (Teorema Principal de Renovación) *Si F es no aritmética y $h(t)$ es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty} U \star h = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds.$$

Proposición 37.2.68 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t < 0$ puede expresarse como*

$$H(t) = U \star h(t), \text{ donde } h(t) = H(t) - F \star H(t)$$

Definición 37.2.158 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}\left[X(T+t)\,|T\right] = \mathbb{E}\left[X(t)\right], \text{ para } t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.2.69 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}\left[X(t)\right] = U \star h(t), \text{ donde } h(t) = \mathbb{E}\left[X(t)\,\mathbb{1}(T > t)\right].$$

Teorema 37.2.102 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M = \sup\{|X(t)| : t \leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}\left[X(t)\right] = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds,$$

donde $h(t) = \mathbb{E}\left[X(t)\,\mathbb{1}(T > t)\right]$.

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq \quad t &< T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}\left[N(t)\right] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.2.70 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Nota 37.2.87 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.2.103 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1}T_n = \mu, \text{ c.s.} \tag{37.2.175}$$

$$lim_{t\to\infty} t^{-1}N(t) = 1/\mu, \text{ c.s.} \tag{37.2.176}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.2.49 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1}N(t) \to 1/\mu, \text{ c.s. cuando } t \to \infty. \tag{37.2.177}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.2.159 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.2.104 *Supóngase que $n^{-1}T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \ c.s. \tag{37.2.178}$$

$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \ c.s. \tag{37.2.179}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.2.50 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \ c.s. \ cuando \ t \to \infty. \tag{37.2.180}$$

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq & \ t \ < T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.2.71 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Nota 37.2.88 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Definición 37.2.164 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t < 0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t) = h(t) + \int_{[0,t]} H(t-s)\, dF(s), \ t \geq 0, \tag{37.2.205}$$

donde $H(t)$ es una función de valores reales. Esto es $H = h + F \star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t < 0$.

Proposición 37.2.75 *La función $U \star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.2.113 (Teorema Renovación Elemental)

$$t^{-1} U(t) \to 1/\mu, \ cuando \ t \to \infty.$$

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.2.165 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t) = \sum_{n=1}^{\infty} F^{n\star}(t), \ t \geq 0,$$

donde $F^{0\star}(t) = \mathbb{1}(t \geq 0)$.

Proposición 37.2.76 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t > 0$, y es $U'(t) = \sum_{n=0}^{\infty} f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t) > N(t-)\} = 0, \ t \geq 0.$$

Definición 37.2.166 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha) = \int_{\mathbb{R}_+} e^{-\alpha t} dF(t), \ \alpha \geq 0.$$

Entonces

$$\hat{U}(\alpha) = \sum_{n=0}^{\infty} F^{\hat{n}\star}(\alpha) = \sum_{n=0}^{\infty} \hat{F}(\alpha)^n = \frac{1}{1-\hat{F}(\alpha)}.$$

Proposición 37.2.77 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha) = \frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.2.92 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)] = \lambda t$, para $t \geq 0$.*

Teorema 37.2.114 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t) = \mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f : \mathbb{R}_+ \to \mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()} f(T_n)\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista. Además si $X_1, X_2, \ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n | T_n = s] = f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)} X_n\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista.

Corolario 37.2.59 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right] = \mu \mathbb{E}[N(t)+1], \ t \geq 0,$$

Definición 37.2.167 *Sean $0 \leq T_1 \leq T_2 \leq \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0,t)$ es*

$$N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t), \tag{37.2.206}$$

para $t \geq 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.2.168 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \geq 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0,t)$*

Nota 37.2.93 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^{n} \xi_k$ y $N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes NÃºmeros.*

Definición 37.2.169 *Sean $0 \leq T_1 \leq T_2 \leq \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0,t)$ es*

$$N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t), \tag{37.2.207}$$

para $t \geq 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.2.170 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \geq 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0, t)$*

Nota 37.2.94 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^{n} \xi_k$ y $N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes Números.*

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq & \quad t \quad < T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.2.78 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Ejemplo 37.2.3 (Proceso Poisson) *Suponga que se tienen tiempos de inter-renovación i.i.d. del proceso de renovación $N(t)$ tienen distribución exponencial $F(t) = q - e^{-\lambda t}$ con tasa λ. Entonces $N(t)$ es un proceso Poisson con tasa λ.*

Nota 37.2.95 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.2.115 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{37.2.208}$$

$$lim_{t\to\infty} t^{-1} N(t) = 1/\mu, \ c.s. \tag{37.2.209}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.2.60 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1} N(t) \to 1/\mu, \ c.s. \ cuando \ t \to \infty. \tag{37.2.210}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.2.171 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.2.116 *Supóngase que $n^{-1}T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \text{ c.s.} \tag{37.2.211}$$

$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \text{ c.s.} \tag{37.2.212}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.2.61 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \text{ c.s. cuando } t \to \infty. \tag{37.2.213}$$

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.2.172 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t) = \sum_{n=1}^{\infty} F^{n\star}(t), \ t \geq 0,$$

donde $F^{0\star}(t) = \mathbb{1}(t \geq 0)$.

Proposición 37.2.79 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t > 0$, y es $U'(t) = \sum_{n=0}^{\infty} f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t) > N(t-)\} = 0, \ t \geq 0.$$

Definición 37.2.173 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha) = \int_{\mathbb{R}_+} e^{-\alpha t} dF(t), \ \alpha \geq 0.$$

Entonces

$$\hat{U}(\alpha) = \sum_{n=0}^{\infty} F^{\hat{n}\star}(\alpha) = \sum_{n=0}^{\infty} \hat{F}(\alpha)^n = \frac{1}{1 - \hat{F}(\alpha)}.$$

Proposición 37.2.80 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha) = \frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.2.96 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)] = \lambda t$, para $t \geq 0$.*

Teorema 37.2.117 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t) = \mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f : \mathbb{R}_+ \to \mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()} f(T_n)\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista. Además si $X_1, X_2, \ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n | T_n = s] = f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)} X_n\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista.

Corolario 37.2.62 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right] = \mu\mathbb{E}\left[N(t)+1\right],\ t \geq 0,$$

Definición 37.2.174 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t < 0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t) = h(t) + \int_{[0,t]} H(t-s)\, dF(s),\ t \geq 0, \tag{37.2.214}$$

donde $H(t)$ es una función de valores reales. Esto es $H = h + F \star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t < 0$.

Proposición 37.2.81 *La función $U \star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.2.118 (Teorema Renovación Elemental)

$$t^{-1}U(t) \to 1/\mu,\ \textit{cuando}\ t \to \infty.$$

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.2.175 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t) = \sum_{n=1}^{\infty} F^{n\star}(t),\ t \geq 0,$$

donde $F^{0\star}(t) = \mathbb{1}(t \geq 0)$.

Proposición 37.2.82 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t > 0$, y es $U^{'}(t) = \sum_{n=0}^{\infty} f^{n\star}(t)$. Además*

$$\mathbb{P}\left\{N(t) > N(t-)\right\} = 0,\ t \geq 0.$$

Definición 37.2.176 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha) = \int_{\mathbb{R}_+} e^{-\alpha t} dF(t),\ \alpha \geq 0.$$

Entonces

$$\hat{U}(\alpha) = \sum_{n=0}^{\infty} F^{\hat{n}\star}(\alpha) = \sum_{n=0}^{\infty} \hat{F}(\alpha)^n = \frac{1}{1-\hat{F}(\alpha)}.$$

Proposición 37.2.83 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha) = \frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.2.97 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}\left[U(t)\right] = \lambda t$, para $t \geq 0$.*

Teorema 37.2.119 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t) = \mathbb{E}\left[N()\right]$ es finita para cada t. Entonces para cualquier función $f : \mathbb{R}_+ \to \mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()} f(T_n)\right] = \int_{(0,t]} f(s)\, d\eta(s),\ t \geq 0,$$

suponiendo que la integral exista. Además si $X_1, X_2, \ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}\left[X_n | T_n = s\right] = f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)} X_n\right] = \int_{(0,t]} f(s)\, d\eta(s),\ t \geq 0,$$

suponiendo que la integral exista.

Corolario 37.2.63 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right] = \mu\mathbb{E}\left[N(t)+1\right], \; t \geq 0,$$

Definición 37.2.177 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t < 0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t) = h(t) + \int_{[0,t]} H(t-s)\, dF(s), \; t \geq 0, \tag{37.2.215}$$

donde $H(t)$ es una función de valores reales. Esto es $H = h + F \star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t < 0$.

Proposición 37.2.84 *La función $U \star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.2.120 (Teorema Renovación Elemental)

$$t^{-1}U(t) \to 1/\mu, \text{ cuando } t \to \infty.$$

Nota 37.2.98 *Una función $h : \mathbb{R}_+ \to \mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ es decreciente y Riemann Integrable.

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)| \leq b(t)$, donde b es DRI.

Teorema 37.2.121 (Teorema Principal de Renovación) *Si F es no aritmética y $h(t)$ es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty} U \star h = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\, ds.$$

Proposición 37.2.85 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t < 0$ puede expresarse como*

$$H(t) = U \star h(t), \text{ donde } h(t) = H(t) - F \star H(t)$$

Definición 37.2.178 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}\left[X(T+t)\,|T\right] = \mathbb{E}\left[X(t)\right], \text{ para } t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.2.86 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}\left[X(t)\right] = U \star h(t), \text{ donde } h(t) = \mathbb{E}\left[X(t)\, 1\!\!1\,(T > t)\right].$$

Teorema 37.2.122 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M = \sup\{|X(t)| : t \leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}\left[X(t)\right] = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\, ds,$$

donde $h(t) = \mathbb{E}\left[X(t)\, 1\!\!1\,(T > t)\right]$.

Nota 37.2.99 *Una función $h : \mathbb{R}_+ \to \mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ es decreciente y Riemann Integrable.

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)| \leq b(t)$, donde b es DRI.

Teorema 37.2.123 (Teorema Principal de Renovación) *Si F es no aritmética y $h(t)$ es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty} U \star h = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\, ds.$$

Proposición 37.2.87 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t<0$ puede expresarse como*

$$H(t) = U \star h(t), \text{ donde } h(t) = H(t) - F \star H(t)$$

Definición 37.2.179 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}[X(T+t)|T] = \mathbb{E}[X(t)], \text{ para } t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.2.88 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}[X(t)] = U \star h(t), \text{ donde } h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T>t)].$$

Teorema 37.2.124 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M = \sup\{|X(t)| : t \leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}[X(t)] = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds,$$

donde $h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T>t)]$.

Definición 37.2.180 *Para el proceso $\{(N(t), X(t)) : t \geq 0\}$, sus trayectoria muestrales en el intervalo de tiempo $[T_{n-1}, T_n)$ están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1}+t) : 0 \leq t < \xi_n\})$$

Este ζ_n es el n-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos T_n si sus segmentos ζ_n son independientes e idénticamennte distribuidos.

Nota 37.2.100 *Si $\tilde{X}(t)$ con espacio de estados $\tilde{S}$ es regenerativo sobre T_n, entonces $X(t) = f\left(\tilde{X}(t)\right)$ también es regenerativo sobre T_n, para cualquier función $f : \tilde{S} \to S$.*

Nota 37.2.101 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Nota 37.2.102 *Un proceso estocástico a tiempo continuo o discreto es regenerativo si existe un proceso de renovación tal que los segmentos del proceso entre tiempos de renovación sucesivos son i.i.d., es decir, para $\{X(t) : t \geq 0\}$ proceso estocástico a tiempo continuo con espacio de estados S, espacio métrico.*

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Definición 37.2.181 *Para el proceso $\{(N(t), X(t)) : t \geq 0\}$, sus trayectoria muestrales en el intervalo de tiempo $[T_{n-1}, T_n)$ están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1}+t) : 0 \leq t < \xi_n\})$$

Este ζ_n es el n-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos T_n si sus segmentos ζ_n son independientes e idénticamennte distribuidos.

Nota 37.2.103 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Teorema 37.2.125 (Procesos Regenerativos) *Suponga que el proceso*

Definición 37.2.182 (Renewal Process Trinity) *Para un proceso de renovación $N(t)$, los siguientes procesos proveen de información sobre los tiempos de renovación.*

- *$A(t) = t - T_{N(t)}$, el tiempo de recurrencia hacia atrás al tiempo t, que es el tiempo desde la última renovación para t.*
- *$B(t) = T_{N(t)+1} - t$, el tiempo de recurrencia hacia adelante al tiempo t, residual del tiempo de renovación, que es el tiempo para la próxima renovación después de t.*
- *$L(t) = \xi_{N(t)+1} = A(t) + B(t)$, la longitud del intervalo de renovación que contiene a t.*

Nota 37.2.104 *El proceso tridimensional* $(A(t), B(t), L(t))$ *es regenerativo sobre* T_n*, y por ende cada proceso lo es. Cada proceso* $A(t)$ *y* $B(t)$ *son procesos de MArkov a tiempo continuo con trayectorias continuas por partes en el espacio de estados* $\mathbb{R}_+$*. Una expresión conveniente para su distribución conjunta es, para* $0 \leq x < t, y \geq 0$

$$P\{A(t) > x, B(t) > y\} = P\{N(t+y) - N((t-x)) = 0\} \tag{37.2.216}$$

Ejemplo 37.2.4 (Tiempos de recurrencia Poisson) *Si* $N(t)$ *es un proceso Poisson con tasa* λ*, entonces de la expresión (37.8.10) se tiene que*

$$P\{A(t) > x, B(t) > y\} = e^{-\lambda(x+y)}, \quad 0 \leq x < t, y \geq 0,$$

que es la probabilidad Poisson de no renovaciones en un intervalo de longitud $x + y$*.*

Nota 37.2.105 *Una cadena de Markov ergódica tiene la propiedad de ser estacionaria si la distribución de su estado al tiempo* 0 *es su distribución estacionaria.*

Definición 37.2.183 *Un proceso estocástico a tiempo continuo* $\{X(t) : t \geq 0\}$ *en un espacio general es estacionario si sus distribuciones finito dimensionales son invariantes bajo cualquier traslado: para cada* $0 \leq s_1 < s_2 < \cdots < s_k$ *y* $t \geq 0$*,*

$$(X(s_1 + t), \ldots, X(s_k + t)) =_d (X(s_1), \ldots, X(s_k)).$$

Nota 37.2.106 *Un proceso de Markov es estacionario si* $X(t) =_d X(0)$*,* $t \geq 0$*.*

Considerese el proceso $N(t) = \sum_n 1\!\!1(\tau_n \leq t)$ en $\mathbb{R}_+$, con puntos $0 < \tau_1 < \tau_2 < \cdots$.

Proposición 37.2.89 *Si* N *es un proceso puntual estacionario y* $\mathbb{E}[N(1)] < \infty$*, entonces* $\mathbb{E}[N(t)] = t\mathbb{E}[N(1)]$*,* $t \geq 0$

Teorema 37.2.126 *Los siguientes enunciados son equivalentes*

i) *El proceso retardado de renovación* N *es estacionario.*

ii) *EL proceso de tiempos de recurrencia hacia adelante* $B(t)$ *es estacionario.*

iii) $\mathbb{E}[N(t)] = t/\mu$*,*

iv) $G(t) = F_e(t) = \frac{1}{\mu}\int_0^t [1 - F(s)]\, ds$

Cuando estos enunciados son ciertos, $P\{B(t) \leq x\} = F_e(x)$*, para* $t, x \geq 0$*.*

Nota 37.2.107 *Una consecuencia del teorema anterior es que el Proceso Poisson es el único proceso sin retardo que es estacionario.*

Corolario 37.2.64 *El proceso de renovación* $N(t)$ *sin retardo, y cuyos tiempos de inter renonación tienen media finita, es estacionario si y sólo si es un proceso Poisson.*

Nota 37.2.108 *Si* $\tilde{X}(t)$ *con espacio de estados* $\tilde{S}$ *es regenerativo sobre* T_n*, entonces* $X(t) = f\left(\tilde{X}(t)\right)$ *también es regenerativo sobre* T_n*, para cualquier función* $f : \tilde{S} \to S$*.*

Nota 37.2.109 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Definición 37.2.184 (Definición Clásica) *Un proceso estocástico* $X = \{X(t) : t \geq 0\}$ *es llamado regenerativo is existe una variable aleatoria* $R_1 > 0$ *tal que*

i) $\{X(t + R_1) : t \geq 0\}$ *es independiente de* $\{\{X(t) : t < R_1\},\}$

ii) $\{X(t + R_1) : t \geq 0\}$ *es estocásticamente equivalente a* $\{X(t) : t > 0\}$

Llamamos a R_1 *tiempo de regeneración, y decimos que* X *se regenera en este punto.*

$\{X(t + R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Definición 37.2.185 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty X(u)\,du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty I_x(u)\,du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\,dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.2.110 *a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.*

b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Definición 37.2.186 *Para el proceso $\{(N(t), X(t)) : t \geq 0\}$, sus trayectoria muestrales en el intervalo de tiempo $[T_{n-1}, T_n)$ están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1} + t) : 0 \leq t < \xi_n\})$$

Este ζ_n es el n-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos T_n si sus segmentos ζ_n son independientes e idénticamennte distribuidos.

Nota 37.2.111 *Si $\tilde{X}(t)$ con espacio de estados $\tilde{S}$ es regenerativo sobre T_n, entonces $X(t) = f\left(\tilde{X}(t)\right)$ también es regenerativo sobre T_n, para cualquier función $f : \tilde{S} \to S$.*

Nota 37.2.112 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Definición 37.2.187 (Definición Clásica) *Un proceso estocástico $X = \{X(t) : t \geq 0\}$ es llamado regenerativo is existe una variable aleatoria $R_1 > 0$ tal que*

i) $\{X(t + R_1) : t \geq 0\}$ es independiente de $\{\{X(t) : t < R_1\},\}$

ii) $\{X(t + R_1) : t \geq 0\}$ es estocásticamente equivalente a $\{X(t) : t > 0\}$

Llamamos a R_1 tiempo de regeneración, y decimos que X se regenera en este punto.

$\{X(t + R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Nota 37.2.113 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Definición 37.2.188 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty X(u)\,du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty I_x(u)\,du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\,dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.2.114 *a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.*

b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\{V(t-s) \in A | X_1 > t - s\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones (*puntos de regeneración*) que ocurren en $[0, t]$. El intervalo $[0, X_1)$ es llamado *primer ciclo de regeneración* de $\{V(t), t \geq 0\}$, $[X_1, X_1 + X_2)$ el *segundo ciclo de regeneración*, y así sucesivamente.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 37.2.189 *Se define el proceso estacionario, $\{V^*(t), t \geq 0\}$, para $\{V(t), t \geq 0\}$ por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]} \int_0^\infty \mathbb{P}\{V(t+x) \in A | X > x\}(1 - F(x))\,dx,$$

para todo $t \geq 0$ y todo conjunto de Borel A.

Definición 37.2.190 *Una distribución se dice que es* aritmética *si todos sus puntos de incremento son múltiplos de la forma $0, \lambda, 2\lambda, \ldots$ para alguna $\lambda > 0$ entera.*

Definición 37.2.191 *Una modificación medible de un proceso $\{V(t), t \geq 0\}$, es una versión de este, $\{V(t, w)\}$ conjuntamente medible para $t \geq 0$ y para $w \in S$, S espacio de estados para $\{V(t), t \geq 0\}$.*

Teorema 37.2.127 *Sea $\{V(t), t \geq\}$ un proceso regenerativo no negativo con modificación medible. Sea $\mathbb{E}[X] < \infty$. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de t, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$, equivalentemente, si $\mathbb{E}\left[\int_0^X V(s)\,ds\right] < \infty$,entonces

$$\frac{\int_0^t V(s)\,ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$.

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\{V(t-s) \in A | X_1 > t - s\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones (*puntos de regeneración*) que ocurren en $[0, t]$. El intervalo $[0, X_1)$ es llamado *primer ciclo de regeneración* de $\{V(t), t \geq 0\}$, $[X_1, X_1 + X_2)$ el *segundo ciclo de regeneración*, y así sucesivamente.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 37.2.192 *Se define el proceso estacionario,* $\{V^*(t), t \geq 0\}$*, para* $\{V(t), t \geq 0\}$ *por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]} \int_0^\infty \mathbb{P}\{V(t+x) \in A | X > x\} (1 - F(x))\, dx,$$

para todo $t \geq 0$ *y todo conjunto de Borel* A*.*

Definición 37.2.193 *Una distribución se dice que es* aritmética *si todos sus puntos de incremento son múltiplos de la forma* $0, \lambda, 2\lambda, \ldots$ *para alguna* $\lambda > 0$ *entera.*

Definición 37.2.194 *Una modificación medible de un proceso* $\{V(t), t \geq 0\}$*, es una versión de este,* $\{V(t,w)\}$ *conjuntamente medible para* $t \geq 0$ *y para* $w \in S$*,* S *espacio de estados para* $\{V(t), t \geq 0\}$*.*

Teorema 37.2.128 *Sea* $\{V(t), t \geq\}$ *un proceso regenerativo no negativo con modificación medible. Sea* $\mathbb{E}[X] < \infty$*. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de* t*, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\, ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$*, equivalentemente, si* $\mathbb{E}\left[\int_0^X V(s)\, ds\right] < \infty$*,entonces*

$$\frac{\int_0^t V(s)\, ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\, ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$*.*

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Sean $T_1, T_2, \ldots$ los puntos donde las longitudes de las colas de la red de sistemas de visitas cíclicas son cero simultáneamente, cuando la cola Q_j es visitada por el servidor para dar servicio, es decir, $L_1(T_i) = 0, L_2(T_i) = 0, \hat{L}_1(T_i) = 0$ y $\hat{L}_2(T_i) = 0$, a estos puntos se les denominará puntos regenerativos. Sea la función generadora de momentos para L_i, el número de usuarios en la cola $Q_i(z)$ en cualquier momento, está dada por el tiempo promedio de $z^{L_i(t)}$ sobre el ciclo regenerativo definido anteriormente:

$$Q_i(z) = \mathbb{E}\left[z^{L_i(t)}\right] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i} \sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}\left[\sum_{m=1}^{M_i} \tau_i(m+1) - \tau_i(m)\right]}$$

M_i es un tiempo de paro en el proceso regenerativo con $\mathbb{E}[M_i] < \infty$[1], se sigue del lema de Wald que:

$$\mathbb{E}\left[\sum_{m=1}^{M_i} \sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = \mathbb{E}[M_i]\, \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]$$

$$\mathbb{E}\left[\sum_{m=1}^{M_i} \tau_i(m+1) - \tau_i(m)\right] = \mathbb{E}[M_i]\, \mathbb{E}[\tau_i(m+1) - \tau_i(m)]$$

por tanto se tiene que

$$Q_i(z) = \frac{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}[\tau_i(m+1) - \tau_i(m)]}$$

[1]En Stidham[41] y Heyman se muestra que una condición suficiente para que el proceso regenerativo estacionario sea un procesoo estacionario es que el valor esperado del tiempo del ciclo regenerativo sea finito, es decir: $\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right] < \infty$, como cada $C_i^{(m)}$ contiene intervalos de réplica positivos, se tiene que $\mathbb{E}[M_i] < \infty$, además, como $M_i > 0$, se tiene que la condición anterior es equivalente a tener que $\mathbb{E}[C_i] < \infty$, por lo tanto una condición suficiente para la existencia del proceso regenerativo está dada por $\sum_{k=1}^{N} \mu_k < 1$.

observar que el denominador es simplemente la duración promedio del tiempo del ciclo.

Haciendo las siguientes sustituciones en la ecuación (**??**): $n \to t - \tau_i(m)$, $T \to \overline{\tau}_i(m) - \tau_i(m)$, $L_n \to L_i(t)$ y $F(z) = \mathbb{E}\left[z^{L_0}\right] \to F_i(z) = \mathbb{E}\left[z^{L_i \tau_i(m)}\right]$, se puede ver que

$$\mathbb{E}\left[\sum_{n=0}^{T-1} z^{L_n}\right] = \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\overline{\tau}_i(m)-1} z^{L_i(t)}\right] = z\frac{F_i(z)-1}{z-P_i(z)} \tag{37.2.217}$$

Por otra parte durante el tiempo de intervisita para la cola i, $L_i(t)$ solamente se incrementa de manera que el incremento por intervalo de tiempo está dado por la función generadora de probabilidades de $P_i(z)$, por tanto la suma sobre el tiempo de intervisita puede evaluarse como:

$$\begin{aligned}
\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} \{P_i(z)\}^{t-\overline{\tau}_i(m)}\right] = \frac{1-\mathbb{E}\left[\{P_i(z)\}^{\tau_i(m+1)-\overline{\tau}_i(m)}\right]}{1-P_i(z)} \\
&= \frac{1-I_i\left[P_i(z)\right]}{1-P_i(z)}
\end{aligned}$$

por tanto

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = \frac{1-F_i(z)}{1-P_i(z)}$$

Por lo tanto

$$\begin{aligned}
Q_i(z) &= \frac{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}\left[\tau_i(m+1)-\tau_i(m)\right]} \\
&= \frac{1}{\mathbb{E}\left[\tau_i(m+1)-\tau_i(m)\right]}\left\{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\overline{\tau}_i(m)-1} z^{L_i(t)}\right] + \mathbb{E}\left[\sum_{t=\overline{\tau}_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]\right\} \\
&= \frac{1}{\mathbb{E}\left[\tau_i(m+1)-\tau_i(m)\right]}\left\{z\frac{F_i(z)-1}{z-P_i(z)} + \frac{1-F_i(z)}{1-P_i(z)}\right\}
\end{aligned}$$

es decir

$$Q_i(z) = \frac{1}{\mathbb{E}\left[C_i\right]} \cdot \frac{1-F_i(z)}{P_i(z)-z} \cdot \frac{(1-z)\,P_i(z)}{1-P_i(z)} \tag{37.2.218}$$

Teorema 37.2.129 *Dada una Red de Sistemas de Visitas Cíclicas (RSVC), conformada por dos Sistemas de Visitas Cíclicas (SVC), donde cada uno de ellos consta de dos colas tipo $M/M/1$. Los dos sistemas están comunicados entre sí por medio de la transferencia de usuarios entre las colas $Q_1 \leftrightarrow Q_3$ y $Q_2 \leftrightarrow Q_4$. Se definen los eventos para los procesos de arribos al tiempo t, $A_j(t) = \{0$ arribos en Q_j al tiempo $t\}$ para algún tiempo $t \geq 0$ y Q_j la cola j-ésima en la RSVC, para $j = 1,2,3,4$. Existe un intervalo $I \neq \emptyset$ tal que para $T^* \in I$, tal que $\mathbb{P}\left\{A_1(T^*), A_2(Tt^*), A_3(T^*), A_4(T^*) \,|T^* \in I\right\} > 0$.*

Demostración 37.2.2 *Sin pérdida de generalidad podemos considerar como base del análisis a la cola Q_1 del primer sistema que conforma la RSVC.*

Sea $n > 0$, ciclo en el primer sistema en el que se sabe que $L_j(\overline{\tau}_1(n)) = 0$, pues la política de servicio con que atienden los servidores es la exhaustiva. Como es sabido, para trasladarse a la siguiente cola, el servidor incurre en un tiempo de traslado $r_1(n) > 0$, entonces tenemos que $\tau_2(n) = \overline{\tau}_1(n) + r_1(n)$.

Definamos el intervalo $I_1 \equiv [\overline{\tau}_1(n), \tau_2(n)]$ de longitud $\xi_1 = r_1(n)$. Dado que los tiempos entre arribo son exponenciales con tasa $\tilde{\mu}_1 = \mu_1 + \hat{\mu}_1$ (μ_1 son los arribos a Q_1 por primera vez al sistema, mientras que $\hat{\mu}_1$ son los arribos de traslado procedentes de Q_3) se tiene que la probabilidad del evento $A_1(t)$ está dada por

$$\mathbb{P}\left\{A_1(t)\,|t \in I_1(n)\right\} = e^{-\tilde{\mu}_1 \xi_1(n)}. \tag{37.2.219}$$

Por otra parte, para la cola Q_2, el tiempo $\overline{\tau}_2(n-1)$ es tal que $L_2(\overline{\tau}_2(n-1)) = 0$, es decir, es el tiempo en que la cola queda totalmente vacía en el ciclo anterior a n. Entonces tenemos un sgundo intervalo $I_2 \equiv [\overline{\tau}_2(n-1), \tau_2(n)]$. Por lo tanto la probabilidad del evento $A_2(t)$ tiene probabilidad dada por

$$\mathbb{P}\left\{A_2(t)\,|t \in I_2(n)\right\} = e^{-\tilde{\mu}_2 \xi_2(n)}, \tag{37.2.220}$$

donde $\xi_2(n) = \tau_2(n) - \overline{\tau}_2(n-1)$.

Entonces, se tiene que

$$\begin{aligned}\mathbb{P}\{A_1(t), A_2(t)\,|t \in I_1(n)\} &= \mathbb{P}\{A_1(t)\,|t \in I_1(n)\}\,\mathbb{P}\{A_2(t)\,|t \in I_1(n)\} \\ &\geq \mathbb{P}\{A_1(t)\,|t \in I_1(n)\}\,\mathbb{P}\{A_2(t)\,|t \in I_2(n)\} \\ &= e^{-\tilde{\mu}_1\xi_1(n)}e^{-\tilde{\mu}_2\xi_2(n)} = e^{-[\tilde{\mu}_1\xi_1(n)+\tilde{\mu}_2\xi_2(n)]}.\end{aligned}$$

es decir,

$$\mathbb{P}\{A_1(t), A_2(t)\,|t \in I_1(n)\} = e^{-[\tilde{\mu}_1\xi_1(n)+\tilde{\mu}_2\xi_2(n)]} > 0. \tag{37.2.221}$$

En lo que respecta a la relación entre los dos SVC que conforman la RSVC, se afirma que existe $m > 0$ *tal que* $\overline{\tau}_3(m) < \tau_2(n) < \tau_4(m)$.

Para Q_3 *sea* $I_3 = [\overline{\tau}_3(m), \tau_4(m)]$ *con longitud* $\xi_3(m) = r_3(m)$, *entonces*

$$\mathbb{P}\{A_3(t)\,|t \in I_3(n)\} = e^{-\tilde{\mu}_3\xi_3(n)}. \tag{37.2.222}$$

Análogamente que como se hizo para Q_2, *tenemos que para* Q_4 *se tiene el intervalo* $I_4 = [\overline{\tau}_4(m-1), \tau_4(m)]$ *con longitud* $\xi_4(m) = \tau_4(m) - \overline{\tau}_4(m-1)$, *entonces*

$$\mathbb{P}\{A_4(t)\,|t \in I_4(m)\} = e^{-\tilde{\mu}_4\xi_4(n)}. \tag{37.2.223}$$

Al igual que para el primer sistema, dado que $I_3(m) \subset I_4(m)$, *se tiene que*

$$\begin{aligned}\xi_3(m) \leq \xi_4(m) &\Leftrightarrow -\xi_3(m) \geq -\xi_4(m) \\ -\tilde{\mu}_4\xi_3(m) \geq -\tilde{\mu}_4\xi_4(m) &\Leftrightarrow e^{-\tilde{\mu}_4\xi_3(m)} \geq e^{-\tilde{\mu}_4\xi_4(m)} \\ \mathbb{P}\{A_4(t)\,|t \in I_3(m)\} &\geq \mathbb{P}\{A_4(t)\,|t \in I_4(m)\}\end{aligned}$$

Entonces, dado que los eventos A_3 *y* A_4 *son independientes, se tiene que*

$$\begin{aligned}\mathbb{P}\{A_3(t), A_4(t)\,|t \in I_3(m)\} &= \mathbb{P}\{A_3(t)\,|t \in I_3(m)\}\,\mathbb{P}\{A_4(t)\,|t \in I_3(m)\} \\ &\geq \mathbb{P}\{A_3(t)\,|t \in I_3(n)\}\,\mathbb{P}\{A_4(t)\,|t \in I_4(n)\} \\ &= e^{-\tilde{\mu}_3\xi_3(m)}e^{-\tilde{\mu}_4\xi_4(m)} = e^{-[\tilde{\mu}_3\xi_3(m)+\tilde{\mu}_4\xi_4(m)]}.\end{aligned}$$

es decir,

$$\mathbb{P}\{A_3(t), A_4(t)\,|t \in I_3(m)\} = e^{-[\tilde{\mu}_3\xi_3(m)+\tilde{\mu}_4\xi_4(m)]} > 0. \tag{37.2.224}$$

Por construcción se tiene que $I(n,m) \equiv I_1(n) \cap I_3(m) \neq \emptyset$,*entonces en particular se tienen las contenciones* $I(n,m) \subseteq I_1(n)$ *y* $I(n,m) \subseteq I_3(m)$, *por lo tanto si definimos* $\xi_{n,m} \equiv \ell(I(n,m))$ *tenemos que*

$$\xi_{n,m} \leq \xi_1(n) \;\; y \;\; \xi_{n,m} \leq \xi_3(m) \;\; entonces \;\; -\xi_{n,m} \geq -\xi_1(n) \;\; y \;\; -\xi_{n,m} \leq -\xi_3(m)$$

por lo tanto tenemos las desigualdades

$$\begin{aligned}-\tilde{\mu}_1\xi_{n,m} \geq -\tilde{\mu}_1\xi_1(n), \quad -\tilde{\mu}_2\xi_{n,m} \geq -\tilde{\mu}_2\xi_1(n) \geq -\tilde{\mu}_2\xi_2(n), \\ -\tilde{\mu}_3\xi_{n,m} \geq -\tilde{\mu}_3\xi_3(m), \quad -\tilde{\mu}_4\xi_{n,m} \geq -\tilde{\mu}_4\xi_3(m) \geq -\tilde{\mu}_4\xi_4(m).\end{aligned}$$

Sea $T^* \in I_{n,m}$, *entonces dado que en particular* $T^* \in I_1(n)$ *se cumple con probabilidad positiva que no hay arribos a las colas* Q_1 *y* Q_2, *en consecuencia, tampoco hay usuarios de transferencia para* Q_3 *y* Q_4, *es decir,* $\tilde{\mu}_1 = \mu_1$, $\tilde{\mu}_2 = \mu_2$, $\tilde{\mu}_3 = \mu_3$, $\tilde{\mu}_4 = \mu_4$, *es decir, los eventos* Q_1 *y* Q_3 *son condicionalmente independientes en el intervalo* $I_{n,m}$; *lo mismo ocurre para las colas* Q_2 *y* Q_4, *por lo tanto tenemos que*

$$\begin{aligned}&\mathbb{P}\{A_1(T^*), A_2(T^*), A_3(T^*), A_4(T^*)\,|T^* \in I_{n,m}\} = \textstyle\prod_{j=1}^4 \mathbb{P}\{A_j(T^*)\,|T^* \in I_{n,m}\} \\ &\geq \mathbb{P}\{A_1(T^*)\,|T^* \in I_1(n)\}\,\mathbb{P}\{A_2(T^*)\,|T^* \in I_2(n)\}\,\mathbb{P}\{A_3(T^*)\,|T^* \in I_3(m)\}\,\mathbb{P}\{A_4(T^*)\,|T^* \in I_4(m)\} \\ &= e^{-\mu_1\xi_1(n)}e^{-\mu_2\xi_2(n)}e^{-\mu_3\xi_3(m)}e^{-\mu_4\xi_4(m)} = e^{-[\tilde{\mu}_1\xi_1(n)+\tilde{\mu}_2\xi_2(n)+\tilde{\mu}_3\xi_3(m)+\tilde{\mu}_4\xi_4(m)]} > 0.\end{aligned} \tag{37.2.225}$$

Estos resultados aparecen en Daley (1968) [13] para $\{T_n\}$ intervalos de inter-arribo, $\{D_n\}$ intervalos de inter-salida y $\{S_n\}$ tiempos de servicio.

- Si el proceso $\{T_n\}$ es Poisson, el proceso $\{D_n\}$ es no correlacionado si y sólo si es un proceso Poisso, lo cual ocurre si y sólo si $\{S_n\}$ son exponenciales negativas.
- Si $\{S_n\}$ son exponenciales negativas, $\{D_n\}$ es un proceso de renovación si y sólo si es un proceso Poisson, lo cual ocurre si y sólo si $\{T_n\}$ es un proceso Poisson.
- $\mathbb{E}(D_n) = \mathbb{E}(T_n)$.
- Para un sistema de visitas $GI/M/1$ se tiene el siguiente teorema:

  Teorema 37.2.130 *En un sistema estacionario $GI/M/1$ los intervalos de interpartida tienen*

$$\begin{aligned}
\mathbb{E}\left(e^{-\theta D_n}\right) &= \mu(\mu+\theta)^{-1}\left[\delta\theta - \mu(1-\delta)\alpha(\theta)\right]\left[\theta - \mu(1-\delta)^{-1}\right] \\
\alpha(\theta) &= \mathbb{E}\left[e^{-\theta T_0}\right] \\
var(D_n) &= var(T_0) - \left(\tau^{-1} - \delta^{-1}\right) 2\delta\left(\mathbb{E}(S_0)\right)^2(1-\delta)^{-1}.
\end{aligned}$$

  Teorema 37.2.131 *El proceso de salida de un sistema de colas estacionario $GI/M/1$ es un proceso de renovación si y sólo si el proceso de entrada es un proceso Poisson, en cuyo caso el proceso de salida es un proceso Poisson.*

  Teorema 37.2.132 *Los intervalos de interpartida $\{D_n\}$ de un sistema $M/G/1$ estacionario son no correlacionados si y sólo si la distribución de los tiempos de servicio es exponencial negativa, es decir, el sistema es de tipo $M/M/1$.*

En Sigman, Thorison y Wolff [40] prueban que para la existencia de un una sucesión infinita no decreciente de tiempos de regeneración $\tau_1 \leq \tau_2 \leq \cdots$ en los cuales el proceso se regenera, basta un tiempo de regeneración R_1, donde $R_j = \tau_j - \tau_{j-1}$. Para tal efecto se requiere la existencia de un espacio de probabilidad $(\Omega, \mathcal{F}, \mathbb{P})$, y proceso estocástico $X = \{X(t) : t \geq 0\}$ con espacio de estados $(S, \mathcal{R})$, con $\mathcal{R}$ σ-álgebra.

Proposición 37.2.90 *Si existe una variable aleatoria no negativa R_1 tal que $\theta_{R1}X =_D X$, entonces $(\Omega, \mathcal{F}, \mathbb{P})$ puede extenderse para soportar una sucesión estacionaria de variables aleatorias $R = \{R_k : k \geq 1\}$, tal que para $k \geq 1$,*

$$\theta_k(X, R) =_D (X, R).$$

Además, para $k \geq 1$, $\theta_k R$ es condicionalmente independiente de $(X, R_1, \ldots, R_k)$, dado $\theta_{\tau k}X$.

- Doob en 1953 demostró que el estado estacionario de un proceso de partida en un sistema de espera $M/G/\infty$, es Poisson con la misma tasa que el proceso de arribos.
- Burke en 1968, fue el primero en demostrar que el estado estacionario de un proceso de salida de una cola $M/M/s$ es un proceso Poisson.
- Disney en 1973 obtuvo el siguiente resultado:

  Teorema 37.2.133 *Para el sistema de espera $M/G/1/L$ con disciplina FIFO, el proceso $\boldsymbol{I}$ es un proceso de renovación si y sólo si el proceso denominado longitud de la cola es estacionario y se cumple cualquiera de los siguientes casos:*

  a) Los tiempos de servicio son identicamente cero;
  b) $L = 0$, para cualquier proceso de servicio S;
  c) $L = 1$ y $G = D$;
  d) $L = \infty$ y $G = M$.

  En estos casos, respectivamente, las distribuciones de interpartida $P\{T_{n+1} - T_n \leq t\}$ son

  a) $1 - e^{-\lambda t}$, $t \geq 0$;
  b) $1 - e^{-\lambda t} * F(t)$, $t \geq 0$;
  c) $1 - e^{-\lambda t} * \mathbb{1}_d(t)$, $t \geq 0$;
  d) $1 - e^{-\lambda t} * F(t)$, $t \geq 0$.

- Finch (1959) mostró que para los sistemas $M/G/1/L$, con $1 \leq L \leq \infty$ con distribuciones de servicio dos veces diferenciable, solamente el sistema $M/M/1/\infty$ tiene proceso de salida de renovación estacionario.
- King (1971) demostro que un sistema de colas estacionario $M/G/1/1$ tiene sus tiempos de interpartida sucesivas D_n y D_{n+1} son independientes, si y sólo si, $G = D$, en cuyo caso le proceso de salida es de renovación.
- Disney (1973) demostró que el único sistema estacionario $M/G/1/L$, que tiene proceso de salida de renovación son los sistemas $M/M/1$ y $M/D/1/1$.
- El siguiente resultado es de Disney y Koning (1985)

  Teorema 37.2.134 *En un sistema de espera $M/G/s$, el estado estacionario del proceso de salida es un proceso Poisson para cualquier distribución de los tiempos de servicio si el sistema tiene cualquiera de las siguientes cuatro propiedades.*

  a) $s = \infty$

b) La disciplina de servicio es de procesador compartido.
c) La disciplina de servicio es LCFS y preemptive resume, esto se cumple para $L < \infty$
d) $G = M$.

- El siguiente resultado es de Alamatsaz (1983)

Teorema 37.2.135 *En cualquier sistema de colas $GI/G/1/L$ con $1 \leq L < \infty$ y distribución de interarribos A y distribución de los tiempos de servicio B, tal que $A(0) = 0$, $A(t)(1 - B(t)) > 0$ para alguna $t > 0$ y $B(t)$ para toda $t > 0$, es imposible que el proceso de salida estacionario sea de renovación.*

Estos resultados aparecen en Daley (1968) [13] para $\{T_n\}$ intervalos de inter-arribo, $\{D_n\}$ intervalos de inter-salida y $\{S_n\}$ tiempos de servicio.

- Si el proceso $\{T_n\}$ es Poisson, el proceso $\{D_n\}$ es no correlacionado si y sólo si es un proceso Poisso, lo cual ocurre si y sólo si $\{S_n\}$ son exponenciales negativas.
- Si $\{S_n\}$ son exponenciales negativas, $\{D_n\}$ es un proceso de renovación si y sólo si es un proceso Poisson, lo cual ocurre si y sólo si $\{T_n\}$ es un proceso Poisson.
- $\mathbb{E}(D_n) = \mathbb{E}(T_n)$.
- Para un sistema de visitas $GI/M/1$ se tiene el siguiente teorema:

Teorema 37.2.136 *En un sistema estacionario $GI/M/1$ los intervalos de interpartida tienen*

$$\begin{aligned}
\mathbb{E}\left(e^{-\theta D_n}\right) &= \mu(\mu+\theta)^{-1}\left[\delta\theta - \mu(1-\delta)\alpha(\theta)\right]\left[\theta - \mu(1-\delta)^{-1}\right] \\
\alpha(\theta) &= \mathbb{E}\left[e^{-\theta T_0}\right] \\
var(D_n) &= var(T_0) - \left(\tau^{-1} - \delta^{-1}\right) 2\delta\left(\mathbb{E}(S_0)\right)^2(1-\delta)^{-1}.
\end{aligned}$$

Teorema 37.2.137 *El proceso de salida de un sistema de colas estacionario $GI/M/1$ es un proceso de renovación si y sólo si el proceso de entrada es un proceso Poisson, en cuyo caso el proceso de salida es un proceso Poisson.*

Teorema 37.2.138 *Los intervalos de interpartida $\{D_n\}$ de un sistema $M/G/1$ estacionario son no correlacionados si y sólo si la distribución de los tiempos de servicio es exponencial negativa, es decir, el sistema es de tipo $M/M/1$.*

Sean Q_1, Q_2, Q_3 y Q_4 en una Red de Sistemas de Visitas Cíclicas (RSVC). Supongamos que cada una de las colas es del tipo $M/M/1$ con tasa de arribo μ_i y que la transferencia de usuarios entre los dos sistemas ocurre entre $Q_1 \leftrightarrow Q_3$ y $Q_2 \leftrightarrow Q_4$ con respectiva tasa de arribo igual a la tasa de salida $\hat{\mu}_i = \mu_i$, esto se sabe por lo desarrollado en la sección anterior.

Consideremos, sin pérdida de generalidad como base del análisis, la cola Q_1 además supongamos al servidor lo comenzamos a observar una vez que termina de atender a la misma para desplazarse y llegar a Q_2, es decir al tiempo τ_2.

Sea $n \in \mathbb{N}$, $n > 0$, ciclo del servidor en que regresa a Q_1 para dar servicio y atender conforme a la política exhaustiva, entonces se tiene que $\overline{\tau}_1(n)$ es el tiempo del servidor en el sistema 1 en que termina de dar servicio a todos los usuarios presentes en la cola, por lo tanto se cumple que $L_1(\overline{\tau}_1(n)) = 0$, entonces el servidor para llegar a Q_2 incurre en un tiempo de traslado r_1 y por tanto se cumple que $\tau_2(n) = \overline{\tau}_1(n) + r_1$. Dado que los tiempos entre arribos son exponenciales se cumple que

$$\begin{aligned}
\mathbb{P}\{0 \text{ arribos en } Q_1 \text{ en el intervalo } [\overline{\tau}_1(n), \overline{\tau}_1(n) + r_1]\} &= e^{-\tilde{\mu}_1 r_1}, \\
\mathbb{P}\{0 \text{ arribos en } Q_2 \text{ en el intervalo } [\overline{\tau}_1(n), \overline{\tau}_1(n) + r_1]\} &= e^{-\tilde{\mu}_2 r_1}.
\end{aligned}$$

El evento que nos interesa consiste en que no haya arribos desde que el servidor abandonó Q_2 y regresa nuevamente para dar servicio, es decir en el intervalo de tiempo $[\overline{\tau}_2(n-1), \tau_2(n)]$. Entonces, si hacemos

$$\begin{aligned}
\varphi_1(n) &\equiv \overline{\tau}_1(n) + r_1 = \overline{\tau}_2(n-1) + r_1 + r_2 + \overline{\tau}_1(n) - \tau_1(n) \\
&= \overline{\tau}_2(n-1) + \overline{\tau}_1(n) - \tau_1(n) + r, ,
\end{aligned}$$

y longitud del intervalo

$$\begin{aligned}
\xi &\equiv \overline{\tau}_1(n) + r_1 - \overline{\tau}_2(n-1) = \overline{\tau}_2(n-1) + \overline{\tau}_1(n) - \tau_1(n) + r - \overline{\tau}_2(n-1) \\
&= \overline{\tau}_1(n) - \tau_1(n) + r.
\end{aligned}$$

Entonces, determinemos la probabilidad del evento no arribos a Q_2 en $[\overline{\tau}_2(n-1), \varphi_1(n)]$:

$$\mathbb{P}\{0 \text{ arribos en } Q_2 \text{ en el intervalo } [\overline{\tau}_2(n-1), \varphi_1(n)]\} = e^{-\tilde{\mu}_2 \xi}. \tag{37.2.226}$$

De manera análoga, tenemos que la probabilidad de no arribos a Q_1 en $[\overline{\tau}_2(n-1), \varphi_1(n)]$ esta dada por

$$\mathbb{P}\{0 \text{ arribos en } Q_1 \text{ en el intervalo } [\overline{\tau}_2(n-1), \varphi_1(n)]\} = e^{-\tilde{\mu}_1 \xi}, \tag{37.2.227}$$

$$\mathbb{P}\{0 \text{ arribos en } Q_2 \text{ en el intervalo } [\overline{\tau}_2(n-1), \varphi_1(n)]\} = e^{-\tilde{\mu}_2 \xi}. \tag{37.2.228}$$

Por tanto

$$\begin{aligned} &\mathbb{P}\{0 \text{ arribos en } Q_1 \text{ y } Q_2 \text{ en el intervalo } [\overline{\tau}_2(n-1), \varphi_1(n)]\} \\ &= \mathbb{P}\{0 \text{ arribos en } Q_1 \text{ en el intervalo } [\overline{\tau}_2(n-1), \varphi_1(n)]\} \\ &\times \mathbb{P}\{0 \text{ arribos en } Q_2 \text{ en el intervalo } [\overline{\tau}_2(n-1), \varphi_1(n)]\} = e^{-\tilde{\mu}_1 \xi} e^{-\tilde{\mu}_2 \xi} = e^{-\tilde{\mu} \xi}. \end{aligned} \tag{37.2.229}$$

Para el segundo sistema, consideremos nuevamente $\overline{\tau}_1(n) + r_1$, sin pérdida de generalidad podemos suponer que existe $m > 0$ tal que $\overline{\tau}_3(m) < \overline{\tau}_1 + r_1 < \tau_4(m)$, entonces

$$\mathbb{P}\{0 \text{ arribos en } Q_3 \text{ en el intervalo } [\overline{\tau}_3(m), \overline{\tau}_1(n) + r_1]\} = e^{-\tilde{\mu}_3 \xi_3}, \tag{37.2.230}$$

donde

$$\xi_3 = \overline{\tau}_1(n) + r_1 - \overline{\tau}_3(m) = \overline{\tau}_1(n) - \overline{\tau}_3(m) + r_1, \tag{37.2.231}$$

mientras que para Q_4 al igual que con Q_2 escribiremos $\tau_4(m)$ en términos de $\overline{\tau}_4(m-1)$:

$\varphi_2 \equiv \tau_4(m) = \overline{\tau}_4(m-1) + r_4 + \overline{\tau}_3(m) - \tau_3(m) + r_3 = \overline{\tau}_4(m-1) + \overline{\tau}_3(m) - \tau_3(m) + \hat{r}$, además,

$\xi_2 \equiv \varphi_2(m) - \overline{\tau}_1 - r_1 = \overline{\tau}_4(m-1) + \overline{\tau}_3(m) - \tau_3(m) - \overline{\tau}_1(n) + \hat{r} - r_1$.

Entonces

$$\mathbb{P}\{0 \text{ arribos en } Q_4 \text{ en el intervalo } [\overline{\tau}_1(n) + r_1, \varphi_2(m)]\} = e^{-\tilde{\mu}_4 \xi_2}, \tag{37.2.232}$$

mientras que para Q_3 se tiene que

$$\mathbb{P}\{0 \text{ arribos en } Q_3 \text{ en el intervalo } [\overline{\tau}_1(n) + r_1, \varphi_2(m)]\} = e^{-\tilde{\mu}_3 \xi_2} \tag{37.2.233}$$

Por tanto

$$\mathbb{P}\{0 \text{ arribos en } Q_3 \wedge Q_4 \text{ en el intervalo } [\overline{\tau}_1(n) + r_1, \varphi_2(m)]\} = e^{-\hat{\mu} \xi_2} \tag{37.2.234}$$

donde $\hat{\mu} = \tilde{\mu}_3 + \tilde{\mu}_4$.

Ahora, definamos los intervalos $\mathcal{I}_1 = [\overline{\tau}_1(n) + r_1, \varphi_1(n)]$ y $\mathcal{I}_2 = [\overline{\tau}_1(n) + r_1, \varphi_2(m)]$, entonces, sea $\mathcal{I} = \mathcal{I}_1 \cap \mathcal{I}_2$ el intervalo donde cada una de las colas se encuentran vacías, es decir, si tomamos $T^* \in \mathcal{I}$, entonces $L_1(T^*) = L_2(T^*) = L_3(T^*) = L_4(T^*) = 0$.

Ahora, dado que por construcción $\mathcal{I} \neq \emptyset$ y que para $T^* \in \mathcal{I}$ en ninguna de las colas han llegado usuarios, se tiene que no hay transferencia entre las colas, por lo tanto, el sistema 1 y el sistema 2 son condicionalmente independientes en $\mathcal{I}$, es decir

$$\mathbb{P}\{L_1(T^*), L_2(T^*), L_3(T^*), L_4(T^*) | T^* \in \mathcal{I}\} = \prod_{j=1}^{4} \mathbb{P}\{L_j(T^*)\}, \tag{37.2.235}$$

para $T^* \in \mathcal{I}$.

Definición 37.2.195 (Definición Clásica) *Un proceso estocástico $X = \{X(t) : t \geq 0\}$ es llamado regenerativo is existe una variable aleatoria $R_1 > 0$ tal que*

i) $\{X(t + R_1) : t \geq 0\}$ *es independiente de* $\{\{X(t) : t < R_1\},\}$

ii) $\{X(t + R_1) : t \geq 0\}$ *es estocásticamente equivalente a* $\{X(t) : t > 0\}$

Llamamos a R_1 tiempo de regeneración, y decimos que X se regenera en este punto.

$\{X(t + R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Nota 37.2.115 *La existencia de un primer tiempo de regeneración, R_1, implica la existencia de una sucesión completa de estos tiempos $R_1, R_2 \ldots$, que satisfacen la propiedad deseada [40].*

Nota 37.2.116 *Para la cola $GI/GI/1$ los usuarios arriban con tiempos t_n y son atendidos con tiempos de servicio S_n, los tiempos de arribo forman un proceso de renovación con tiempos entre arribos independientes e identicamente distribuidos (i.i.d.)$T_n = t_n - t_{n-1}$, además los tiempos de servicio son i.i.d. e independientes de los procesos de arribo. Por estable se entiende que $\mathbb{E}S_n < \mathbb{E}T_n < \infty$.*

Definición 37.2.196 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t} \int_0^\infty X(u)\, du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t} \int_0^\infty I_x(u)\, du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\, dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.2.117 *Funciones de procesos regenerativos son regenerativas, es decir, si $X(t)$ es regenerativo y se define el proceso $Y(t)$ por $Y(t) = f(X(t))$ para alguna función Borel medible $f(\cdot)$. Además Y es regenerativo con los mismos tiempos de renovación que X.*

En general, los tiempos de renovación, Z_k de un proceso regenerativo no requieren ser tiempos de paro con respecto a la evolución de $X(t)$.

Nota 37.2.118 *Una función de un proceso de Markov, usualmente no será un proceso de Markov, sin embargo será regenerativo si el proceso de Markov lo es.*

Nota 37.2.119 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Nota 37.2.120

a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.

b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\{V(t-s) \in A | X_1 > t - s\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones (*puntos de regeneración*) que ocurren en $[0, t]$. El intervalo $[0, X_1)$ es llamado *primer ciclo de regeneración* de $\{V(t), t \geq 0\}$, $[X_1, X_1 + X_2)$ el *segundo ciclo de regeneración*, y así sucesivamente.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 37.2.197 *Se define el proceso estacionario, $\{V^*(t), t \geq 0\}$, para $\{V(t), t \geq 0\}$ por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]} \int_0^\infty \mathbb{P}\{V(t+x) \in A | X > x\}(1 - F(x))\, dx,$$

para todo $t \geq 0$ y todo conjunto de Borel A.

Definición 37.2.198 *Una distribución se dice que es* aritmética *si todos sus puntos de incremento son múltiplos de la forma $0, \lambda, 2\lambda, \ldots$ para alguna $\lambda > 0$ entera.*

Definición 37.2.199 *Una modificación medible de un proceso $\{V(t), t \geq 0\}$, es una versión de este, $\{V(t, w)\}$ conjuntamente medible para $t \geq 0$ y para $w \in S$, S espacio de estados para $\{V(t), t \geq 0\}$.*

Teorema 37.2.139 *Sea $\{V(t), t \geq\}$ un proceso regenerativo no negativo con modificación medible. Sea $\mathbb{E}[X] < \infty$. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de t, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$, equivalentemente, si $\mathbb{E}\left[\int_0^X V(s)\,ds\right] < \infty$,entonces

$$\frac{\int_0^t V(s)\,ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$.

Corolario 37.2.65 *Sea $\{V(t), t \geq 0\}$ un proceso regenerativo no negativo, con modificación medible. Si $\mathbb{E} < \infty$, F es no-aritmética, y para todo $x \geq 0$, $P\{V(t) \leq x, C > x\}$ es de variación acotada como función de t en cada intervalo finito $[0, \tau]$, entonces $V(t)$ converge en distribución cuando $t \to \infty$ y*

$$\mathbb{E}V = \frac{\mathbb{E}\int_0^X V(s)\,ds}{\mathbb{E}X}$$

Donde V tiene la distribución límite de $V(t)$ cuando $t \to \infty$.

Para el caso discreto se tienen resultados similares.

Definición 37.2.200 *Sean $0 \leq T_1 \leq T_2 \leq \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0, t)$ es*

$$N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t), \tag{37.2.236}$$

para $t \geq 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.2.201 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \geq 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0, t)$*

Nota 37.2.121 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^{n} \xi_k$ y $N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes NÃºmeros.*

Nota 37.2.122 *Una función $h : \mathbb{R}_+ \to \mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ es decreciente y Riemann Integrable.

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)| \leq b(t)$, donde b es DRI.

Teorema 37.2.140 (Teorema Principal de Renovación) *Si F es no aritmética y $h(t)$ es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty} U \star h = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds.$$

Proposición 37.2.91 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t < 0$ puede expresarse como*

$$H(t) = U \star h(t), \text{ donde } h(t) = H(t) - F \star H(t)$$

Definición 37.2.202 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}\left[X(T+t)\,|T\right] = \mathbb{E}\left[X(t)\right], \text{ para } t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.2.92 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}\left[X(t)\right] = U \star h(t), \text{ donde } h(t) = \mathbb{E}\left[X(t)\,\mathbb{1}(T > t)\right].$$

Teorema 37.2.141 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M = \sup\{|X(t)| : t \leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}\left[X(t)\right] = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds,$$

donde $h(t) = \mathbb{E}\left[X(t)\,\mathbb{1}(T > t)\right]$.

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq \quad t &< T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}\left[N(t)\right] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.2.93 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Nota 37.2.123 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.2.142 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1}T_n = \mu, \text{ c.s.} \tag{37.2.237}$$

$$lim_{t\to\infty} t^{-1}N(t) = 1/\mu, \text{ c.s.} \tag{37.2.238}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.2.66 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1}N(t) \to 1/\mu, \text{ c.s. cuando } t \to \infty. \tag{37.2.239}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.2.203 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.2.143 *Supóngase que $n^{-1}T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \ c.s. \tag{37.2.240}$$

$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \ c.s. \tag{37.2.241}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.2.67 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \ c.s. \ cuando \ t \to \infty. \tag{37.2.242}$$

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq \ & t \ < T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.2.94 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Nota 37.2.124 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.2.144 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{37.2.243}$$

$$lim_{t\to\infty} t^{-1} N(t) = 1/\mu, \ c.s. \tag{37.2.244}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.2.68 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1} N(t) \to 1/\mu, \ c.s. \ cuando \ t \to \infty. \tag{37.2.245}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.2.204 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.2.145 *Supóngase que $n^{-1}T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \ c.s. \tag{37.2.246}$$
$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \ c.s. \tag{37.2.247}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.2.69 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \ c.s. \ cuando \ t \to \infty. \tag{37.2.248}$$

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq &\ t < T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.2.95 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Nota 37.2.125 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.2.146 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{37.2.249}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.2.207 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.2.151 *Supóngase que $n^{-1} T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \ c.s. \tag{37.2.264}$$
$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \ c.s. \tag{37.2.265}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.2.75 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \ c.s. \ cuando \ t \to \infty. \tag{37.2.266}$$

Definición 37.2.208 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t < 0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t) = h(t) + \int_{[0,t]} H(t-s)\, dF(s), \ t \geq 0, \tag{37.2.267}$$

donde $H(t)$ es una función de valores reales. Esto es $H = h + F \star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t < 0$.

Proposición 37.2.98 *La función $U \star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.2.152 (Teorema Renovación Elemental)

$$t^{-1} U(t) \to 1/\mu, \ cuando \ t \to \infty.$$

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.2.209 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t) = \sum_{n=1}^{\infty} F^{n\star}(t), \ t \geq 0,$$

donde $F^{0\star}(t) = \mathbb{1}(t \geq 0)$.

Proposición 37.2.99 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t > 0$, y es $U'(t) = \sum_{n=0}^{\infty} f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t) > N(t-)\} = 0, \ t \geq 0.$$

Definición 37.2.210 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha) = \int_{\mathbb{R}_+} e^{-\alpha t} dF(t), \ \alpha \geq 0.$$

Entonces

$$\hat{U}(\alpha) = \sum_{n=0}^{\infty} F^{\hat{n}\star}(\alpha) = \sum_{n=0}^{\infty} \hat{F}(\alpha)^n = \frac{1}{1-\hat{F}(\alpha)}.$$

Proposición 37.2.100 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha) = \frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.2.128 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)] = \lambda t$, para $t \geq 0$.*

Teorema 37.2.153 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t) = \mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f : \mathbb{R}_+ \to \mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()} f(T_n)\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista. Además si $X_1, X_2, \ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n | T_n = s] = f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)} X_n\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista.

Corolario 37.2.76 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right] = \mu \mathbb{E}[N(t)+1], \ t \geq 0,$$

Definición 37.2.211 *Sean $0 \leq T_1 \leq T_2 \leq \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0,t)$ es*

$$N(t) = \sum_{n=1}^{\infty} 1\!\!1(T_n \leq t), \tag{37.2.268}$$

para $t \geq 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.2.212 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \geq 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0,t)$*

Nota 37.2.129 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^{n} \xi_k$ y $N(t) = \sum_{n=1}^{\infty} 1\!\!1(T_n \leq t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes NÃºmeros.*

Definición 37.2.213 *Sean $0 \leq T_1 \leq T_2 \leq \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0,t)$ es*

$$N(t) = \sum_{n=1}^{\infty} 1\!\!1(T_n \leq t), \tag{37.2.269}$$

para $t \geq 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.2.214 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \geq 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0, t)$*

Nota 37.2.130 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^{n} \xi_k$ y $N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes Números.*

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq & \quad t \quad < T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.2.101 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Ejemplo 37.2.5 (Proceso Poisson) *Suponga que se tienen tiempos de inter-renovación i.i.d. del proceso de renovación $N(t)$ tienen distribución exponencial $F(t) = q - e^{-\lambda t}$ con tasa λ. Entonces $N(t)$ es un proceso Poisson con tasa λ.*

Nota 37.2.131 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.2.154 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{37.2.270}$$

$$lim_{t\to\infty} t^{-1} N(t) = 1/\mu, \ c.s. \tag{37.2.271}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.2.77 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1} N(t) \to 1/\mu, \ c.s. \ cuando \ t \to \infty. \tag{37.2.272}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.2.215 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.2.155 *Supóngase que $n^{-1}T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \text{ c.s.} \tag{37.2.273}$$

$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \text{ c.s.} \tag{37.2.274}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.2.78 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \text{ c.s. cuando } t \to \infty. \tag{37.2.275}$$

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.2.216 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t) = \sum_{n=1}^{\infty} F^{n\star}(t), \ t \geq 0,$$

donde $F^{0\star}(t) = \mathbb{1}(t \geq 0)$.

Proposición 37.2.102 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t > 0$, y es $U'(t) = \sum_{n=0}^{\infty} f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t) > N(t-)\} = 0, \ t \geq 0.$$

Definición 37.2.217 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha) = \int_{\mathbb{R}_+} e^{-\alpha t} dF(t), \ \alpha \geq 0.$$

Entonces

$$\hat{U}(\alpha) = \sum_{n=0}^{\infty} \hat{F^{n\star}}(\alpha) = \sum_{n=0}^{\infty} \hat{F}(\alpha)^n = \frac{1}{1 - \hat{F}(\alpha)}.$$

Proposición 37.2.103 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha) = \frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.2.132 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)] = \lambda t$, para $t \geq 0$.*

Teorema 37.2.156 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t) = \mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f : \mathbb{R}_+ \to \mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()} f(T_n)\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista. Además si $X_1, X_2, \ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n | T_n = s] = f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)} X_n\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista.

Corolario 37.2.79 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right] = \mu\mathbb{E}\left[N(t)+1\right],\ t \geq 0,$$

Definición 37.2.218 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t < 0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t) = h(t) + \int_{[0,t]} H(t-s)\, dF(s),\ t \geq 0, \tag{37.2.276}$$

donde $H(t)$ es una función de valores reales. Esto es $H = h + F \star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t < 0$.

Proposición 37.2.104 *La función $U \star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.2.157 (Teorema Renovación Elemental)

$$t^{-1}U(t) \to 1/\mu, \text{ cuando } t \to \infty.$$

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.2.219 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t) = \sum_{n=1}^{\infty} F^{n\star}(t),\ t \geq 0,$$

donde $F^{0\star}(t) = \mathbb{1}(t \geq 0)$.

Proposición 37.2.105 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t > 0$, y es $U^{'}(t) = \sum_{n=0}^{\infty} f^{n\star}(t)$. Además*

$$\mathbb{P}\left\{N(t) > N(t-)\right\} = 0,\ t \geq 0.$$

Definición 37.2.220 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha) = \int_{\mathbb{R}_+} e^{-\alpha t} dF(t),\ \alpha \geq 0.$$

Entonces

$$\hat{U}(\alpha) = \sum_{n=0}^{\infty} F^{\hat{n}\star}(\alpha) = \sum_{n=0}^{\infty} \hat{F}(\alpha)^n = \frac{1}{1-\hat{F}(\alpha)}.$$

Proposición 37.2.106 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha) = \frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.2.133 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}\left[U(t)\right] = \lambda t$, para $t \geq 0$.*

Teorema 37.2.158 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t) = \mathbb{E}\left[N()\right]$ es finita para cada t. Entonces para cualquier función $f : \mathbb{R}_+ \to \mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()} f(T_n)\right] = \int_{(0,t]} f(s)\, d\eta(s),\ t \geq 0,$$

suponiendo que la integral exista. Además si $X_1, X_2, \ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}\left[X_n | T_n = s\right] = f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)} X_n\right] = \int_{(0,t]} f(s)\, d\eta(s),\ t \geq 0,$$

suponiendo que la integral exista.

Corolario 37.2.80 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right] = \mu\mathbb{E}\left[N(t)+1\right],\ t \geq 0,$$

Definición 37.2.221 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t < 0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t) = h(t) + \int_{[0,t]} H(t-s)\, dF(s),\ t \geq 0, \tag{37.2.277}$$

donde $H(t)$ es una función de valores reales. Esto es $H = h + F \star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t < 0$.

Proposición 37.2.107 *La función $U \star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.2.159 (Teorema Renovación Elemental)

$$t^{-1}U(t) \to 1/\mu,\ cuando\ t \to \infty.$$

Nota 37.2.134 *Una función $h : \mathbb{R}_+ \to \mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ es decreciente y Riemann Integrable.

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)| \leq b(t)$, donde b es DRI.

Teorema 37.2.160 (Teorema Principal de Renovación) *Si F es no aritmética y $h(t)$ es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty} U \star h = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\, ds.$$

Proposición 37.2.108 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t < 0$ puede expresarse como*

$$H(t) = U \star h(t),\ donde\ h(t) = H(t) - F \star H(t)$$

Definición 37.2.222 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}\left[X(T+t)\,|T\right] = \mathbb{E}\left[X(t)\right],\ para\ t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.2.109 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}\left[X(t)\right] = U \star h(t),\ donde\ h(t) = \mathbb{E}\left[X(t)\,\mathbb{1}(T > t)\right].$$

Teorema 37.2.161 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M = \sup\{|X(t)| : t \leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}\left[X(t)\right] = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\, ds,$$

donde $h(t) = \mathbb{E}\left[X(t)\,\mathbb{1}(T > t)\right]$.

Nota 37.2.135 *Una función $h : \mathbb{R}_+ \to \mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ es decreciente y Riemann Integrable.

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)| \leq b(t)$, donde b es DRI.

Teorema 37.2.162 (Teorema Principal de Renovación) *Si F es no aritmética y $h(t)$ es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty} U \star h = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\, ds.$$

Proposición 37.2.110 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t<0$ puede expresarse como*

$$H(t) = U \star h(t), \text{ donde } h(t) = H(t) - F \star H(t)$$

Definición 37.2.223 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}[X(T+t)|T] = \mathbb{E}[X(t)], \text{ para } t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.2.111 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}[X(t)] = U \star h(t), \text{ donde } h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T>t)].$$

Teorema 37.2.163 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M = \sup\{|X(t)| : t \leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}[X(t)] = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds,$$

donde $h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T>t)]$.

Definición 37.2.224 *Para el proceso $\{(N(t), X(t)) : t \geq 0\}$, sus trayectoria muestrales en el intervalo de tiempo $[T_{n-1}, T_n)$ están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1}+t) : 0 \leq t < \xi_n\})$$

Este ζ_n es el n-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos T_n si sus segmentos ζ_n son independientes e idénticamennte distribuidos.

Nota 37.2.136 *Si $\tilde{X}(t)$ con espacio de estados $\tilde{S}$ es regenerativo sobre T_n, entonces $X(t) = f\left(\tilde{X}(t)\right)$ también es regenerativo sobre T_n, para cualquier función $f : \tilde{S} \to S$.*

Nota 37.2.137 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Nota 37.2.138 *Un proceso estocástico a tiempo continuo o discreto es regenerativo si existe un proceso de renovación tal que los segmentos del proceso entre tiempos de renovación sucesivos son i.i.d., es decir, para $\{X(t) : t \geq 0\}$ proceso estocástico a tiempo continuo con espacio de estados S, espacio métrico.*

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Definición 37.2.225 *Para el proceso $\{(N(t), X(t)) : t \geq 0\}$, sus trayectoria muestrales en el intervalo de tiempo $[T_{n-1}, T_n)$ están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1}+t) : 0 \leq t < \xi_n\})$$

Este ζ_n es el n-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos T_n si sus segmentos ζ_n son independientes e idénticamennte distribuidos.

Nota 37.2.139 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Teorema 37.2.164 (Procesos Regenerativos) *Suponga que el proceso*

Definición 37.2.226 (Renewal Process Trinity) *Para un proceso de renovación $N(t)$, los siguientes procesos proveen de información sobre los tiempos de renovación.*

- *$A(t) = t - T_{N(t)}$, el tiempo de recurrencia hacia atrás al tiempo t, que es el tiempo desde la última renovación para t.*
- *$B(t) = T_{N(t)+1} - t$, el tiempo de recurrencia hacia adelante al tiempo t, residual del tiempo de renovación, que es el tiempo para la próxima renovación después de t.*
- *$L(t) = \xi_{N(t)+1} = A(t) + B(t)$, la longitud del intervalo de renovación que contiene a t.*

Nota 37.2.140 *El proceso tridimensional* $(A(t), B(t), L(t))$ *es regenerativo sobre* T_n*, y por ende cada proceso lo es. Cada proceso* $A(t)$ *y* $B(t)$ *son procesos de MArkov a tiempo continuo con trayectorias continuas por partes en el espacio de estados* $\mathbb{R}_+$*. Una expresión conveniente para su distribución conjunta es, para* $0 \leq x < t, y \geq 0$

$$P\{A(t) > x, B(t) > y\} = P\{N(t+y) - N((t-x)) = 0\} \tag{37.2.278}$$

Ejemplo 37.2.6 (Tiempos de recurrencia Poisson) *Si* $N(t)$ *es un proceso Poisson con tasa* λ*, entonces de la expresión (37.8.10) se tiene que*

$$P\{A(t) > x, B(t) > y\} = e^{-\lambda(x+y)}, \quad 0 \leq x < t, y \geq 0,$$

que es la probabilidad Poisson de no renovaciones en un intervalo de longitud $x + y$*.*

Nota 37.2.141 *Una cadena de Markov ergódica tiene la propiedad de ser estacionaria si la distribución de su estado al tiempo* 0 *es su distribución estacionaria.*

Definición 37.2.227 *Un proceso estocástico a tiempo continuo* $\{X(t) : t \geq 0\}$ *en un espacio general es estacionario si sus distribuciones finito dimensionales son invariantes bajo cualquier traslado: para cada* $0 \leq s_1 < s_2 < \cdots < s_k$ *y* $t \geq 0$*,*

$$(X(s_1 + t), \ldots, X(s_k + t)) =_d (X(s_1), \ldots, X(s_k)).$$

Nota 37.2.142 *Un proceso de Markov es estacionario si* $X(t) =_d X(0)$*,* $t \geq 0$*.*

Considerese el proceso $N(t) = \sum_n 1\!\!1(\tau_n \leq t)$ en $\mathbb{R}_+$, con puntos $0 < \tau_1 < \tau_2 < \cdots$.

Proposición 37.2.112 *Si* N *es un proceso puntual estacionario y* $\mathbb{E}[N(1)] < \infty$*, entonces* $\mathbb{E}[N(t)] = t\mathbb{E}[N(1)]$*,* $t \geq 0$

Teorema 37.2.165 *Los siguientes enunciados son equivalentes*

i) *El proceso retardado de renovación* N *es estacionario.*

ii) *EL proceso de tiempos de recurrencia hacia adelante* $B(t)$ *es estacionario.*

iii) $\mathbb{E}[N(t)] = t/\mu$*,*

iv) $G(t) = F_e(t) = \frac{1}{\mu}\int_0^t [1 - F(s)]\, ds$

Cuando estos enunciados son ciertos, $P\{B(t) \leq x\} = F_e(x)$*, para* $t, x \geq 0$*.*

Nota 37.2.143 *Una consecuencia del teorema anterior es que el Proceso Poisson es el único proceso sin retardo que es estacionario.*

Corolario 37.2.81 *El proceso de renovación* $N(t)$ *sin retardo, y cuyos tiempos de inter renonación tienen media finita, es estacionario si y sólo si es un proceso Poisson.*

Nota 37.2.144 *Si* $\tilde{X}(t)$ *con espacio de estados* $\tilde{S}$ *es regenerativo sobre* T_n*, entonces* $X(t) = f\left(\tilde{X}(t)\right)$ *también es regenerativo sobre* T_n*, para cualquier función* $f : \tilde{S} \to S$*.*

Nota 37.2.145 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Definición 37.2.228 (Definición Clásica) *Un proceso estocástico* $X = \{X(t) : t \geq 0\}$ *es llamado regenerativo is existe una variable aleatoria* $R_1 > 0$ *tal que*

i) $\{X(t + R_1) : t \geq 0\}$ *es independiente de* $\{\{X(t) : t < R_1\},\}$

ii) $\{X(t + R_1) : t \geq 0\}$ *es estocásticamente equivalente a* $\{X(t) : t > 0\}$

Llamamos a R_1 *tiempo de regeneración, y decimos que* X *se regenera en este punto.*

$\{X(t + R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Definición 37.2.229 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty X(u)\,du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty I_x(u)\,du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\,dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.2.146 *a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.*

b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Definición 37.2.230 *Para el proceso $\{(N(t), X(t)) : t \geq 0\}$, sus trayectoria muestrales en el intervalo de tiempo $[T_{n-1}, T_n)$ están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1} + t) : 0 \leq t < \xi_n\})$$

Este ζ_n es el n-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos T_n si sus segmentos ζ_n son independientes e idénticamennte distribuidos.

Nota 37.2.147 *Si $\tilde{X}(t)$ con espacio de estados $\tilde{S}$ es regenerativo sobre T_n, entonces $X(t) = f\left(\tilde{X}(t)\right)$ también es regenerativo sobre T_n, para cualquier función $f : \tilde{S} \to S$.*

Nota 37.2.148 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Definición 37.2.231 (Definición Clásica) *Un proceso estocástico $X = \{X(t) : t \geq 0\}$ es llamado regenerativo is existe una variable aleatoria $R_1 > 0$ tal que*

i) $\{X(t + R_1) : t \geq 0\}$ es independiente de $\{\{X(t) : t < R_1\},\}$

ii) $\{X(t + R_1) : t \geq 0\}$ es estocásticamente equivalente a $\{X(t) : t > 0\}$

Llamamos a R_1 tiempo de regeneración, y decimos que X se regenera en este punto.

$\{X(t + R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Nota 37.2.149 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Definición 37.2.232 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty X(u)\,du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty I_x(u)\,du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\,dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.2.150 *a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.*

b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\{V(t-s) \in A | X_1 > t - s\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones (*puntos de regeneración*) que ocurren en $[0, t]$. El intervalo $[0, X_1)$ es llamado *primer ciclo de regeneración* de $\{V(t), t \geq 0\}$, $[X_1, X_1 + X_2)$ el *segundo ciclo de regeneración*, y así sucesivamente.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 37.2.233 *Se define el proceso estacionario, $\{V^*(t), t \geq 0\}$, para $\{V(t), t \geq 0\}$ por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]} \int_0^\infty \mathbb{P}\{V(t+x) \in A | X > x\}(1 - F(x))\,dx,$$

para todo $t \geq 0$ y todo conjunto de Borel A.

Definición 37.2.234 *Una distribución se dice que es* aritmética *si todos sus puntos de incremento son múltiplos de la forma $0, \lambda, 2\lambda, \ldots$ para alguna $\lambda > 0$ entera.*

Definición 37.2.235 *Una modificación medible de un proceso $\{V(t), t \geq 0\}$, es una versión de este, $\{V(t, w)\}$ conjuntamente medible para $t \geq 0$ y para $w \in S$, S espacio de estados para $\{V(t), t \geq 0\}$.*

Teorema 37.2.166 *Sea $\{V(t), t \geq\}$ un proceso regenerativo no negativo con modificación medible. Sea $\mathbb{E}[X] < \infty$. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de t, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$, equivalentemente, si $\mathbb{E}\left[\int_0^X V(s)\,ds\right] < \infty$,entonces

$$\frac{\int_0^t V(s)\,ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$.

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\{V(t-s) \in A | X_1 > t - s\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones (*puntos de regeneración*) que ocurren en $[0, t]$. El intervalo $[0, X_1)$ es llamado *primer ciclo de regeneración* de $\{V(t), t \geq 0\}$, $[X_1, X_1 + X_2)$ el *segundo ciclo de regeneración*, y así sucesivamente.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 37.2.236 *Se define el proceso estacionario, $\{V^*(t), t \geq 0\}$, para $\{V(t), t \geq 0\}$ por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]} \int_0^\infty \mathbb{P}\{V(t+x) \in A | X > x\} (1 - F(x))\, dx,$$

para todo $t \geq 0$ y todo conjunto de Borel A.

Definición 37.2.237 *Una distribución se dice que es* aritmética *si todos sus puntos de incremento son múltiplos de la forma $0, \lambda, 2\lambda, \ldots$ para alguna $\lambda > 0$ entera.*

Definición 37.2.238 *Una modificación medible de un proceso $\{V(t), t \geq 0\}$, es una versión de este, $\{V(t,w)\}$ conjuntamente medible para $t \geq 0$ y para $w \in S$, S espacio de estados para $\{V(t), t \geq 0\}$.*

Teorema 37.2.167 *Sea $\{V(t), t \geq\}$ un proceso regenerativo no negativo con modificación medible. Sea $\mathbb{E}[X] < \infty$. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de t, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\, ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$, equivalentemente, si $\mathbb{E}\left[\int_0^X V(s)\, ds\right] < \infty$,entonces

$$\frac{\int_0^t V(s)\, ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\, ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$.

Sea la función generadora de momentos para L_i, el número de usuarios en la cola $Q_i(z)$ en cualquier momento, está dada por el tiempo promedio de $z^{L_i(t)}$ sobre el ciclo regenerativo definido anteriormente. Entonces

Es decir, es posible determinar las longitudes de las colas a cualquier tiempo t. Entonces, determinando el primer momento es posible ver que

Definición 37.2.239 *El tiempo de Ciclo C_i es el periodo de tiempo que comienza cuando la cola i es visitada por primera vez en un ciclo, y termina cuando es visitado nuevamente en el próximo ciclo. La duración del mismo está dada por $\tau_i(m+1) - \tau_i(m)$, o equivalentemente $\overline{\tau}_i(m+1) - \overline{\tau}_i(m)$ bajo condiciones de estabilidad.*

Definición 37.2.240 *El tiempo de intervisita I_i es el periodo de tiempo que comienza cuando se ha completado el servicio en un ciclo y termina cuando es visitada nuevamente en el próximo ciclo. Su duración del mismo está dada por $\tau_i(m+1) - \overline{\tau}_i(m)$.*

La duración del tiempo de intervisita es $\tau_i(m+1) - \overline{\tau}(m)$. Dado que el número de usuarios presentes en Q_i al tiempo $t = \tau_i(m+1)$ es igual al número de arribos durante el intervalo de tiempo $[\overline{\tau}(m), \tau_i(m+1)]$ se tiene que

$$\mathbb{E}\left[z_i^{L_i(\tau_i(m+1))}\right] = \mathbb{E}\left[\{P_i(z_i)\}^{\tau_i(m+1) - \overline{\tau}(m)}\right]$$

entonces, si $I_i(z) = \mathbb{E}\left[z^{\tau_i(m+1) - \overline{\tau}(m)}\right]$ se tiene que $F_i(z) = I_i[P_i(z)]$ para $i = 1, 2$.

Conforme a la definición dada al principio del capítulo, definición (37.8.1), sean $T_1, T_2, \ldots$ los puntos donde las longitudes de las colas de la red de sistemas de visitas cíclicas son cero simultáneamente, cuando la cola Q_j es visitada por el servidor para dar servicio, es decir, $L_1(T_i) = 0, L_2(T_i) = 0, \hat{L}_1(T_i) = 0$ y $\hat{L}_2(T_i) = 0$, a estos puntos se les denominará puntos regenerativos. Entonces,

Definición 37.2.241 *Al intervalo de tiempo entre dos puntos regenerativos se le llamará ciclo regenerativo.*

Definición 37.2.242 *Para T_i se define, M_i, el número de ciclos de visita a la cola Q_l, durante el ciclo regenerativo, es decir, M_i es un proceso de renovación.*

Definición 37.2.243 *Para cada uno de los M_i's, se definen a su vez la duración de cada uno de estos ciclos de visita en el ciclo regenerativo, $C_i^{(m)}$, para $m = 1, 2, \ldots, M_i$, que a su vez, también es n proceso de renovación.*

[2]

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Definición 37.2.244 *Un elemento aleatorio en un espacio medible $(E, \mathcal{E})$ en un espacio de probabilidad $(\Omega, \mathcal{F}, \mathbb{P})$ a $(E, \mathcal{E})$, es decir, para $A \in \mathcal{E}$, se tiene que $\{Y \in A\} \in \mathcal{F}$, donde $\{Y \in A\} := \{w \in \Omega : Y(w) \in A\} =: Y^{-1}A$.*

Nota 37.2.151 *También se dice que Y está soportado por el espacio de probabilidad $(\Omega, \mathcal{F}, \mathbb{P})$ y que Y es un mapeo medible de Ω en E, es decir, es $\mathcal{F}/\mathcal{E}$ medible.*

Definición 37.2.245 *Para cada $i \in \mathbb{I}$ sea P_i una medida de probabilidad en un espacio medible $(E_i, \mathcal{E}_i)$. Se define el espacio producto $\otimes_{i\in\mathbb{I}}(E_i, \mathcal{E}_i) := \left(\prod_{i\in\mathbb{I}} E_i, \otimes_{i\in\mathbb{I}}\mathcal{E}_i\right)$, donde $\prod_{i\in\mathbb{I}} E_i$ es el producto cartesiano de los E_i's, y $\otimes_{i\in\mathbb{I}}\mathcal{E}_i$ es la σ-álgebra producto, es decir, es la σ-álgebra más pequeña en $\prod_{i\in\mathbb{I}} E_i$ que hace al i-ésimo mapeo proyección en E_i medible para toda $i \in \mathbb{I}$ es la σ-álgebra inducida por los mapeos proyección.*

$$\otimes_{i\in\mathbb{I}}\mathcal{E}_i := \sigma\left\{\{y : y_i \in A\} : i \in \mathbb{I} \text{ y } A \in \mathcal{E}_i\right\}.$$

Definición 37.2.246 *Un espacio de probabilidad $\left(\tilde{\Omega}, \tilde{\mathcal{F}}, \tilde{\mathbb{P}}\right)$ es una extensión de otro espacio de probabilidad $(\Omega, \mathcal{F}, \mathbb{P})$ si $\left(\tilde{\Omega}, \tilde{\mathcal{F}}, \tilde{\mathbb{P}}\right)$ soporta un elemento aleatorio $\xi \in (\Omega, \mathcal{F})$ que tienen a $\mathbb{P}$ como distribución.*

Teorema 37.2.168 *Sea $\mathbb{I}$ un conjunto de índices arbitrario. Para cada $i \in \mathbb{I}$ sea P_i una medida de probabilidad en un espacio medible $(E_i, \mathcal{E}_i)$. Entonces existe una única medida de probabilidad $\otimes_{i\in\mathbb{I}}P_i$ en $\otimes_{i\in\mathbb{I}}(E_i, \mathcal{E}_i)$ tal que*

$$\otimes_{i\in\mathbb{I}}P_i\left(y \in \prod_{i\in\mathbb{I}} E_i : y_i \in A_{i_1}, \ldots, y_n \in A_{i_n}\right) = P_{i_1}(A_{i_n}) \cdots P_{i_n}(A_{i_n})$$

para todos los enteros $n > 0$, toda $i_1, \ldots, i_n \in \mathbb{I}$ y todo $A_{i_1} \in \mathcal{E}_{i_1}, \ldots, A_{i_n} \in \mathcal{E}_{i_n}$

La medida $\otimes_{i\in\mathbb{I}}P_i$ es llamada la medida producto y $\otimes_{i\in\mathbb{I}}(E_i, \mathcal{E}_i, P_i) := \left(\prod_{i\in\mathbb{I}}, E_i, \otimes_{i\in\mathbb{I}}\mathcal{E}_i, \otimes_{i\in\mathbb{I}}P_i\right)$, es llamado espacio de probabilidad producto.

Definición 37.2.247 *Un espacio medible $(E, \mathcal{E})$ es Polaco si existe una métrica en E tal que E es completo, es decir cada sucesión de Cauchy converge a un límite en E, y separable, E tienen un subconjunto denso numerable, y tal que $\mathcal{E}$ es generado por conjuntos abiertos.*

Definición 37.2.248 *Dos espacios medibles $(E, \mathcal{E})$ y $(G, \mathcal{G})$ son Borel equivalentes isomorfos si existe una biyección $f : E \to G$ tal que f es $\mathcal{E}/\mathcal{G}$ medible y su inversa f^{-1} es $\mathcal{G}/\mathcal{E}$ medible. La biyección es una equivalencia de Borel.*

Definición 37.2.249 *Un espacio medible $(E, \mathcal{E})$ es un espacio estándar si es Borel equivalente a $(G, \mathcal{G})$, donde G es un subconjunto de Borel de $[0, 1]$ y $\mathcal{G}$ son los subconjuntos de Borel de G.*

Nota 37.2.152 *Cualquier espacio Polaco es un espacio estándar.*

Definición 37.2.250 *Un proceso estocástico con conjunto de índices $\mathbb{I}$ y espacio de estados $(E, \mathcal{E})$ es una familia $Z = (\mathbb{Z}_s)_{s\in\mathbb{I}}$ donde $\mathbb{Z}_s$ son elementos aleatorios definidos en un espacio de probabilidad común $(\Omega, \mathcal{F}, \mathbb{P})$ y todos toman valores en $(E, \mathcal{E})$.*

Definición 37.2.251 *Un proceso estocástico one-sided contiuous time (**PEOSCT**) es un proceso estocástico con conjunto de índices $\mathbb{I} = [0, \infty)$.*

Sea $\left(E^{\mathbb{I}}, \mathcal{E}^{\mathbb{I}}\right)$ denota el espacio producto $\left(E^{\mathbb{I}}, \mathcal{E}^{\mathbb{I}}\right) := \otimes_{s\in\mathbb{I}}(E, \mathcal{E})$. Vamos a considerar $\mathbb{Z}$ como un mapeo aleatorio, es decir, como un elemento aleatorio en $\left(E^{\mathbb{I}}, \mathcal{E}^{\mathbb{I}}\right)$ definido por $Z(w) = (Z_s(w))_{s\in\mathbb{I}}$ y $w \in \Omega$.

[2] In Stidham and Heyman [41] shows that is sufficient for the regenerative process to be stationary that the mean regenerative cycle time is finite: $\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right] < \infty$,

como cada $C_i^{(m)}$ contiene intervalos de réplica positivos, se tiene que $\mathbb{E}[M_i] < \infty$, además, como $M_i > 0$, se tiene que la condición anterior es equivalente a tener que $\mathbb{E}[C_i] < \infty$, por lo tanto una condición suficiente para la existencia del proceso regenerativo está dada por $\sum_{k=1}^{N} \mu_k < 1$.

Nota 37.2.153 *La distribución de un proceso estocástico Z es la distribución de Z como un elemento aleatorio en $\left(E^{\mathbb{I}},\mathcal{E}^{\mathbb{I}}\right)$. La distribución de Z esta determinada de manera única por las distribuciones finito dimensionales.*

Nota 37.2.154 *En particular cuando Z toma valores reales, es decir, $(E,\mathcal{E})=(\mathbb{R},\mathcal{B})$ las distribuciones finito dimensionales están determinadas por las funciones de distribución finito dimensionales*

$$\mathbb{P}\left(Z_{t_1}\leq x_1,\ldots,Z_{t_n}\leq x_n\right),x_1,\ldots,x_n\in\mathbb{R},t_1,\ldots,t_n\in\mathbb{I},n\geq 1. \tag{37.2.279}$$

Nota 37.2.155 *Para espacios polacos $(E,\mathcal{E})$ el Teorema de Consistencia de Kolmogorov asegura que dada una colección de distribuciones finito dimensionales consistentes, siempre existe un proceso estocástico que posee tales distribuciones finito dimensionales.*

Definición 37.2.252 *Las trayectorias de Z son las realizaciones $Z(w)$ para $w\in\Omega$ del mapeo aleatorio Z.*

Nota 37.2.156 *Algunas restricciones se imponen sobre las trayectorias, por ejemplo que sean continuas por la derecha, o continuas por la derecha con límites por la izquierda, o de manera más general, se pedirá que caigan en algún subconjunto H de $E^{\mathbb{I}}$. En este caso es natural considerar a Z como un elemento aleatorio que no está en $\left(E^{\mathbb{I}},\mathcal{E}^{\mathbb{I}}\right)$ sino en $(H,\mathcal{H})$, donde $\mathcal{H}$ es la σ-álgebra generada por los mapeos proyección que toman a $z\in H$ a $z_t\in E$ para $t\in\mathbb{I}$. A $\mathcal{H}$ se le conoce como la traza de H en $E^{\mathbb{I}}$, es decir,*

$$\mathcal{H}:=E^{\mathbb{I}}\cap H:=\left\{A\cap H:A\in E^{\mathbb{I}}\right\}. \tag{37.2.280}$$

Nota 37.2.157 *Z tiene trayectorias con valores en H y cada Z_t es un mapeo medible de $(\Omega,\mathcal{F})$ a $(H,\mathcal{H})$. Cuando se considera un espacio de trayectorias en particular H, al espacio $(H,\mathcal{H})$ se le llama el espacio de trayectorias de Z.*

Nota 37.2.158 *La distribución del proceso estocástico Z con espacio de trayectorias $(H,\mathcal{H})$ es la distribución de Z como un elemento aleatorio en $(H,\mathcal{H})$. La distribución, nuevemente, está determinada de manera única por las distribuciones finito dimensionales.*

Definición 37.2.253 *Sea Z un PEOSCT con espacio de estados $(E,\mathcal{E})$ y sea T un tiempo aleatorio en $[0,\infty)$. Por Z_T se entiende el mapeo con valores en E definido en Ω en la manera obvia:*

$$Z_T(w):=Z_{T(w)}(w).w\in\Omega.$$

Definición 37.2.254 *Un PEOSCT Z es conjuntamente medible (**CM**) si el mapeo que toma $(w,t)\in\Omega\times[0,\infty)$ a $Z_t(w)\in E$ es $\mathcal{F}\otimes\mathcal{B}[0,\infty)/\mathcal{E}$ medible.*

Nota 37.2.159 *Un PEOSCT-CM implica que el proceso es medible, dado que Z_T es una composición de dos mapeos continuos: el primero que toma w en $(w,T(w))$ es $\mathcal{F}/\mathcal{F}\otimes\mathcal{B}[0,\infty)$ medible, mientras que el segundo toma $(w,T(w))$ en $Z_{T(w)}(w)$ es $\mathcal{F}\otimes\mathcal{B}[0,\infty)/\mathcal{E}$ medible.*

Definición 37.2.255 *Un PEOSCT con espacio de estados $(H,\mathcal{H})$ es canónicamente conjuntamente medible (**CCM**) si el mapeo $(z,t)\in H\times[0,\infty)$ en $Z_t\in E$ es $\mathcal{H}\otimes\mathcal{B}[0,\infty)/\mathcal{E}$ medible.*

Nota 37.2.160 *Un PEOSCTCCM implica que el proceso es CM, dado que un PECCM Z es un mapeo de $\Omega\times[0,\infty)$ a E, es la composición de dos mapeos medibles: el primero, toma (w,t) en $(Z(w),t)$ es $\mathcal{F}\otimes\mathcal{B}[0,\infty)/\mathcal{H}\otimes\mathcal{B}[0,\infty)$ medible, y el segundo que toma $(Z(w),t)$ en $Z_t(w)$ es $\mathcal{H}\otimes\mathcal{B}[0,\infty)/\mathcal{E}$ medible. Por tanto CCM es una condición más fuerte que CM.*

Definición 37.2.256 *Un conjunto de trayectorias H de un PEOSCT Z, es internamente shift-invariante (**ISI**) si*

$$\left\{(z_{t+s})_{s\in[0,\infty)}:z\in H\right\}=H,\ t\in[0,\infty).$$

Definición 37.2.257 *Dado un PEOSCTISI, se define el mapeo-shift θ_t, $t\in[0,\infty)$, de H a H por*

$$\theta_t z=(z_{t+s})_{s\in[0,\infty)},\ z\in H.$$

Definición 37.2.258 *Se dice que un proceso Z es shift-medible (**SM**) si Z tiene un conjunto de trayectorias H que es ISI y además el mapeo que toma $(z,t)\in H\times[0,\infty)$ en $\theta_t z\in H$ es $\mathcal{H}\otimes\mathcal{B}[0,\infty)/\mathcal{H}$ medible.*

Nota 37.2.161 *Un proceso estocástico con conjunto de trayectorias H ISI es shift-medible si y sólo si es CCM*

Nota 37.2.162
- *Dado el espacio polaco $(E, \mathcal{E})$ se tiene el conjunto de trayectorias $D_E[0,\infty)$ que es ISI, entonces cumpe con ser CCM.*
- *Si G es abierto, podemos cubrirlo por bolas abiertas cuay cerradura este contenida en G, y como G es segundo numerable como subespacio de E, lo podemos cubrir por una cantidad numerable de bolas abiertas.*

Nota 37.2.163 *Los procesos estocásticos Z a tiempo discreto con espacio de estados polaco, también tiene un espacio de trayectorias polaco y por tanto tiene distribuciones condicionales regulares.*

Teorema 37.2.169 *El producto numerable de espacios polacos es polaco.*

Definición 37.2.259 *Sea $(\Omega, \mathcal{F}, \mathbb{P})$ espacio de probabilidad que soporta al proceso $Z = (Z_s)_{s\in[0,\infty)}$ y $S = (S_k)_0^\infty$ donde Z es un PEOSCTM con espacio de estados $(E, \mathcal{E})$ y espacio de trayectorias $(H, \mathcal{H})$ y además S es una sucesión de tiempos aleatorios one-sided que satisfacen la condición $0 \leq S_0 < S_1 < \cdots \to \infty$. Considerando S como un mapeo medible de $(\Omega, \mathcal{F})$ al espacio sucesión $(L, \mathcal{L})$, donde*

$$L = \left\{ (s_k)_0^\infty \in [0,\infty)^{\{0,1,\ldots\}} : s_0 < s_1 < \cdots \to \infty \right\},$$

donde $\mathcal{L}$ son los subconjuntos de Borel de L, es decir, $\mathcal{L} = L \cap \mathcal{B}^{\{0,1,\ldots\}}$.

Así el par (Z, S) es un mapeo medible de $(\Omega, \mathcal{F})$ en $(H \times L, \mathcal{H} \otimes \mathcal{L})$. El par $\mathcal{H} \otimes \mathcal{L}^+$ denotará la clase de todas las funciones medibles de $(H \times L, \mathcal{H} \otimes \mathcal{L})$ en $([0,\infty), \mathcal{B}[0,\infty))$.

Definición 37.2.260 *Sea θ_t el mapeo-shift conjunto de $H \times L$ en $H \times L$ dado por*

$$\theta_t\left(z, (s_k)_0^\infty\right) = \theta_t\left(z, \left(s_{n_{t-}+k} - t\right)_0^\infty\right)$$

donde $n_{t-} = inf\{n \geq 1 : s_n \geq t\}$.

Nota 37.2.164 *Con la finalidad de poder realizar los shift's sin complicaciones de medibilidad, se supondrá que Z es shit-medible, es decir, el conjunto de trayectorias H es invariante bajo shifts del tiempo y el mapeo que toma $(z,t) \in H \times [0,\infty)$ en $z_t \in E$ es $\mathcal{H} \otimes \mathcal{B}[0,\infty)/\mathcal{E}$ medible.*

Definición 37.2.261 *Dado un proceso **PEOSSM** (Proceso Estocástico One Side Shift Medible) Z, se dice regenerativo clásico con tiempos de regeneración S si*

$$\theta_{S_n}(Z, S) = \left(Z^0, S^0\right), n \geq 0$$

y además $\theta_{S_n}(Z, S)$ es independiente de $((Z_s)\, s \in [0, S_n), S_0, \ldots, S_n)$ Si lo anterior se cumple, al par (Z, S) se le llama regenerativo clásico.

Nota 37.2.165 *Si el par (Z, S) es regenerativo clásico, entonces las longitudes de los ciclos $X_1, X_2, \ldots,$ son i.i.d. e independientes de la longitud del retraso S_0, es decir, S es un proceso de renovación. Las longitudes de los ciclos también son llamados tiempos de inter-regeneración y tiempos de ocurrencia.*

Teorema 37.2.170 *Supóngase que el par (Z, S) es regenerativo clásico con $\mathbb{E}[X_1] < \infty$. Entonces (Z^*, S^*) en el teorema 2.1 es una versión estacionaria de (Z, S). Además, si X_1 es lattice con span d, entonces (Z^{**}, S^{**}) en el teorema 2.2 es una versión periodicamente estacionaria de (Z, S) con periodo d.*

Definición 37.2.262 *Una variable aleatoria X_1 es spread out si existe una $n \geq 1$ y una función $f \in \mathcal{B}^+$ tal que $\int_{\mathbb{R}} f(x)\, dx > 0$ con $X_2, X_3, \ldots, X_n$ copias i.i.d de X_1,*

$$\mathbb{P}(X_1 + \cdots + X_n \in B) \geq \int_B f(x)\, dx$$

para $B \in \mathcal{B}$.

Definición 37.2.263 *Dado un proceso estocástico Z se le llama wide-sense regenerative (**WSR**) con tiempos de regeneración S si $\theta_{S_n}(Z, S) = \left(Z^0, S^0\right)$ para $n \geq 0$ en distribución y $\theta_{S_n}(Z, S)$ es independiente de $(S_0, S_1, \ldots, S_n)$ para $n \geq 0$. Se dice que el par (Z, S) es WSR si lo anterior se cumple.*

Nota 37.2.166
- *El proceso de trayectorias $(\theta_s Z)_{s\in[0,\infty)}$ es WSR con tiempos de regeneración S pero no es regenerativo clásico.*
- *Si Z es cualquier proceso estacionario y S es un proceso de renovación que es independiente de Z, entonces (Z, S) es WSR pero en general no es regenerativo clásico*

Nota 37.2.167 *Para cualquier proceso estocástico Z, el proceso de trayectorias $(\theta_s Z)_{s\in[0,\infty)}$ es siempre un proceso de Markov.*

Teorema 37.2.171 *Supongase que el par (Z,S) es WSR con $\mathbb{E}[X_1]<\infty$. Entonces (Z^*,S^*) en el teorema 2.1 es una versión estacionaria de (Z,S).*

Teorema 37.2.172 *Supongase que (Z,S) es cycle-stationary con $\mathbb{E}[X_1]<\infty$. Sea U distribuida uniformemente en $[0,1)$ e independiente de $\left(Z^0,S^0\right)$ y sea $\mathbb{P}^*$ la medida de probabilidad en $(\Omega,\mathbb{P})$ definida por*

$$d\mathbb{P}^* = \frac{X_1}{\mathbb{E}[X_1]} d\mathbb{P}$$

. Sea (Z^*,S^*) con distribución $\mathbb{P}^*\left(\theta_{UX_1}\left(Z^0,S^0\right)\in\cdot\right)$. Entonces $(Z*,S^*)$ es estacionario,

$$\mathbb{E}\left[f\left(Z^*,S^*\right)\right] = \mathbb{E}\left[\int_0^{X_1} f\left(\theta_s\left(Z^0,S^0\right)\right)ds\right]/\mathbb{E}[X_1]$$

$f\in\mathcal{H}\otimes\mathcal{L}^+$, and S_0^* es continuo con función distribución G_∞ definida por

$$G_\infty(x) := \frac{\mathbb{E}[X_1]\wedge x}{\mathbb{E}[X_1]}$$

para $x\geq 0$ y densidad $\mathbb{P}[X_1>x]/\mathbb{E}[X_1]$, con $x\geq 0$.

Teorema 37.2.173 *Sea Z un Proceso Estocástico un lado shift-medible one-sided shift-measurable stochastic process, (PEOSSM), y S_0 y S_1 tiempos aleatorios tales que $0\leq S_0<S_1$ y*

$$\theta_{S_1}Z = \theta_{S_0}Z \text{ en distribución.} \tag{37.2.281}$$

Entonces el espacio de probabilidad subyacente $(\Omega,\mathcal{F},\mathbb{P})$ puede extenderse para soportar una sucesión de tiempos aleatorios S tales que

$$\theta_{S_n}(Z,S) = \left(Z^0,S^0\right), n\geq 0, \text{ en distribución,} \tag{37.2.282}$$

$$(Z,S_0,S_1) \text{ depende de } (X_2,X_3,\ldots) \text{ solamente a traves de } \theta_{S_1}Z. \tag{37.2.283}$$

Also the intervisit time I_i is defined as the period beginning at the time of its service completion in a cycle and ending at the time when it is polled in the next cycle; its duration is given by $\tau_i(m+1)-\overline{\tau}_i(m)$.

So we the following are still true

$$\begin{array}{ll}
\mathbb{E}[L_i] = \mu_i\mathbb{E}[I_i], & \mathbb{E}[C_i] = \frac{f_i(i)}{\mu_i(1-\mu_i)}, \\
\mathbb{E}[S_i] = \mu_i\mathbb{E}[C_i], & \mathbb{E}[I_i] = (1-\mu_i)\,\mathbb{E}[C_i], \\
Var[L_i] = \mu_i^2 Var[I_i] + \sigma^2\mathbb{E}[I_i], & Var[C_i] = \frac{Var\left[L_i^*\right]}{\mu_i^2(1-\mu_i)^2}, \\
Var[S_i] = \frac{Var\left[L_i^*\right]}{(1-\mu_i)^2} + \frac{\sigma^2\mathbb{E}\left[L_i^*\right]}{(1-\mu_i)^3}, & Var[I_i] = \frac{Var\left[L_i^*\right]}{\mu_i^2} - \frac{\sigma_i^2}{\mu_i^2}f_i(i).
\end{array} \tag{37.2.284}$$

Definición 37.2.264 *El tiempo de Ciclo C_i es el periodo de tiempo que comienza cuando la cola i es visitada por primera vez en un ciclo, y termina cuando es visitado nuevamente en el próximo ciclo. La duración del mismo está dada por $\tau_i(m+1)-\tau_i(m)$, o equivalentemente $\overline{\tau}_i(m+1)-\overline{\tau}_i(m)$ bajo condiciones de estabilidad.*

Definición 37.2.265 *El tiempo de intervisita I_i es el periodo de tiempo que comienza cuando se ha completado el servicio en un ciclo y termina cuando es visitada nuevamente en el próximo ciclo. Su duración del mismo está dada por $\tau_i(m+1)-\overline{\tau}_i(m)$.*

La duración del tiempo de intervisita es $\tau_i(m+1)-\overline{\tau}(m)$. Dado que el número de usuarios presentes en Q_i al tiempo $t=\tau_i(m+1)$ es igual al número de arribos durante el intervalo de tiempo $[\overline{\tau}(m),\tau_i(m+1)]$ se tiene que

$$\mathbb{E}\left[z_i^{L_i(\tau_i(m+1))}\right] = \mathbb{E}\left[\{P_i(z_i)\}^{\tau_i(m+1)-\overline{\tau}(m)}\right]$$

entonces, si $I_i(z) = \mathbb{E}\left[z^{\tau_i(m+1)-\overline{\tau}(m)}\right]$ se tiene que $F_i(z) = I_i[P_i(z)]$ para $i=1,2$.

Conforme a la definición dada al principio del capítulo, definición (37.8.1), sean $T_1,T_2,\ldots$ los puntos donde las longitudes de las colas de la red de sistemas de visitas cíclicas son cero simultáneamente, cuando la cola Q_j es visitada por el servidor para dar servicio, es decir, $L_1(T_i)=0, L_2(T_i)=0, \hat{L}_1(T_i)=0$ y $\hat{L}_2(T_i)=0$, a estos puntos se les denominará puntos regenerativos. Entonces,

Definición 37.2.266 *Al intervalo de tiempo entre dos puntos regenerativos se le llamará ciclo regenerativo.*

Definición 37.2.267 *Para T_i se define, M_i, el número de ciclos de visita a la cola Q_l, durante el ciclo regenerativo, es decir, M_i es un proceso de renovación.*

Definición 37.2.268 *Para cada uno de los M_i's, se definen a su vez la duración de cada uno de estos ciclos de visita en el ciclo regenerativo, $C_i^{(m)}$, para $m = 1, 2, \ldots, M_i$, que a su vez, también es n proceso de renovación.*

Sea la función generadora de momentos para L_i, el número de usuarios en la cola $Q_i(z)$ en cualquier momento, está dada por el tiempo promedio de $z^{L_i(t)}$ sobre el ciclo regenerativo definido anteriormente:

$$Q_i(z) = \mathbb{E}\left[z^{L_i(t)}\right] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i}\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}\left[\sum_{m=1}^{M_i}\tau_i(m+1)-\tau_i(m)\right]}$$

M_i es un tiempo de paro en el proceso regenerativo con $\mathbb{E}[M_i] < \infty$[3], se sigue del lema de Wald que:

$$\begin{aligned}
\mathbb{E}\left[\sum_{m=1}^{M_i}\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}[M_i]\,\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] \\
\mathbb{E}\left[\sum_{m=1}^{M_i}\tau_i(m+1)-\tau_i(m)\right] &= \mathbb{E}[M_i]\,\mathbb{E}[\tau_i(m+1)-\tau_i(m)]
\end{aligned}$$

por tanto se tiene que

$$Q_i(z) = \frac{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}[\tau_i(m+1)-\tau_i(m)]}$$

observar que el denominador es simplemente la duración promedio del tiempo del ciclo.

Haciendo las siguientes sustituciones en la ecuación (**??**): $n \to t - \tau_i(m)$, $T \to \overline{\tau}_i(m) - \tau_i(m)$, $L_n \to L_i(t)$ y $F(z) = \mathbb{E}\left[z^{L_0}\right] \to F_i(z) = \mathbb{E}\left[z^{L_i\tau_i(m)}\right]$, se puede ver que

$$\mathbb{E}\left[\sum_{n=0}^{T-1} z^{L_n}\right] = \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\overline{\tau}_i(m)-1} z^{L_i(t)}\right] = z\frac{F_i(z)-1}{z-P_i(z)} \tag{37.2.285}$$

Por otra parte durante el tiempo de intervisita para la cola i, $L_i(t)$ solamente se incrementa de manera que el incremento por intervalo de tiempo está dado por la función generadora de probabilidades de $P_i(z)$, por tanto la suma sobre el tiempo de intervisita puede evaluarse como:

$$\begin{aligned}
\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} \{P_i(z)\}^{t-\overline{\tau}_i(m)}\right] = \frac{1-\mathbb{E}\left[\{P_i(z)\}^{\tau_i(m+1)-\overline{\tau}_i(m)}\right]}{1-P_i(z)} \\
&= \frac{1-I_i[P_i(z)]}{1-P_i(z)}
\end{aligned}$$

por tanto

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = \frac{1-F_i(z)}{1-P_i(z)}$$

Por lo tanto

[3]En Stidham[41] y Heyman se muestra que una condición suficiente para que el proceso regenerativo estacionario sea un procesoo estacionario es que el valor esperado del tiempo del ciclo regenerativo sea finito, es decir: $\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right] < \infty$, como cada $C_i^{(m)}$ contiene intervalos de réplica positivos, se tiene que $\mathbb{E}[M_i] < \infty$, además, como $M_i > 0$, se tiene que la condición anterior es equivalente a tener que $\mathbb{E}[C_i] < \infty$, por lo tanto una condición suficiente para la existencia del proceso regenerativo está dada por $\sum_{k=1}^{N}\mu_k < 1$.

$$\begin{aligned}
Q_i(z) &= \frac{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}\left[\tau_i(m+1)-\tau_i(m)\right]} = \frac{1}{\mathbb{E}\left[\tau_i(m+1)-\tau_i(m)\right]}\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] \\
&= \frac{1}{\mathbb{E}\left[\tau_i(m+1)-\tau_i(m)\right]}\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\overline{\tau}_i(m)-1} z^{L_i(t)} + \sum_{t=\overline{\tau}_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] \\
&= \frac{1}{\mathbb{E}\left[\tau_i(m+1)-\tau_i(m)\right]}\left\{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\overline{\tau}_i(m)-1} z^{L_i(t)}\right] + \mathbb{E}\left[\sum_{t=\overline{\tau}_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]\right\} \\
&= \frac{1}{\mathbb{E}\left[\tau_i(m+1)-\tau_i(m)\right]}\left\{z\frac{F_i(z)-1}{z-P_i(z)} + \frac{1-F_i(z)}{1-P_i(z)}\right\} \\
&= \frac{1}{\mathbb{E}\left[C_i\right]}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)}
\end{aligned}$$

es decir

$$Q_i(z) = \frac{1}{\mathbb{E}\left[C_i\right]}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)} \tag{37.2.286}$$

Si hacemos:

$$S(z) = 1-F(z) \tag{37.2.287}$$
$$T(z) = z-P(z) \tag{37.2.288}$$
$$U(z) = 1-P(z) \tag{37.2.289}$$

entonces

$$\mathbb{E}\left[C_i\right]Q(z) = \frac{(z-1)S(z)P(z)}{T(z)U(z)} \tag{37.2.290}$$

A saber, si $a_k = P\{L(t)=k\}$

$$S(z) = 1-F(z) = 1-\sum_{k=0}^{+\infty} a_k z^k$$

entonces
$S^{'}(z) = -\sum_{k=1}^{+\infty} k a_k z^{k-1}$, por tanto $S^{(1)}(1) = -\sum_{k=1}^{+\infty} k a_k = -\mathbb{E}\left[L(t)\right]$, luego $S^{''}(z) = -\sum_{k=2}^{+\infty} k(k-1)a_k z^{k-2}$ y $S^{(2)}(1) = -\sum_{k=2}^{+\infty} k(k-1)a_k = \mathbb{E}\left[L(L-1)\right]$; de la misma manera $S^{'''}(z) = -\sum_{k=3}^{+\infty} k(k-1)(k-2)a_k z^{k-3}$ y $S^{(3)}(1) = -\sum_{k=3}^{+\infty} k(k-1)(k-2)a_k = -\mathbb{E}\left[L(L-1)(L-2)\right] = -\mathbb{E}\left[L^3\right] + 3 - \mathbb{E}\left[L^2\right] - 2 - \mathbb{E}\left[L\right]$.
Es decir

$$\begin{aligned}
S^{(1)}(1) &= -\mathbb{E}\left[L(t)\right], \\
S^{(2)}(1) &= -\mathbb{E}\left[L(L-1)\right] = -\mathbb{E}\left[L^2\right] + \mathbb{E}\left[L\right], \\
S^{(3)}(1) &= -\mathbb{E}\left[L(L-1)(L-2)\right] = -\mathbb{E}\left[L^3\right] + 3\mathbb{E}\left[L^2\right] - 2\mathbb{E}\left[L\right].
\end{aligned}$$

Expandiendo alrededor de $z=1$

$$\begin{aligned}
S(z) &= S(1) + \frac{S^{'}(1)}{1!}(z-1) + \frac{S^{''}(1)}{2!}(z-1)^2 + \frac{S^{'''}(1)}{3!}(z-1)^3 + \ldots + \\
&= (z-1)\left\{S^{'}(1) + \frac{S^{''}(1)}{2!}(z-1) + \frac{S^{'''}(1)}{3!}(z-1)^2 + \ldots +\right\} \\
&= (z-1)R_1(z)
\end{aligned}$$

con $R_1(z) \neq 0$, pues

$$R_1(z) = -\mathbb{E}\left[L\right] \tag{37.2.291}$$

entonces

$$R_1(z) = S^{'}(1) + \frac{S^{''}(1)}{2!}(z-1) + \frac{S^{'''}(1)}{3!}(z-1)^2 + \frac{S^{iv}(1)}{4!}(z-1)^3 + \ldots + \tag{37.2.292}$$

Calculando las derivadas y evaluando en $z = 1$

$$R_1(1) = S^{(1)}(1) = -\mathbb{E}[L] \tag{37.2.293}$$

$$R_1^{(1)}(1) = \frac{1}{2}S^{(2)}(1) = -\frac{1}{2}\mathbb{E}\left[L^2\right] + \frac{1}{2}\mathbb{E}[L] \tag{37.2.294}$$

$$R_1^{(2)}(1) = \frac{2}{3!}S^{(3)}(1) = -\frac{1}{3}\mathbb{E}\left[L^3\right] + \mathbb{E}\left[L^2\right] - \frac{2}{3}\mathbb{E}[L] \tag{37.2.295}$$

De manera análoga se puede ver que para $T(z) = z - P(z)$ se puede encontrar una expanción alrededor de $z = 1$ Expandiendo alrededor de $z = 1$

$$\begin{aligned} T(z) &= T(1) + \frac{T^{'}(1)}{1!}(z-1) + \frac{T^{''}(1)}{2!}(z-1)^2 + \frac{T^{'''}(1)}{3!}(z-1)^3 + \ldots + \\ &= (z-1)\left\{T^{'}(1) + \frac{T^{''}(1)}{2!}(z-1) + \frac{T^{'''}(1)}{3!}(z-1)^2 + \ldots + \right\} \\ &= (z-1)R_2(z) \end{aligned}$$

donde

$$\begin{aligned} T^{(1)}(1) &= -\mathbb{E}[X(t)] = -\mu, \\ T^{(2)}(1) &= -\mathbb{E}[X(X-1)] = -\mathbb{E}\left[X^2\right] + \mathbb{E}[X] = -\mathbb{E}\left[X^2\right] + \mu, \\ T^{(3)}(1) &= -\mathbb{E}[X(X-1)(X-2)] = -\mathbb{E}\left[X^3\right] + 3\mathbb{E}\left[X^2\right] - 2\mathbb{E}[X] \\ &= -\mathbb{E}\left[X^3\right] + 3\mathbb{E}\left[X^2\right] - 2\mu. \end{aligned}$$

Por lo tanto $R_2(1) \neq 0$, pues

$$R_2(1) = 1 - \mathbb{E}[X] = 1 - \mu \tag{37.2.296}$$

entonces

$$R_2(z) = T^{'}(1) + \frac{T^{''}(1)}{2!}(z-1) + \frac{T^{'''}(1)}{3!}(z-1)^2 + \frac{T^{(iv)}(1)}{4!}(z-1)^3 + \ldots + \tag{37.2.297}$$

Calculando las derivadas y evaluando en $z = 1$

$$R_2(1) = T^{(1)}(1) = 1 - \mu \tag{37.2.298}$$

$$R_2^{(1)}(1) = \frac{1}{2}T^{(2)}(1) = -\frac{1}{2}\mathbb{E}\left[X^2\right] + \frac{1}{2}\mu \tag{37.2.299}$$

$$R_2^{(2)}(1) = \frac{2}{3!}T^{(3)}(1) = -\frac{1}{3}\mathbb{E}\left[X^3\right] + \mathbb{E}\left[X^2\right] - \frac{2}{3}\mu \tag{37.2.300}$$

Finalmente para de manera análoga se puede ver que para $U(z) = 1 - P(z)$ se puede encontrar una expanción alrededor de $z = 1$

$$\begin{aligned} U(z) &= U(1) + \frac{U^{'}(1)}{1!}(z-1) + \frac{U^{''}(1)}{2!}(z-1)^2 + \frac{U^{'''}(1)}{3!}(z-1)^3 + \ldots + \\ &= (z-1)\left\{U^{'}(1) + \frac{U^{''}(1)}{2!}(z-1) + \frac{U^{'''}(1)}{3!}(z-1)^2 + \ldots + \right\} \\ &= (z-1)R_3(z) \end{aligned}$$

donde

$$\begin{aligned} U^{(1)}(1) &= -\mathbb{E}[X(t)] = -\mu, \\ U^{(2)}(1) &= -\mathbb{E}[X(X-1)] = -\mathbb{E}\left[X^2\right] + \mathbb{E}[X] = -\mathbb{E}\left[X^2\right] + \mu, \\ U^{(3)}(1) &= -\mathbb{E}[X(X-1)(X-2)] = -\mathbb{E}\left[X^3\right] + 3\mathbb{E}\left[X^2\right] - 2\mathbb{E}[X] \\ &= -\mathbb{E}\left[X^3\right] + 3\mathbb{E}\left[X^2\right] - 2\mu. \end{aligned}$$

Por lo tanto $R_3(1) \neq 0$, pues

$$R_3(1) = -\mathbb{E}[X] = -\mu \tag{37.2.301}$$

entonces

$$R_3(z) = U'(1) + \frac{U''(1)}{2!}(z-1) + \frac{U'''(1)}{3!}(z-1)^2 + \frac{U^{(iv)}(1)}{4!}(z-1)^3 + \ldots + \tag{37.2.302}$$

Calculando las derivadas y evaluando en $z = 1$

$$R_3(1) = U^{(1)}(1) = -\mu \tag{37.2.303}$$

$$R_3^{(1)}(1) = \frac{1}{2}U^{(2)}(1) = -\frac{1}{2}\mathbb{E}\left[X^2\right] + \frac{1}{2}\mu \tag{37.2.304}$$

$$R_3^{(2)}(1) = \frac{2}{3!}U^{(3)}(1) = -\frac{1}{3}\mathbb{E}\left[X^3\right] + \mathbb{E}\left[X^2\right] - \frac{2}{3}\mu \tag{37.2.305}$$

Por lo tanto

$$\mathbb{E}[C_i]\,Q(z) = \frac{(z-1)(z-1)R_1(z)P(z)}{(z-1)R_2(z)(z-1)R_3(z)} = \frac{R_1(z)P(z)}{R_2(z)R_3(z)} \equiv \frac{R_1P}{R_2R_3} \tag{37.2.306}$$

Entonces

$$\left[\frac{R_1(z)P(z)}{R_2(z)R_3(z)}\right]' = \frac{PR_2R_3R_1' + R_1R_2R_3P' - R_3R_1PR_2 - R_2R_1PR_3'}{(R_2R_3)^2} \tag{37.2.307}$$

Evaluando en $z = 1$

$$\begin{aligned}
&= \frac{R_2(1)R_3(1)R_1^{(1)}(1) + R_1(1)R_2(1)R_3(1)P'(1) - R_3(1)R_1(1)R_2(1)^{(1)} - R_2(1)R_1(1)R_3'(1)}{(R_2(1)R_3(1))^2} \\
&= \frac{1}{(1-\mu)^2\mu^2}\left\{\left(-\frac{1}{2}\mathbb{E}L^2 + \frac{1}{2}\mathbb{E}L\right)(1-\mu)(-\mu) + (-\mathbb{E}L)(1-\mu)(-\mu)\mu\right. \\
&\quad \left. -\left(-\frac{1}{2}\mathbb{E}X^2 + \frac{1}{2}\mu\right)(-\mu)(-\mathbb{E}L) - (1-\mu)(-\mathbb{E}L)\left(-\frac{1}{2}\mathbb{E}X^2 + \frac{1}{2}\mu\right)\right\} \\
&= \frac{1}{(1-\mu)^2\mu^2}\left\{\left(-\frac{1}{2}\mathbb{E}L^2 + \frac{1}{2}\mathbb{E}L\right)\left(\mu^2 - \mu\right) + \left(\mu^2 - \mu^3\right)\mathbb{E}L\right. \\
&\quad \left. -\mu\mathbb{E}L\left(-\frac{1}{2}\mathbb{E}X^2 + \frac{1}{2}\mu\right) + (\mathbb{E}L - \mu\mathbb{E}L)\left(-\frac{1}{2}\mathbb{E}X^2 + \frac{1}{2}\mu\right)\right\} \\
&= \frac{1}{(1-\mu)^2\mu^2}\left\{-\frac{1}{2}\mu^2\mathbb{E}L^2 + \frac{1}{2}\mu\mathbb{E}L^2 + \frac{1}{2}\mu^2\mathbb{E}L - \mu^3\mathbb{E}L + \mu\mathbb{E}L\mathbb{E}X^2 - \frac{1}{2}\mathbb{E}L\mathbb{E}X^2\right\} \\
&= \frac{1}{(1-\mu)^2\mu^2}\left\{\frac{1}{2}\mu\mathbb{E}L^2(1-\mu) + \mathbb{E}L\left(\frac{1}{2} - \mu\right)\left(\mu^2 - \mathbb{E}X^2\right)\right\} \\
&= \frac{1}{2\mu(1-\mu)}\mathbb{E}L^2 - \frac{\frac{1}{2} - \mu}{(1-\mu)^2\mu^2}\sigma^2\mathbb{E}L
\end{aligned}$$

por lo tanto (para Takagi)

$$Q^{(1)} = \frac{1}{\mathbb{E}C}\left\{\frac{1}{2\mu(1-\mu)}\mathbb{E}L^2 - \frac{\frac{1}{2} - \mu}{(1-\mu)^2\mu^2}\sigma^2\mathbb{E}L\right\}$$

donde

$$\mathbb{E}C = \frac{\mathbb{E}L}{\mu(1-\mu)}$$

entonces

$$\begin{aligned}
Q^{(1)} &= \frac{1}{2}\frac{\mathbb{E}L^2}{\mathbb{E}L} - \frac{\frac{1}{2} - \mu}{(1-\mu)\mu}\sigma^2 = \frac{\mathbb{E}L^2}{2\mathbb{E}L} - \frac{\sigma^2}{2}\left\{\frac{2\mu - 1}{(1-\mu)\mu}\right\} \\
&= \frac{\mathbb{E}L^2}{2\mathbb{E}L} + \frac{\sigma^2}{2}\left\{\frac{1}{1-\mu} + \frac{1}{\mu}\right\}
\end{aligned}$$

Mientras que para nosotros

$$Q^{(1)} = \frac{1}{\mu(1-\mu)}\frac{\mathbb{E}L^2}{2\mathbb{E}C} - \sigma^2\frac{\mathbb{E}L}{2\mathbb{E}C}\cdot\frac{1-2\mu}{(1-\mu)^2\mu^2}$$

Retomando la ecuación (37.2.307)

$$\left[\frac{R_1(z)P(z)}{R_2(z)R_3(z)}\right]' = \frac{PR_2R_3R_1' + R_1R_2R_3P' - R_3R_1PR_2 - R_2R_1PR_3'}{(R_2R_3)^2} = \frac{F(z)}{G(z)}$$

donde

$$\begin{aligned} F(z) &= PR_2R_3R_1' + R_1R_2R_3P' - R_3R_1PR_2' - R_2R_1PR_3' \\ G(z) &= R_2^2R_3^2 \\ G^2(z) &= R_2^4R_3^4 = (1-\mu)^4\mu^4 \end{aligned}$$

y por tanto

$$\begin{aligned} G'(z) &= 2R_2R_3\left[R_2'R_3 + R_2R_3'\right] \\ G'(1) &= -2(1-\mu)\mu\left[\left(-\frac{1}{2}\mathbb{E}\left[X^2\right] + \frac{1}{2}\mu\right)(-\mu) + (1-\mu)\left(-\frac{1}{2}\mathbb{E}\left[X^2\right] + \frac{1}{2}\mu\right)\right] \end{aligned}$$

$$F'(z) = \left[(R_2R_3)R_1'' - (R_1R_3)R_2'' - (R_1R_2)R_3'' - 2\left(R_2'R_3'\right)R_1\right]P + 2(R_2R_3)R_1'P' + (R_1R_2R_3)P''$$

Por lo tanto, encontremos $F'(z)G(z) + F(z)G'(z)$:

$$\begin{aligned} F'(z)G(z) + F(z)G'(z) = &\left\{\left[(R_2R_3)R_1'' - (R_1R_3)R_2'' - (R_1R_2)R_3'' - 2\left(R_2'R_3'\right)R_1\right]P\right. \\ &\left.+2(R_2R_3)R_1'P' + (R_1R_2R_3)P''\right\}R_2^2R_3^2 - \left\{\left[PR_2R_3R_1' + R_1R_2R_3P' - R_3R_1PR_2'\right.\right. \\ &\left.\left.-R_2R_1PR_3'\right]\left[2R_2R_3\left(R_2'R_3 + R_2R_3'\right)\right]\right\} \end{aligned}$$

Evaluando en $z = 1$

$$\begin{aligned} &= (1+R_3)^3R_3^3R_1'' - (1+R_3)^2R_1R_3^3R_3'' - (1+R_3)^3R_3^2R_1R_3'' - 2(1+R_3)^2R_3^2\left(R_3'\right)^2 \\ &+ 2(1+R_3)^3R_3^3R_1'P' + (1+R_3)^3R_3^3R_1P'' - 2(1+R_3)^2R_3^2(1+2R_3)R_3'R_1' \\ &- 2(1+R_3)^2R_3^2R_1R_3'(1+2R_3)P' + 2(1+R_3)(1+2R_3)R_3^3R_1\left(R_3'\right)^2 \\ &+ 2(1+R_3)^2(1+2R_3)R_1R_3R_3' \\ &= -(1-\mu)^3\mu^3R_1'' - (1-\mu)^2\mu^2R_1(1-2\mu)R_3'' - (1-\mu)^3\mu^3R_1P'' \\ &+ 2(1-\mu)\mu^2\left[(1-2\mu)R_1 - (1-\mu)\right]\left(R_3'\right)^2 - 2(1-\mu)^2\mu R_1(1-2\mu)R_3' \\ &- 2(1-\mu)^3\mu^4R_1' - 2\mu(1-\mu)(1-2\mu)R_3'R_1' - 2\mu^3(1-\mu)^2(1-2\mu)R_1R_1' \end{aligned}$$

por tanto

$$\begin{aligned} \left[\frac{F(z)}{G(z)}\right]' = &\frac{1}{\mu^3(1-\mu)^3}\left\{-(1-\mu)^2\mu^2R_1'' - \mu(1-\mu)(1-2\mu)R_1R_3'' - \mu^2(1-\mu)^2R_1P''\right. \\ &+2\mu\left[(1-2\mu)R_1 - (1-\mu)\right]\left(R_3'\right)^2 - 2(1-\mu)(1-2\mu)R_1R_3' - 2\mu^3(1-\mu)^2R_1' \\ &\left.-2(1-2\mu)R_3'R_1' - 2\mu^2(1-\mu)(1-2\mu)R_1R_1'\right\} \end{aligned}$$

recordemos que

$$
\begin{aligned}
R_1 &= -\mathbb{E}L \\
R_3 &= -\mu \\
R_1^{'} &= -\frac{1}{2}\mathbb{E}L^2 + \frac{1}{2}\mathbb{E}L \\
R_3^{'} &= -\frac{1}{2}\mathbb{E}X^2 + \frac{1}{2}\mu \\
R_1^{''} &= -\frac{1}{3}\mathbb{E}L^3 + \mathbb{E}L^2 - \frac{2}{3}\mathbb{E}L \\
R_3^{''} &= -\frac{1}{3}\mathbb{E}X^3 + \mathbb{E}X^2 - \frac{2}{3}\mu \\
R_1 R_3^{'} &= \frac{1}{2}\mathbb{E}X^2\mathbb{E}L - \frac{1}{2}\mathbb{E}X\mathbb{E}L \\
R_1 R_1^{'} &= \frac{1}{2}\mathbb{E}L^2\mathbb{E}L + \frac{1}{2}\mathbb{E}^2 L \\
R_3^{'} R_1^{'} &= \frac{1}{4}\mathbb{E}X^2\mathbb{E}L^2 - \frac{1}{4}\mathbb{E}X^2\mathbb{E}L - \frac{1}{4}\mathbb{E}L^2\mathbb{E}X + \frac{1}{4}\mathbb{E}X\mathbb{E}L \\
R_1 R_3^{''} &= \frac{1}{6}\mathbb{E}X^3\mathbb{E}L^2 - \frac{1}{6}\mathbb{E}X^3\mathbb{E}L - \frac{1}{2}\mathbb{E}L^2\mathbb{E}X^2 + \frac{1}{2}\mathbb{E}X^2\mathbb{E}L + \frac{1}{3}\mathbb{E}X\mathbb{E}L^2 - \frac{1}{3}\mathbb{E}X\mathbb{E}L \\
R_1 P^{''} &= -\mathbb{E}X^2\mathbb{E}L \\
\left(R_3^{'}\right)^2 &= \frac{1}{4}\mathbb{E}^2X^2 - \frac{1}{2}\mathbb{E}X^2\mathbb{E}X + \frac{1}{4}\mathbb{E}^2X
\end{aligned}
$$

Definición 37.2.269 *Let L_i^* be the number of users at queue Q_i when it is polled, then*

$$\mathbb{E}\left[L_i^*\right] = f_i(i), \quad Var\left[L_i^*\right] = f_i(i,i) + \mathbb{E}\left[L_i^*\right] - \mathbb{E}\left[L_i^*\right]^2. \tag{37.2.308}$$

Definición 37.2.270 *The cycle time C_i for the queue Q_i is the period beginning at the time when it is polled in a cycle and ending at the time when it is polled in the next cycle; it's duration is given by $\tau_i(m+1) - \tau_i(m)$, equivalently $\overline{\tau}_i(m+1) - \overline{\tau}_i(m)$ under steady state assumption.*

Definición 37.2.271 *The intervisit time I_i is defined as the period beginning at the time of its service completion in a cycle and ending at the time when it is polled in the next cycle; its duration is given by $\tau_i(m+1) - \overline{\tau}_i(m)$.*

The intervisit time duration $\tau_i(m+1) - \overline{\tau}(m)$ given the number of users found at queue Q_i at time $t = \tau_i(m+1)$ is equal to the number of arrivals during the preceding intervisit time $[\overline{\tau}(m), \tau_i(m+1)]$.

So we have

$$\mathbb{E}\left[z_i^{L_i(\tau_i(m+1))}\right] = \mathbb{E}\left[\{P_i(z_i)\}^{\tau_i(m+1)-\overline{\tau}(m)}\right]$$

if $I_i(z) = \mathbb{E}\left[z^{\tau_i(m+1)-\overline{\tau}(m)}\right]$ we have $F_i(z) = I_i[P_i(z)]$ for $i = 1, 2$. Futhermore can be proved that

$$
\begin{aligned}
&\mathbb{E}[L_i] = \mu_i\mathbb{E}[I_i], && \mathbb{E}[C_i] = \tfrac{f_i(i)}{\mu_i(1-\mu_i)}, \\
&\mathbb{E}[S_i] = \mu_i\mathbb{E}[C_i], && \mathbb{E}[I_i] = (1-\mu_i)\,\mathbb{E}[C_i], \\
&Var[L_i] = \mu_i^2 Var[I_i] + \sigma^2\mathbb{E}[I_i], && Var[C_i] = \tfrac{Var[L_i^*]}{\mu_i^2(1-\mu_i)^2}, \\
&Var[S_i] = \tfrac{Var[L_i^*]}{(1-\mu_i)^2} + \tfrac{\sigma^2\mathbb{E}[L_i^*]}{(1-\mu_i)^3}, && Var[I_i] = \tfrac{Var[L_i^*]}{\mu_i^2} - \tfrac{\sigma_i^2}{\mu_i^2} f_i(i).
\end{aligned} \tag{37.2.309}
$$

Let consider the points when the process $[L_1(1), L_2(1), L_3(1), L_4(1)]$ becomes zero at the same time, this points, $T_1, T_2, \ldots$ will be denoted as regeneration points, then we have that

Definición 37.2.272 *the interval between two such succesive regeneration points will be called regenerative cycle.*

Definición 37.2.273 *Para T_i se define, M_i, el número de ciclos de visita a la cola Q_l, durante el ciclo regenerativo, es decir, M_i es un proceso de renovación.*

Definición 37.2.274 *Para cada uno de los M_i's, se definen a su vez la duración de cada uno de estos ciclos de visita en el ciclo regenerativo, $C_i^{(m)}$, para $m = 1, 2, \ldots, M_i$, que a su vez, también es n proceso de renovación.*

Sea la función generadora de momentos para L_i, el número de usuarios en la cola $Q_i(z)$ en cualquier momento, está dada por el tiempo promedio de $z^{L_i(t)}$ sobre el ciclo regenerativo definido anteriormente. Entonces

$$Q_i(z) = \frac{1}{\mathbb{E}[C_i]} \cdot \frac{1 - F_i(z)}{P_i(z) - z} \cdot \frac{(1-z) P_i(z)}{1 - P_i(z)}. \tag{37.2.310}$$

Es decir, es posible determinar las longitudes de las colas a cualquier tiempo t. Entonces, determinando el primer momento es posible ver que

M_i is an stopping time for the regenerative process with $\mathbb{E}[M_i] < \infty$, from Wald's lemma follows that:

$$\begin{aligned}
\mathbb{E}\left[\sum_{m=1}^{M_i} \sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}[M_i]\, \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] \\
\mathbb{E}\left[\sum_{m=1}^{M_i} \tau_i(m+1) - \tau_i(m)\right] &= \mathbb{E}[M_i]\, \mathbb{E}[\tau_i(m+1) - \tau_i(m)]
\end{aligned}$$

therefore

$$Q_i(z) = \frac{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}[\tau_i(m+1) - \tau_i(m)]}$$

Doing the following substitutions en (**??**): $n \to t - \tau_i(m)$, $T \to \overline{\tau}_i(m) - \tau_i(m)$, $L_n \to L_i(t)$ and $F(z) = \mathbb{E}\left[z^{L_0}\right] \to F_i(z) = \mathbb{E}\left[z^{L_i \tau_i(m)}\right]$, we obtain

$$\mathbb{E}\left[\sum_{n=0}^{T-1} z^{L_n}\right] = \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\overline{\tau}_i(m)-1} z^{L_i(t)}\right] = z\frac{F_i(z) - 1}{z - P_i(z)} \tag{37.2.311}$$

Por otra parte durante el tiempo de intervisita para la cola i, $L_i(t)$ solamente se incrementa de manera que el incremento por intervalo de tiempo está dado por la función generadora de probabilidades de $P_i(z)$, por tanto la suma sobre el tiempo de intervisita puede evaluarse como:

$$\begin{aligned}
\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} \{P_i(z)\}^{t-\overline{\tau}_i(m)}\right] = \frac{1 - \mathbb{E}\left[\{P_i(z)\}^{\tau_i(m+1)-\overline{\tau}_i(m)}\right]}{1 - P_i(z)} \\
&= \frac{1 - I_i[P_i(z)]}{1 - P_i(z)}
\end{aligned}$$

por tanto

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = \frac{1 - F_i(z)}{1 - P_i(z)}$$

Por lo tanto

$$\begin{aligned}
Q_i(z) &= \frac{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}[\tau_i(m+1) - \tau_i(m)]} = \frac{1}{\mathbb{E}[\tau_i(m+1) - \tau_i(m)]} \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] \\
&= \frac{1}{\mathbb{E}[\tau_i(m+1) - \tau_i(m)]} \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\overline{\tau}_i(m)-1} z^{L_i(t)} + \sum_{t=\overline{\tau}_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] \\
&= \frac{1}{\mathbb{E}[\tau_i(m+1) - \tau_i(m)]} \left\{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\overline{\tau}_i(m)-1} z^{L_i(t)}\right] + \mathbb{E}\left[\sum_{t=\overline{\tau}_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]\right\} \\
&= \frac{1}{\mathbb{E}[\tau_i(m+1) - \tau_i(m)]} \left\{z\frac{F_i(z) - 1}{z - P_i(z)} + \frac{1 - F_i(z)}{1 - P_i(z)}\right\} \\
&= \frac{1}{\mathbb{E}[C_i]} \cdot \frac{1 - F_i(z)}{P_i(z) - z} \cdot \frac{(1-z) P_i(z)}{1 - P_i(z)}
\end{aligned}$$

es decir

$$\begin{array}{ll} S^{'}(z) = -\sum_{k=1}^{+\infty} k a_k z^{k-1}, & S^{(1)}(1) = -\sum_{k=1}^{+\infty} k a_k = -\mathbb{E}\left[L(t)\right], \\ S^{''}(z) = -\sum_{k=2}^{+\infty} k(k-1) a_k z^{k-2}, & S^{(2)}(1) = -\sum_{k=2}^{+\infty} k(k-1) a_k = \mathbb{E}\left[L(L-1)\right], \\ S^{'''}(z) = -\sum_{k=3}^{+\infty} k(k-1)(k-2) a_k z^{k-3}, & S^{(3)}(1) = -\sum_{k=3}^{+\infty} k(k-1)(k-2) a_k \\ & = -\mathbb{E}\left[L(L-1)(L-2)\right] \\ & = -\mathbb{E}\left[L^3\right] + 3 - \mathbb{E}\left[L^2\right] - 2 - \mathbb{E}\left[L\right]; \end{array} \tag{37.2.312}$$

37.3. Introduction

A cyclic polling system consists of multiple queues that are served by a single server in cyclic order. Users arrive at each queue according to independent processes, which also are independent of the service times. The server attends each queue according to a service policy previously established. The most commonly service policies studied are the exhaustive, gated and the k-limited. The exhaustive policy consists in attending all users until the queue is emptied. When the server finishes, it moves to the next queue incurring in a switchover time that is an independent and identically distributed random variable. An exhaustive analysis have been made in this subject. For an overview of the literature on polling systems, their applications and standard results we refer to surveys such as: [3, 22, 25, 34, 43, 42].

Bos and Boon [5] published a report where they studied a Network of Polling Systems applied to a traffic problem, there they analyzed a network of intersections and followed a path in it. Their objective was to predict if the costumers can pass through the network in a finite time or not. The buffer occupancy method was used in this analysis and simulation techniques were also used to verify the results. It is important to remark that the heavy traffic case was studied in this report, as well as the cyclic case was not considered.

In this work, we study a Network of Cyclic Polling Systems (NCPS) that consists of two cyclic polling systems, each of them conformed by two queues attended by a single server. We apply the buffer occupancy method described by Kleinrock and Takagi [43]. This method is based on the use of the Probability Generating Function (PGF) of the joint distribution function of the queues lengths at the moment the server starts a visit period in each of the queues that conform the system.

We present a theorem that guarantees the stability for the NCPS under specific conditions, also we obtain explicit expressions for the queue lengths at the moment the server arrives. With this results we obtain the queue lengths of the NCPS at any time for the servers.

We believe these results can be generalized for the continuous case and from the point of view of applications, the results are useful because they allow us to obtain analytical expressions for the performance measures, and also give us the keys to determine waiting times and queue lengths for any time during the operation of the network. Initially our main goal was studying the system of public transportation, which can be seen as a network consisting of several cyclic polling systems.

37.4. Construcción del Modelo e Hipótesis

Consider a Network consisting of two cyclic polling systems with two queues each, Q_1, Q_2 for the first system and $\hat{Q}_1, \hat{Q}_2$ for the second one, each of them with infinite-sized buffer. In each system a single server visits the queues in cyclic order, where it applies the exhaustive policy, i.e., when the server polls a queue, it serves all the customers present until the queue becomes empty. This case is illustrated in `Figure 1`.

The second system's users at queue 2, can moves to the first system after being attended, also we assume that the network is open; that is, all customers eventually leave the network. As usually in polling systems theory we assume the arrivals in each queue are Poisson processes from with independent identical distributed (i.i.d.) inter arrival exponential times. The service times are exponential independent and identically distributed random variables. Finally upon completion of a visit at any queue, the servers incurs in a random switchover time according to an arbitrary distribution. We define a cycle to be the time interval between two consecutive polling instants, the time period in a cycle during which the server is attending a queue is called a service period. We are considering the case where the server visit the queues in cyclic order.

Time is slotted with slot size equal to the service time of a fixed costumer, we call the time interval $[t, t+1]$ the t-th slot. The arrival processes are denoted by $X_1(t), X_2(t)$ for the first system and $\hat{X}_1(t)$, $\hat{X}_2(t)$ for the second, the arrival rate at Q_i and $\hat{Q}_i$ is denoted by μ_i and $\hat{\mu}_i$ respectively, with the condition $\mu_i < 1$ and $\hat{\mu}_i < 1$. The second system's users pass to the first one according to a process Y_2, with arrival rate $\tilde{\mu}_2$.

Let's denote by τ_i the polling instant at queue Q_1 and by $\overline{\tau}_i$ the instant when the servers leaves to queue and starts a switchover time. Like the rest of the random variables the swithcover period is an i.i.d random variable R_i with general distribution.

To determine the length of the queues, i.e., the number of users in the queue at the moment the server arrives we define the process L_i and $\hat{L}_i$ for the first and second system, respectively, in the sequel we use the buffer occupancy method to obtain the generating function, first and second moments of queue size distributions at polling instants. At each of the queues in the network the number of users is the number of users at the time the server arrives plus the numbers of users from the other system.

In order to obtain the joint probability generating function (PGF) for the number or users residing in queue i when the queue is polled in the NCPS, we define for each of the arrival processes $X_1, X_2, \hat{X}_1, \hat{X}_2, Y_2$, and $\tilde{X}_2$ with $\tilde{X}_2 = X_2 + Y_2$, their PGF

$$P_i(z_i) = \mathbb{E}\left[z_i^{X_i(t)}\right], \quad \hat{P}_i(w_i) = \mathbb{E}\left[w_i^{\hat{X}_i(t)}\right]$$

for $i = 1, 2$, and

$$\check{P}_2(z_2) = \mathbb{E}\left[z_2^{Y_2(t)}\right], \quad \tilde{P}_2(z_2) = \mathbb{E}\left[z_2^{\tilde{X}_2(t)}\right],$$

for $i = 1, 2$, and

$$\check{\mu}_2 = \mathbb{E}[Y_2(t)] = \check{P}_2^{(1)}(1), \quad \tilde{\mu}_2 = \mathbb{E}\left[\tilde{X}_2(t)\right] = \tilde{P}_2^{(1)}(1).$$

The PGF For the service time is defined by:

$$S_i(z_i) = \mathbb{E}\left[z_i^{\overline{\tau}_i - \tau_i}\right], \quad \hat{S}_i(w_i) = \mathbb{E}\left[w_i^{\overline{\zeta}_i - \zeta_i}\right]$$

with first moment

$$s_i = \mathbb{E}[\overline{\tau}_i - \tau_i], \quad \hat{s}_i = \mathbb{E}\left[\overline{\zeta}_i - \zeta_i\right]$$

for $i = 1, 2$. In a similar manner the PGF for the switchover time of the server from the moment it ends to attend a queue, to the time of arrival to the next queue is given by

$$R_i(z_i) = \mathbb{E}\left[z_1^{\tau_{i+1} - \overline{\tau}_i}\right], \quad \hat{R}_i(w_i) = \mathbb{E}\left[w_i^{\zeta_{i+1} - \overline{\zeta}_i}\right]$$

with first moment

$$r_i = \mathbb{E}[\tau_{i+1} - \overline{\tau}_i], \quad \hat{r}_i = \mathbb{E}\left[\zeta_{i+1} - \overline{\zeta}_i\right]$$

for $i = 1, 2$. The number of users in the queue at times $\overline{\tau}_1, \overline{\tau}_2, \overline{\zeta}_1, \overline{\zeta}_2$, it's zero, i.e., $L_i(\overline{\tau_i}) = 0$, and $\hat{L}_i\left(\overline{\zeta_i}\right) = 0$ for $i = 1, 2$. Then the number of users in the queue of the second system at the moment the server ends attending in the queue is given by the number of users present at the moment it arrives plus the number of arrivals during the service time, i.e.,

$$\hat{L}_i(\overline{\tau}_j) = \hat{L}_i(\tau_j) + \hat{X}_i(\overline{\tau}_j - \tau_j),$$

for $i, j = 1, 2$, meanwhile for the first system :

$$L_1(\overline{\tau}_j) = L_1(\tau_j) + X_1(\overline{\tau}_j - \tau_j).$$

Specifically for the second queue of the first system we need to consider the users of transfer becoming from the second queue in the second system while the server its in the other queue attending, it means that this users have been already attended by the server before they can go to the first queue:

$$L_2(\overline{\tau}_1) = L_2(\tau_1) + X_2(\overline{\tau}_1 - \tau_1) + Y_2(\overline{\tau}_1 - \tau_1). \tag{37.4.1}$$

As is know, the gambler's ruin problem can be used to model the server's busy period in a cyclic polling system, so let $\tilde{L}_0 \geq 0$ be the number of users present at the moment the server arrive to start attending, also let T be the time the server need to attend the users in the queue starting with $\tilde{L}_0$ users. Suppose the gambler has two independent and simultaneous moves, such events are independent and identical to each other for each realization. The gain on the n-th game is $\tilde{\mathsf{X}}_n = \mathsf{X}_n + \mathsf{Y}_n$ units from which is substracted a playing fee of 1 unit for each move. His PGF is given by $F(z) = \mathbb{E}\left[z^{\tilde{L}_0}\right]$, futhermore

$$\tilde{P}(z) = \mathbb{E}\left[z^{\tilde{\mathsf{X}}_n}\right] = \mathbb{E}\left[z^{\mathsf{X}_n + \mathsf{X}_n}\right] = \mathbb{E}\left[z^{\mathsf{X}_n} z^{\mathsf{X}_n}\right] = \mathbb{E}\left[z^{\mathsf{X}_n}\right]\mathbb{E}\left[z^{\mathsf{X}_n}\right] = P(z)\check{P}(z),$$

with $\tilde{\mu} = \mathbb{E}\left[\tilde{\mathsf{X}}_n\right] = \tilde{P}[z] < 1$. If $\tilde{L}_n$ denotes the capital remaining after the n-th game, then $\tilde{L}_n = \tilde{L}_0 + \tilde{\mathsf{X}}_1 + \tilde{\mathsf{X}}_2 + \cdots + \tilde{\mathsf{X}}_n - 2n$. The result that relates the gambler's ruin problem with the busy period of the server it's a generalization of the result given in Takagi [42] chapter 3.

Proposición 37.4.1 *Let's $G_n(z)$ and $G(z, w)$ defined as in (36.81.5), then $G_n(z) = \frac{1}{z}\left[G_{n-1}(z) - G_{n-1}(0)\right]\tilde{P}(z)$. Futhermore $G(z, w) = \frac{zF(z) - wP(z)G(0,w)}{z - wR(z)}$, with a unique pole in the unit circle, also the pole is of the form $z = \theta(w)$ and satisfies 3*

i) $\tilde{\theta}(1) = 1$,

ii) $\tilde{\theta}^{(1)}(1) = \frac{1}{1-\tilde{\mu}}$,

iii) $\tilde{\theta}^{(2)}(1) = \frac{\tilde{\mu}}{(1-\tilde{\mu})^2} + \frac{\tilde{\sigma}}{(1-\tilde{\mu})^3}$.

37.4.1. Description of the model: Probability Generating Function

In order to model the network of cyclic polling system it's necessary to consider the users arrivals to each queue in one of the system, but on times the other system's server arrival, ζ_i. In the case of the first system and the server arrives to a queue in the second one:

$$F_{i,j}\left(z_i;\zeta_j\right)=\mathbb{E}\left[z_i^{L_i(\zeta_j)}\right]=\sum_{k=0}^{\infty}\mathbb{P}\left[L_i\left(\zeta_j\right)=k\right]z_i^k,$$

for $i,j=1,2$. Now consider the case of the queues in the second system and the server arrive to a queue in the first system

$$\hat{F}_{i,j}\left(w_i;\tau_j\right)=\mathbb{E}\left[w_i^{\hat{L}_i(\tau_j)}\right]=\sum_{k=0}^{\infty}\mathbb{P}\left[\hat{L}_i\left(\tau_j\right)=k\right]w_i^k,$$

for $i,j=1,2$. With the developed we can define the joint PGF for the second system:

$$\mathbb{E}\left[w_1^{\hat{L}_1(\tau_j)}w_2^{\hat{L}_2(\tau_j)}\right]=\mathbb{E}\left[w_1^{\hat{L}_1(\tau_j)}\right]\mathbb{E}\left[w_2^{\hat{L}_2(\tau_j)}\right]=\hat{F}_{1,j}\left(w_1;\tau_j\right)\hat{F}_{2,j}\left(w_2;\tau_j\right)\equiv\hat{\mathbf{F}}_j\left(w_1,w_2;\tau_j\right).$$

In a similar manner we define the joint PGF for the first system, and the second system's server:

$$\mathbb{E}\left[z_1^{L_1(\zeta_j)}z_2^{L_2(\zeta_j)}\right]=\mathbb{E}\left[z_1^{L_1(\zeta_j)}\right]\mathbb{E}\left[z_2^{L_2(\zeta_j)}\right]=F_{1,j}\left(z_1;\zeta_j\right)F_{2,j}\left(z_2;\zeta_j\right)\equiv\mathbf{F}_j\left(z_1,z_2;\zeta_j\right).$$

Now we proceed to determine the joint PGF for the times that the server visit each queue in their corresponding system, i.e., $t=\{\tau_1,\tau_2,\zeta_1,\zeta_2\}$:

$$\begin{aligned}\mathbf{F}_j\left(z_1,z_2,w_1,w_2\right)&=\mathbb{E}\left[\prod_{i=1}^2 z_i^{L_i(\tau_j)}\prod_{i=1}^2 w_i^{\hat{L}_i(\tau_j)}\right],\\ \hat{\mathbf{F}}_j\left(z_1,z_2,w_1,w_2\right)&=\mathbb{E}\left[\prod_{i=1}^2 z_i^{L_i(\zeta_j)}\prod_{i=1}^2 w_i^{\hat{L}_i(\zeta_j)}\right],\end{aligned}\tag{37.4.2}$$

for $j=1,2$. Then with the purpose of find the number of users present in the netwotk when the server ends attending one of the queues in any of the systems we have that

$$\begin{aligned}&\mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)}z_2^{L_2(\overline{\tau}_1)}w_1^{\hat{L}_1(\overline{\tau}_1)}w_2^{\hat{L}_2(\overline{\tau}_1)}\right]=\mathbb{E}\left[z_2^{L_2(\overline{\tau}_1)}w_1^{\hat{L}_1(\overline{\tau}_1)}w_2^{\hat{L}_2(\overline{\tau}_1)}\right]\\ =\;&\mathbb{E}\left[z_2^{L_2(\tau_1)+X_2(\overline{\tau}_1-\tau_1)+Y_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{L}_1(\tau_1)+\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{L}_2(\tau_1)+\hat{X}_2(\overline{\tau}_1-\tau_1)}\right]\end{aligned}$$

using the equation (37.4.1) we have

$$\begin{aligned}=\;&\mathbb{E}\left[z_2^{L_2(\tau_1)}z_2^{X_2(\overline{\tau}_1-\tau_1)}z_2^{Y_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{L}_1(\tau_1)}w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{L}_2(\tau_1)}w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right]\\ =\;&\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right\}\left\{z_2^{X_2(\overline{\tau}_1-\tau_1)}z_2^{Y_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right]\end{aligned}$$

applying the fact that the arrivals processes in the queues in each systems are independent:

$$=\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{z_2^{X_2(\overline{\tau}_1-\tau_1)}z_2^{Y_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]$$

given that the arrival processes in the queues are independent, it's possible to separate the expectation for the arrival processes in Q_1 and Q_2 at time τ_1, which is the time the server visits Q_1. Considering $\tilde{X}_2\left(z_2\right)=X_2\left(z_2\right)+Y_2\left(z_2\right)$ we have

$$\begin{aligned}&=\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{z_2^{\tilde{X}_2(\overline{\tau}_1-\tau_1)}w_1^{\hat{X}_1(\overline{\tau}_1-\tau_1)}w_2^{\hat{X}_2(\overline{\tau}_1-\tau_1)}\right\}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]\\ &=\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{\tilde{P}_2\left(z_2\right)^{\overline{\tau}_1-\tau_1}\hat{P}_1\left(w_1\right)^{\overline{\tau}_1-\tau_1}\hat{P}_2\left(w_2\right)^{\overline{\tau}_1-\tau_1}\right\}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]\\ &=\mathbb{E}\left[z_2^{L_2(\tau_1)}\left\{\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right\}^{\overline{\tau}_1-\tau_1}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]\\ &=\mathbb{E}\left[z_2^{L_2(\tau_1)}\theta_1\left(\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right)^{L_1(\tau_1)}\right]\mathbb{E}\left[w_1^{\hat{L}_1(\tau_1)}w_2^{\hat{L}_2(\tau_1)}\right]\\ &=F_1\left(\theta_1\left(\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),z_2\right)\cdot\hat{F}_1\left(w_1,w_2;\tau_1\right)\\ &\equiv\mathbf{F}_1\left(\theta_1\left(\tilde{P}_2\left(z_2\right)\hat{P}_1\left(w_1\right)\hat{P}_2\left(w_2\right)\right),z_2,w_1,w_2\right).\end{aligned}$$

The last equalities are true because the number of arrivals to $\hat{Q}_2$ during the time interval $[\tau_1,\overline{\tau}_1]$ still haven't been attended by the server in the system 2, then the users can't pass to the first system through the queue Q_2. Therefore

the number of users switching from $\hat{Q}_2$ to Q_2 during the time interval $[\tau_1, \overline{\tau}_1]$ depends on the policy of transfer between the two systems, according to the last section

$$\begin{aligned}&\mathbb{E}\left[z_1^{L_1(\overline{\tau}_1)} z_2^{L_2(\overline{\tau}_1)} w_1^{\hat{L}_1(\overline{\tau}_1)} w_2^{\hat{L}_2(\overline{\tau}_1)}\right] = \mathbf{F}_1\left(\theta_1\left(\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right), z_2, w_1, w_2\right)\\ &\equiv F_1\left(\theta_1\left(\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right), z_2\right)\hat{F}_1(w_1, w_2; \tau_1).\end{aligned}$$

Using similar reasoning for the rest of the server's arrival times we have that

$$\begin{aligned}\mathbb{E}\left[z_1^{L_1(\overline{\tau}_2)} z_2^{L_2(\overline{\tau}_2)} w_1^{\hat{L}_1(\overline{\tau}_2)} w_2^{\hat{L}_2(\overline{\tau}_2)}\right] &= F_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\hat{P}_1(w_1)\hat{P}_2(w_2)\right)\right)\hat{F}_2(w_1, w_2; \tau_2)\\ &\equiv \mathbf{F}_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\hat{P}_1(w_1)\hat{P}_2(w_2)\right), w_1, w_2\right),\\ \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_1)} z_2^{L_2(\overline{\zeta}_1)} w_1^{\hat{L}_1(\overline{\zeta}_1)} w_2^{\hat{L}_2(\overline{\zeta}_1)}\right] &= F_1(z_1, z_2; \zeta_1)\hat{F}_1\left(\hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right), w_2\right)\\ &\equiv \hat{\mathbf{F}}_1\left(z_1, z_2, \hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right), w_2\right),\\ \mathbb{E}\left[z_1^{L_1(\overline{\zeta}_2)} z_2^{L_2(\overline{\zeta}_2)} w_1^{\hat{L}_1(\overline{\zeta}_2)} w_2^{\hat{L}_2(\overline{\zeta}_2)}\right] &= F_2(z_1, z_2; \zeta_2)\hat{F}_2\left(w_1, \hat{\theta}_2\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\right)\right)\\ &\equiv \hat{\mathbf{F}}_2\left(z_1, z_2, w_1, \hat{\theta}_2\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\right)\right).\end{aligned}$$

Now we are in conditions to obtain the recursive equations that model the NCPS. We need to consider the switchover times that the server need to translate from one queue to another and, the number or user presents in the system at the time the server leaves to the queue to start attending the next. Thus far developed, we can find that for the NCPS:

$$\begin{aligned}\mathbf{F}_2(z_1, z_2, w_1, w_2) &= R_1\left(P_1(z_1)\tilde{P}_2(z_2)\textstyle\prod_{i=1}^2 \hat{P}_i(w_i)\right)\mathbf{F}_1\left(\theta_1\left(\tilde{P}_2(z_2)\hat{P}_1(w_1)\hat{P}_2(w_2)\right), z_2, w_1, w_2\right),\\ \mathbf{F}_1(z_1, z_2, w_1, w_2) &= R_2\left(P_1(z_1)\tilde{P}_2(z_2)\textstyle\prod_{i=1}^2 \hat{P}_i(w_i)\right)\mathbf{F}_2\left(z_1, \tilde{\theta}_2\left(P_1(z_1)\hat{P}_1(w_1)\hat{P}_2(w_2)\right), w_1, w_2\right),\\ \hat{\mathbf{F}}_2(z_1, z_2, w_1, w_2) &= \hat{R}_1\left(P_1(z_1)\tilde{P}_2(z_2)\textstyle\prod_{i=1}^2 \hat{P}_i(w_i)\right)\hat{\mathbf{F}}_1\left(z_1, z_2, \hat{\theta}_1\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_2(w_2)\right), w_2\right),\\ \hat{\mathbf{F}}_1(z_1, z_2, w_1, w_2) &= \hat{R}_2\left(P_1(z_1)\tilde{P}_2(z_2)\textstyle\prod_{i=1}^2 \hat{P}_i(w_i)\right)\hat{\mathbf{F}}_2\left(z_1, z_2, w_1, \hat{\theta}_2\left(P_1(z_1)\tilde{P}_2(z_2)\hat{P}_1(w_1)\right)\right).\end{aligned} \tag{37.4.3}$$

It's necessary to give an step ahead, considering the case illustrated in `Figure 2`, where just like before, the server's switchover times are given by the generals equations $R_i(\mathbf{z}, \mathbf{w}) = R_i\left(\tilde{P}_1(z_1)\tilde{P}_2(z_2)\tilde{P}_3(z_3)\tilde{P}_4(z_4)\right)$, with first order derivatives given by $D_i R_i = r_i\tilde{\mu}_i$, and second order partial derivatives $D_j D_i R_k = R_k^{(2)}\tilde{\mu}_i\tilde{\mu}_j + \mathbb{1}_{i=j} r_k P_i^{(2)} + \mathbb{1}_{i\neq j} r_k \tilde{\mu}_i\tilde{\mu}_j$ for any i, j, k. According to the equations given before and the queue lengths for the other system's server times, we can obtain general expressions

$$D_j\mathbf{F}_i(z_1, z_2; \tau_{i+2}) = \mathbb{1}_{j\leq 2} F_{j,i+2}^{(1)}, \quad D_j\mathbf{F}_i(z_3, z_4; \tau_{i-2}) = \mathbb{1}_{j\geq 3} F_{j,i-2}^{(1)}, \tag{37.4.4}$$

for $i, j = 1, 2, 3, 4$; with second order derivatives given by

$$\begin{aligned}D_j D_i\mathbf{F}_k(z_1, z_2; \tau_{k+2}) &= \mathbb{1}_{i\geq 3}\mathbb{1}_{j=i} F_{i,k+2}^{(2)} + \mathbb{1}_{i\geq 3}\mathbb{1}_{j\neq i} F_{j,k-2}^{(1)} F_{i,k+2}^{(1)},\\ D_j D_i\mathbf{F}_k(z_3, z_4; \tau_{k-2}) &= \mathbb{1}_{i\geq 3}\mathbb{1}_{j=i} F_{i,k-2}^{(2)} + \mathbb{1}_{i\geq 3}\mathbb{1}_{j\neq i} F_{j,k-2}^{(1)} F_{i,k-2}^{(1)}.\end{aligned} \tag{37.4.5}$$

According with the developed at the moment, we can get the recursive equations which are of the following form

$$\begin{aligned}\mathbf{F}_1(z_1, z_2, z_3, z_4) &= R_2\left(\textstyle\prod_{i=1}^4 \tilde{P}_i(z_i)\right)\mathbf{F}_2\left(z_1, \tilde{\theta}_2\left(\tilde{P}_1(z_1)\tilde{P}_3(z_3)\tilde{P}_4(z_4)\right), z_3, z_4\right),\\ \mathbf{F}_2(z_1, z_2, z_3, z_4) &= R_1\left(\textstyle\prod_{i=1}^4 \tilde{P}_i(z_i)\right)\mathbf{F}_1\left(\tilde{\theta}_1\left(\tilde{P}_2(z_2)\tilde{P}_3(z_3)\tilde{P}_4(z_4)\right), z_2, z_3, z_4\right),\\ \mathbf{F}_3(z_1, z_2, z_3, z_4) &= R_4\left(\textstyle\prod_{i=1}^4 \tilde{P}_i(z_i)\right)\mathbf{F}_4\left(z_1, z_2, z_3, \tilde{\theta}_4\left(\tilde{P}_1(z_1)\tilde{P}_2(z_2)\tilde{P}_3(z_3)\right)\right),\\ \mathbf{F}_4(z_1, z_2, z_3, z_4) &= R_3\left(\textstyle\prod_{i=1}^4 \tilde{P}_i(z_i)\right)\mathbf{F}_3\left(z_1, z_2, \tilde{\theta}_3\left(\tilde{P}_1(z_1)\tilde{P}_2(z_2)\tilde{P}_4(z_4)\right), z_4\right).\end{aligned} \tag{37.4.6}$$

So we have the first theorem

Teorema 37.4.1 *Suppose $\tilde{\mu} = \tilde{\mu}_1 + \tilde{\mu}_2 < 1$, $\hat{\mu} = \tilde{\mu}_3 + \tilde{\mu}_4 < 1$, then the number of users in the queues conforming the network of cyclic polling system (37.4.6), when the server visit a queue can be found solving the linear system given by equations (37.4.7) and (37.4.8):*

$$f_j(i) = r_{j+1}\tilde{\mu}_i + \mathbb{1}_{i\neq j+1} f_{j+1}(j+1)\frac{\tilde{\mu}_i}{1-\tilde{\mu}_{j+1}} + \mathbb{1}_{i=j} f_{j+1}(i) + \mathbb{1}_{j=1}\mathbb{1}_{i\geq 3} F_{i,j+1}^{(1)} + \mathbb{1}_{j=3}\mathbb{1}_{i\leq 2} F_{i,j+1}^{(1)} \tag{37.4.7}$$

$j = 1, 3$ *and* $i = 1, 2, 3, 4$.

$$f_j(i) = r_{j-1}\tilde{\mu}_i + \mathbb{1}_{i\neq j-1} f_{j-1}(j-1)\frac{\tilde{\mu}_i}{1-\tilde{\mu}_{j-1}} + \mathbb{1}_{i=j} f_{j-1}(i) + \mathbb{1}_{j=2}\mathbb{1}_{i\geq 3}F^{(1)}_{i,j-1} + \mathbb{1}_{j=4}\mathbb{1}_{i\leq 2}F^{(1)}_{i,j-1} \tag{37.4.8}$$

$j = 2, 4$ *and* $i = 1, 2, 3, 4$, *whose solutions are:*

$$\begin{aligned} f_i(j) &= (\mathbb{1}_{j=i-1} + \mathbb{1}_{j=i+1})\, r_j\tilde{\mu}_j + \mathbb{1}_{i=j}\left(\mathbb{1}_{i\leq 2}\frac{r\tilde{\mu}_i(1-\tilde{\mu}_i)}{1-\tilde{\mu}} + \mathbb{1}_{i\geq 2}\frac{\hat{r}\tilde{\mu}_i(1-\tilde{\mu}_i)}{1-\hat{\mu}}\right) \\ &+\mathbb{1}_{i=1}\mathbb{1}_{j\geq 3}\left(\tilde{\mu}_j\left(r_{i+1} + \frac{r\tilde{\mu}_{i+1}}{1-\tilde{\mu}}\right) + F^{(1)}_{j,i+1}\right) + \mathbb{1}_{i=3}\mathbb{1}_{j\geq 3}\left(\tilde{\mu}_j\left(r_{i+1} + \frac{\hat{r}\tilde{\mu}_{i+1}}{1-\hat{\mu}}\right) + F^{(1)}_{j,i+1}\right) \\ &+\mathbb{1}_{i=2}\mathbb{1}_{j\leq 2}\left(\tilde{\mu}_j\left(r_{i-1} + \frac{r\tilde{\mu}_{i-1}}{1-\tilde{\mu}}\right) + F^{(1)}_{j,i-1}\right) + \mathbb{1}_{i=4}\mathbb{1}_{j\leq 2}\left(\tilde{\mu}_j\left(r_{i-1} + \frac{\hat{r}\tilde{\mu}_{i-1}}{1-\hat{\mu}}\right) + F^{(1)}_{j,i-1}\right). \end{aligned} \tag{37.4.9}$$

Teorema 37.4.2 *For the system given in (37.4.6) we have that the second moments are in their general form*

$$\begin{aligned} f_1(i,k) &= D_kD_i\left(R_2 + \mathbf{F}_2 + \mathbb{1}_{i\geq 3}\mathbf{F}_4\right) + D_iR_2D_k\left(\mathbf{F}_2 + \mathbb{1}_{k\geq 3}\mathbf{F}_4\right) + D_iF_2D_k\left(R_2 + \mathbb{1}_{k\geq 3}\mathbf{F}_4\right) \\ &\qquad +\mathbb{1}_{i\geq 3}D_i\mathbf{F}_4D_k\left(R_2 + \mathbf{F}_2\right) \\ f_2(i,k) &= D_kD_i\left(R_1 + \mathbf{F}_1 + \mathbb{1}_{i\geq 3}\mathbf{F}_3\right) + D_iR_1D_k\left(\mathbf{F}_1 + \mathbb{1}_{k\geq 3}\mathbf{F}_3\right) + D_i\mathbf{F}_1D_k\left(R_1 + \mathbb{1}_{k\geq 3}\mathbf{F}_3\right) \\ &\qquad +\mathbb{1}_{i\geq 3}D_i\mathbf{F}_3D_k\left(R_1 + \mathbf{F}_1\right) \\ f_3(i,k) &= D_kD_i\left(R_4 + \mathbb{1}_{i\leq 2}\mathbf{F}_2 + \mathbf{F}_4\right) + D_i\tilde{R}_4D_k\left(\mathbb{1}_{k\leq 2}\mathbf{F}_2 + \mathbf{F}_4\right) + D_i\mathbf{F}_4D_k\left(R_4 + \mathbb{1}_{k\leq 2}\mathbf{F}_2\right) \\ &\qquad +\mathbb{1}_{i\leq 2}D_i\mathbf{F}_2D_k\left(R_4 + \mathbf{F}_4\right) \\ f_4(i,k) &= D_kD_i\left(R_3 + \mathbb{1}_{i\leq 2}\mathbf{F}_1 + \mathbf{F}_3\right) + D_iR_3D_k\left(\mathbb{1}_{k\leq 2}\mathbf{F}_1 + \mathbf{F}_3\right) + D_i\mathbf{F}_3D_k\left(R_3 + \mathbb{1}_{k\leq 2}\mathbf{F}_1\right) \\ &\qquad +\mathbb{1}_{i\leq 2}D_i\mathbf{F}_1D_k\left(R_3 + \mathbf{F}_3\right) \end{aligned} \tag{37.4.10}$$

Corolario 37.4.1 *Conforming the equations given in (37.4.10) the second order moments are obtained solving the linear systems given by (37.5.2). These solutions are*

$$\begin{aligned} &f_1(1,1) = b_3, && f_2(2,2) = \tfrac{b_2}{1-b_1}, \\ &f_1(1,3) = a_4\left(\tfrac{b_2}{1-b_1}\right) + a_5K_{12} + K_3, && f_1(1,4) = a_6\left(\tfrac{b_2}{1-b_1}\right) + a_7K_{12} + K_4, \\ &f_1(3,3) = a_8\left(\tfrac{b_2}{1-b_1}\right) + K_8, && f_1(3,4) = a_9\left(\tfrac{b_2}{1-b_1}\right) + K_9, \\ &f_1(4,4) = a_{10}\left(\tfrac{b_2}{1-b_1}\right) + a_5K_{12} + K_{10}, && f_2(2,3) = a_{14}b_3 + a_{15}K_2 + K_{16}, \\ &f_2(2,4) = a_{16}b_3 + a_{17}K_2 + K_{17}, && f_2(3,3) = a_{18}b_3 + K_{18}, \\ &f_2(3,4) = a_{19}b_3 + K_{19}, && f_2(4,4) = a_{20}b_3 + K_{20}, \\ &f_3(3,3) = \tfrac{b_5}{1-b_4}, && f_4(4,4) = b_6, \\ &f_3(1,1) = a_{21}b_6 + K_{21}, && f_3(1,2) = a_{22}b_6 + K_{22}, \\ &f_3(1,3) = a_{23}b_6 + a_{24}K_{39} + K_{23}, && f_3(2,2) = a_{25}b_6 + K_{25}, \\ &f_3(2,3) = a_{26}b_6 + a_{27}K_{39} + K_{26}, && f_4(1,1) = a_{31}\left(\tfrac{b_5}{1-b_4}\right) + K_{31}, \\ &f_4(1,2) = a_{32}\left(\tfrac{b_5}{1-b_4}\right) + K_{32}, && f_4(1,4) = a_{33}\left(\tfrac{b_5}{1-b_4}\right) + a_{34}K_{29} + K_{31}, \\ &f_4(2,2) = a_{35}\left(\tfrac{b_5}{1-b_4}\right) + K_{35}, && f_4(2,4) = a_{36}\left(\tfrac{b_5}{1-b_4}\right) + a_{37}K_{29} + K_{37}. \end{aligned} \tag{37.4.11}$$

where

$$\begin{aligned} &N_1 = a_2K_{12} + a_3K_{11} + K_1, && N_2 = a_{12}K_2 + a_{13}K_5 + K_{15}, && b_1 = a_1a_{11}, \\ &b_2 = a_{11}N_1 + N_2, && b_3 = a_1\left(\tfrac{b_2}{1-b_1}\right) + N_1, && N_3 = a_{29}K_{39} + a_{30}K_{38} + K_{28}, \\ &N_4 = a_{39}K_{29} + a_{40}K_{30} + K_{40}, && b_4 = a_{28}a_{38}, && b_5 = a_{28}N_4 + N_3, \\ & && b_6 = a_{38}\left(\tfrac{b_5}{1-b_4}\right) + N_4. \end{aligned}$$

The values for the a_i's and K_i can be found in *Appendix B*. Finally

Definición 37.4.1 *Let* L_i^* *be the number of users at queue* Q_i *when it is polled, then*

$$\mathbb{E}\left[L_i^*\right] = f_i(i), \quad Var\left[L_i^*\right] = f_i(i,i) + \mathbb{E}\left[L_i^*\right] - \mathbb{E}\left[L_i^*\right]^2. \tag{37.4.12}$$

37.4.2. Stability Analysis

We are interested in determine the queue lengths at any time, not just when the server arrives to the queue to start attending according to the exhaustive policy. For this purpose we need to make assumptions over the processes involved in order to guarantee the stability of the Network.

First of all we are going to assume the arrival processes are Poisson, the service time are exponential. In 1973 Disney [16] prove that the only stationary system $M/G/1/L$, with renewal departure process are the $M/M/1$ y $M/D/1/1$ systems, also this implies that the output process is Poisson with the same rate of the arrival process. The switchover times has no particular distribution, the only condition they have to satisfy is the first moment finite.

Sigman, Thorison and Wolff [40] proved that if there is a first regeneration time then exist a non decreasing infinite sequence of regeneration times. With this in consideration we have the following theorem

Teorema 37.4.3 *Given a Network of Cyclic Polling Systems (NCPS) conformed by two cyclic polling systems, each of them with $M/M/1$ queues. Both systems are related by users transfer between the queues Q_1, Q_3 and Q_2, Q_4. Suppose $\tilde{\mu}, \hat{\mu} < 1$. Let's define the following events for the arrival processes at time t: $A_j(t) = \{0$ arrivals on Q_j at time $t\}$, for some $t \geq 0$ and queue Q_j in the NCPS for $j = 1, 2, 3, 4$. Then there exist an non empty interval I such that for $T^* \in I$ the $\mathbb{P}\{A_1(T^*), A_2(Tt^*), A_3(T^*), A_4(T^*) | T^* \in I\} > 0$ is satisfied.*

Demostración 37.4.1 *Without of loss of generality we are going to consider as base of the analysis the queue Q_1 from the first system.*

Let's $n \geq 1$ cycle for the first system, so let's be $\overline{\tau}_1(n)$ time the server ends attending en queue Q_1, it means $L_j(\overline{\tau}_1(n)) = 0$. The server incurrs in a switchover time to traslate to the other queue, which is a random variable whose realitation is $r_1(n) > 0$, then we have that $\tau_2(n) = \overline{\tau}_1(n) + r_1(n)$.

Let's be $I_1 \equiv [\overline{\tau}_1(n), \tau_2(n)]$ the intreval with length $\xi_1 = r_1(n)$. Given that the arrival times are exponentials with rate $\tilde{\mu}_1 = \mu_1 + \hat{\mu}_1$ and the transfer users process from queue Q_3 are exponentials with rate $\hat{\mu}_1$, we have that the event $A_1(t)$ has probability given by

$$\mathbb{P}\{A_1(t) | t \in I_1(n)\} = e^{-\tilde{\mu}_1 \xi_1(n)}. \tag{37.4.13}$$

In the other side, for the queue Q_2, the time $\overline{\tau}_2(n-1)$ is such that $L_2(\overline{\tau}_2(n-1)) = 0$, it means, it's the time when the queue is emptied by the server en the previous cycle. So we have a second time interval $I_2 \equiv [\overline{\tau}_2(n-1), \tau_2(n)]$ so the event $A_2(t)$ has probability

$$\mathbb{P}\{A_2(t) | t \in I_2(n)\} = e^{-\tilde{\mu}_2 \xi_2(n)}, \tag{37.4.14}$$

with length $\xi_2(n) = \tau_2(n) - \overline{\tau}_2(n-1)$. Given the time intervals construction we have that $I_1(n) \subset I_2(n)$, therefore $\xi_1(n) \leq \xi_2(n)$ so $-\xi_1(n) \geq -\xi_2(n)$ then $-\tilde{\mu}_2 \xi_1(n) \geq -\tilde{\mu}_2 \xi_2(n)$ and finally $e^{-\tilde{\mu}_2 \xi_1(n)} \geq e^{-\tilde{\mu}_2 \xi_2(n)}$, then

$$\mathbb{P}\{A_2(t) | t \in I_1(n)\} \geq \mathbb{P}\{A_2(t) | t \in I_2(n)\}. \tag{37.4.15}$$

Now we can determine the joint conditional probability on the interval $I_1(n)$

$$\begin{aligned} \mathbb{P}\{A_1(t), A_2(t) | t \in I_1(n)\} &= \mathbb{P}\{A_1(t) | t \in I_1(n)\} \mathbb{P}\{A_2(t) | t \in I_1(n)\} \\ &\geq \mathbb{P}\{A_1(t) | t \in I_1(n)\} \mathbb{P}\{A_2(t) | t \in I_2(n)\} \\ &= e^{-\tilde{\mu}_1 \xi_1(n)} e^{-\tilde{\mu}_2 \xi_2(n)} = e^{-[\tilde{\mu}_1 \xi_1(n) + \tilde{\mu}_2 \xi_2(n)]}. \end{aligned}$$

It means

$$\mathbb{P}\{A_1(t), A_2(t) | t \in I_1(n)\} = e^{-[\tilde{\mu}_1 \xi_1(n) + \tilde{\mu}_2 \xi_2(n)]} > 0. \tag{37.4.16}$$

With respect the relation between both systems, there exists some $m \geq 1$ such that $\tau_3(m) < \tau_2(n) < \tau_4(m)$ therefore we have the following cases for $\tau_2(n)$:

2

a) $\tau_3(m) < \tau_2(n) < \overline{\tau}_3(m)$,

b) $\overline{\tau}_3(m) < \tau_2(n) < \tau_4(m)$,

c) $\tau_4(m) < \tau_2(n) < \overline{\tau}_4(m)$,

d) $\overline{\tau}_4(m) < \tau_2(n) < \tau_3(m+1)$.

First consider the time interval $I_3(m) \equiv [\tau_3(m), \overline{\tau}_3(m)]$ such that $\tau_2(n) \in I_3(m)$, with length $\xi_3 \equiv \overline{\tau}_3(m) - \tau_3(m)$, then we have for the queue Q_3

$$\mathbb{P}\{A_3(t) | t \in I_3(m)\} = e^{-\tilde{\mu}_3 \xi_3(m)}. \tag{37.4.17}$$

whereas for Q_4 lets consider the time interval $I_4(m) \equiv [\tau_4(m-1), \overline{\tau}_3(m)]$, then we have that $I_3(m) \subset I_4(m)$, therefore in a similar manner that we have done for Q_1 and Q_2 we obtain

$$\mathbb{P}\{A_4(t) | t \in I_3(m)\} \geq \mathbb{P}\{A_4(t) | t \in I_4(m)\} \tag{37.4.18}$$

and

$$\mathbb{P}\{A_3(t), A_4(t) | t \in I_3(m)\} \geq e^{-(\tilde{\mu}_3 \xi_3(m) + \tilde{\mu}_4 \xi_4(m))} > 0. \tag{37.4.19}$$

For the rest of the cases the demonstration is similar. It means we always can find a time interval where we can guarantee there is no arrivals to the queues in each system with positive probability.

By construction we have that $I(n,m) \equiv I_1(n) \cap I_3(m) \neq \emptyset$, then in particular we have the following contentions $I(n,m) \subseteq I_1(n)$ and $I(n,m) \subseteq I_3(m)$, therefore if we define $\xi(n,m)$ as the length of the interval $I(n,m)$ we have $\xi(n,m) \leq \xi_1(n)$, $\xi(n,m) \leq \xi_3(m)$, then $-\xi(n,m) \geq -\xi_1(n)$ and finally $-\xi(n,m) \leq -\xi_3(m)$ therefore we have the following 2

1. $-\tilde{\mu}_1 \xi_{n,m} \geq -\tilde{\mu}_1 \xi_1(n)$,
2. $-\tilde{\mu}_2 \xi_{n,m} \geq -\tilde{\mu}_2 \xi_1(n) \geq -\tilde{\mu}_2 \xi_2(n)$,

3. $-\tilde{\mu}_3\xi_{n,m} \geq -\tilde{\mu}_3\xi_3(m)$,
4. $-\tilde{\mu}_4\xi_{n,m} \geq -\tilde{\mu}_4\xi_3(m) \geq -\tilde{\mu}_4\xi_4(m)$.

Let's $T^* \in I(n,m)$, then given that in particular $T^* \in I_1(n)$, there is no arrivals to the queues Q_1 and Q_2, therefore there is no transfer users from Q_3 and Q_4, it means, $\tilde{\mu}_1 = \mu_1$, $\tilde{\mu}_2 = \mu_2$, $\tilde{\mu}_3 = \mu_3$, $\tilde{\mu}_4 = \mu_4$, thats it, the events A_1 and A_3 are conditionally independent in the interval $I(n,m)$; the same goes for the events A_2 and A_4, therefore we have

$$\begin{aligned}&\mathbb{P}\{A_1(T^*), A_2(T^*), A_3(T^*), A_4(T^*) | T^* \in I(n,m)\} = \prod_{j=1}^{4} \mathbb{P}\{A_j(T^*) | T^* \in I(n,m)\} \\ &\geq \mathbb{P}\{A_1(T^*) | T^* \in I_1(n)\}\mathbb{P}\{A_2(T^*) | T^* \in I_2(n)\}\mathbb{P}\{A_3(T^*) | T^* \in I_3(m)\}\mathbb{P}\{A_4(T^*) | T^* \in I_4(m)\} \\ &= e^{-\mu_1\xi_1(n)}e^{-\mu_2\xi_2(n)}e^{-\mu_3\xi_3(m)}e^{-\mu_4\xi_4(m)} = e^{-[\tilde{\mu}_1\xi_1(n)+\tilde{\mu}_2\xi_2(n)+\tilde{\mu}_3\xi_3(m)+\tilde{\mu}_4\xi_4(m)]} > 0.\end{aligned} \tag{37.4.20}$$

Now we only need to prove that for $n \geq 1$, there exist an $m \geq 1$ such that the cases mentioned before are satisfied:

2

a) $\tau_3(m) < \tau_2(n) < \overline{\tau}_3(m)$,
b) $\overline{\tau}_3(m) < \tau_2(n) < \tau_4(m)$,
c) $\tau_4(m) < \tau_2(n) < \overline{\tau}_4(m)$,
d) $\overline{\tau}_4(m) < \tau_2(n) < \tau_3(m+1)$.

We only give the proof for the fist case, for the rest the demonstration are similar. Suppose there is no $m \geq 1$, with $I_1(n) \cap I_3(m) \neq \emptyset$, it means that for all $m \geq 1$, $I_1(n) \cap I_3(m) = \emptyset$, then we have only two cases

a) *$\tau_2(n) \leq \tau_3(m)$: Recall that $\tau_2(m) = \overline{\tau}_1 + r_1(m)$ where each of the random variables are such that $\mathbb{E}[\overline{\tau}_1(n) - \tau_1(n)] < \infty$, $\mathbb{E}[R_1] < \infty$ y $\mathbb{E}[\tau_3(m)] < \infty$, which contradicts the fact that there is no such $m \geq 1$.*
b) *$\tau_2(n) \geq \overline{\tau}_3(m)$: the reasoning is similar to the previous given.*

According to the stablished in Sigman, Thorison and Wolff [40] theorem (37.10.1) allow us to ensure that there is an infinite sequence of regeneration times, let $T_1, T_2, \ldots$ considered as the regeneration points, then we have that just like in Takagi [42], the following definition

Definición 37.4.2 *the interval between two such succesive regeneration points will be called regenerative cycle.*

And for the regeneration points

Definición 37.4.3 *Let M_i be the number of polling cycles in a regenerative cycle.*

Definición 37.4.4 *Considering the M_i's, the duration of the m-th polling cycle in a regeneration cycle will be denoted by $C_i^{(m)}$, for $m = 1, 2, \ldots, M_i$.*

And finally, the mean polling cycle time is defined by

Definición 37.4.5

$$\mathbb{E}[C_i] = \frac{\sum_{m=1}^{M_i} \mathbb{E}\left[C_i^{(m)}\right]}{\mathbb{E}[M_i]} \tag{37.4.21}$$

Teorema 37.4.4 *The process $\{C_i : i = 1, 2, \ldots, M_i\}$ is a regenerative process. Also there exists a regenerative and stationary process as function of this process.*

With this in mind let denote by L_i the number of users at queue Q_i at arbitrary times. Their generating probability function will be denoted by $Q_i(z)$ which is also given by the time average of $z^{L_i(t)}$ over the regenerative cycled defined before so we have

$$Q_i(z) \quad = \quad \mathbb{E}\left[z^{L_i(t)}\right] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i}\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}\left[\sum_{m=1}^{M_i}\tau_i(m+1) - \tau_i(m)\right]}$$

which can be rewritten as

$$Q_i(z) = \frac{1}{\mathbb{E}[C_i]} \cdot \frac{1 - F_i(z)}{P_i(z) - z} \cdot \frac{(1-z)P_i(z)}{1 - P_i(z)} \tag{37.4.22}$$

If we define the following

$$S(z) = 1 - F(z), \quad T(z) = z - P(z), \quad U(z) = 1 - P(z). \tag{37.4.23}$$

then

$$\mathbb{E}\left[C_i\right] Q\left(z\right) = \frac{\left(z-1\right) S\left(z\right) P\left(z\right)}{T\left(z\right) U\left(z\right)}. \tag{37.4.24}$$

Where if we define $a_k = P\left\{L\left(t\right) = k\right\}$ then

$$S\left(z\right) = 1 - F\left(z\right) = 1 - \sum_{k=0}^{+\infty} a_k z^k$$

therefore $S^{'}\left(z\right) = -\sum_{k=1}^{+\infty} k a_k z^{k-1}$, with $S^{(1)}\left(1\right) = -\sum_{k=1}^{+\infty} k a_k = -\mathbb{E}\left[L\left(t\right)\right]$, and $S^{''}\left(z\right) = -\sum_{k=2}^{+\infty} k(k-1) a_k z^{k-2}$ so $S^{(2)}\left(1\right) = -\sum_{k=2}^{+\infty} k(k-1) a_k = \mathbb{E}\left[L\left(L-1\right)\right]$; in the same way we obtain $S^{'''}\left(z\right) = -\sum_{k=3}^{+\infty} k(k-1)(k-2) a_k z^{k-3}$ and $S^{(3)}\left(1\right) = -\sum_{k=3}^{+\infty} k(k-1)(k-2) a_k = -\mathbb{E}\left[L\left(L-1\right)\left(L-2\right)\right] = -\mathbb{E}\left[L^3\right] + 3 - \mathbb{E}\left[L^2\right] - 2 - \mathbb{E}\left[L\right]$.
it means

$$\begin{array}{l} S^{(1)}\left(1\right) = -\mathbb{E}\left[L\left(t\right)\right], \\ S^{(2)}\left(1\right) = -\mathbb{E}\left[L\left(L-1\right)\right] = -\mathbb{E}\left[L^2\right] + \mathbb{E}\left[L\right], \\ S^{(3)}\left(1\right) = -\mathbb{E}\left[L\left(L-1\right)\left(L-2\right)\right] = -\mathbb{E}\left[L^3\right] + 3\mathbb{E}\left[L^2\right] - 2\mathbb{E}\left[L\right]. \end{array} \tag{37.4.25}$$

expanding around $z = 1$

$$\begin{aligned} S\left(z\right) &= S\left(1\right) + \frac{S^{'}\left(1\right)}{1!}\left(z-1\right) + \frac{S^{''}\left(1\right)}{2!}\left(z-1\right)^2 + \frac{S^{'''}\left(1\right)}{3!}\left(z-1\right)^3 + \ldots + \\ &= \left(z-1\right)\left\{S^{'}\left(1\right) + \frac{S^{''}\left(1\right)}{2!}\left(z-1\right) + \frac{S^{'''}\left(1\right)}{3!}\left(z-1\right)^2 + \ldots + \right\} \\ &= \left(z-1\right) R_1\left(z\right) \end{aligned}$$

with $R_1\left(z\right) \neq 0$, given that $R_1\left(z\right) = -\mathbb{E}\left[L\right]$ then

$$R_1\left(z\right) = S^{'}\left(1\right) + \frac{S^{''}\left(1\right)}{2!}\left(z-1\right) + \frac{S^{'''}\left(1\right)}{3!}\left(z-1\right)^2 + \frac{S^{iv}\left(1\right)}{4!}\left(z-1\right)^3 + \ldots + \tag{37.4.26}$$

Calculating the derivatives and evaluating in $z = 1$

$$\begin{array}{l} R_1\left(1\right) = S^{(1)}\left(1\right) = -\mathbb{E}\left[L\right] \\ R_1^{(1)}\left(1\right) = \frac{1}{2} S^{(2)}\left(1\right) = -\frac{1}{2}\mathbb{E}\left[L^2\right] + \frac{1}{2}\mathbb{E}\left[L\right] \\ R_1^{(2)}\left(1\right) = \frac{2}{3!} S^{(3)}\left(1\right) = -\frac{1}{3}\mathbb{E}\left[L^3\right] + \mathbb{E}\left[L^2\right] - \frac{2}{3}\mathbb{E}\left[L\right] \end{array} \tag{37.4.27}$$

In a similar manner for $T\left(z\right) = z - P\left(z\right)$ can be found an expansion around $z = 1$:

$$\begin{aligned} T\left(z\right) &= T\left(1\right) + \frac{T^{'}\left(1\right)}{1!}\left(z-1\right) + \frac{T^{''}\left(1\right)}{2!}\left(z-1\right)^2 + \frac{T^{'''}\left(1\right)}{3!}\left(z-1\right)^3 + \ldots + \\ &= \left(z-1\right)\left\{T^{'}\left(1\right) + \frac{T^{''}\left(1\right)}{2!}\left(z-1\right) + \frac{T^{'''}\left(1\right)}{3!}\left(z-1\right)^2 + \ldots + \right\} \\ &= \left(z-1\right) R_2\left(z\right) \end{aligned}$$

where

$$\begin{array}{l} T^{(1)}\left(1\right) = -\mathbb{E}\left[X\left(t\right)\right] = -\mu, \\ T^{(2)}\left(1\right) = -\mathbb{E}\left[X\left(X-1\right)\right] = -\mathbb{E}\left[X^2\right] + \mathbb{E}\left[X\right] = -\mathbb{E}\left[X^2\right] + \mu, \\ T^{(3)}\left(1\right) = -\mathbb{E}\left[X\left(X-1\right)\left(X-2\right)\right] = -\mathbb{E}\left[X^3\right] + 3\mathbb{E}\left[X^2\right] - 2\mathbb{E}\left[X\right] \\ = -\mathbb{E}\left[X^3\right] + 3\mathbb{E}\left[X^2\right] - 2\mu. \end{array} \tag{37.4.28}$$

therefore $R_2\left(1\right) \neq 0$, because

$$R_2\left(1\right) = 1 - \mathbb{E}\left[X\right] = 1 - \mu \tag{37.4.29}$$

then

$$R_2\left(z\right) = T^{'}\left(1\right) + \frac{T^{''}\left(1\right)}{2!}\left(z-1\right) + \frac{T^{'''}\left(1\right)}{3!}\left(z-1\right)^2 + \frac{T^{(iv)}\left(1\right)}{4!}\left(z-1\right)^3 + \ldots + \tag{37.4.30}$$

Calculating the derivatives and evaluating $z = 1$

$$\begin{array}{l} R_2(1) = T^{(1)}(1) = 1-\mu \\ R_2^{(1)}(1) = \frac{1}{2}T^{(2)}(1) = -\frac{1}{2}\mathbb{E}\left[X^2\right] + \frac{1}{2}\mu \\ R_2^{(2)}(1) = \frac{2}{3!}T^{(3)}(1) = -\frac{1}{3}\mathbb{E}\left[X^3\right] + \mathbb{E}\left[X^2\right] - \frac{2}{3}\mu \end{array} \tag{37.4.31}$$

Finally proceeding in analogous manner for $U(z) = 1 - P(z)$ also can be found an expansion around $z = 1$

$$\begin{array}{l} U(z) = U(1) + \frac{U^{'}(1)}{1!}(z-1) + \frac{U^{''}(1)}{2!}(z-1)^2 + \frac{U^{'''}(1)}{3!}(z-1)^3 + \ldots + \\ = (z-1)\left\{U^{'}(1) + \frac{U^{''}(1)}{2!}(z-1) + \frac{U^{'''}(1)}{3!}(z-1)^2 + \ldots + \right\} = (z-1)R_3(z) \end{array}$$

where

$$\begin{array}{l} U^{(1)}(1) = -\mathbb{E}[X(t)] = -\mu, \\ U^{(2)}(1) = -\mathbb{E}[X(X-1)] = -\mathbb{E}\left[X^2\right] + \mathbb{E}[X] = -\mathbb{E}\left[X^2\right] + \mu, \\ U^{(3)}(1) = -\mathbb{E}[X(X-1)(X-2)] = -\mathbb{E}\left[X^3\right] + 3\mathbb{E}\left[X^2\right] - 2\mathbb{E}[X] \\ = -\mathbb{E}\left[X^3\right] + 3\mathbb{E}\left[X^2\right] - 2\mu. \end{array}$$

Therefore $R_3(1) \neq 0$, because

$$R_3(1) = -\mathbb{E}[X] = -\mu \tag{37.4.32}$$

then

$$R_3(z) \quad = \quad U^{'}(1) + \frac{U^{''}(1)}{2!}(z-1) + \frac{U^{'''}(1)}{3!}(z-1)^2 + \frac{U^{(iv)}(1)}{4!}(z-1)^3 + \ldots + \tag{37.4.33}$$

calculating the derivatives and evaluating in $z = 1$

$$\begin{array}{l} R_3(1) = U^{(1)}(1) = -\mu \\ R_3^{(1)}(1) = \frac{1}{2}U^{(2)}(1) = -\frac{1}{2}\mathbb{E}\left[X^2\right] + \frac{1}{2}\mu \\ R_3^{(2)}(1) = \frac{2}{3!}U^{(3)}(1) = -\frac{1}{3}\mathbb{E}\left[X^3\right] + \mathbb{E}\left[X^2\right] - \frac{2}{3}\mu \end{array} \tag{37.4.34}$$

Then we have that

$$\mathbb{E}[C_i]\,Q(z) \quad = \quad \frac{(z-1)(z-1)R_1(z)P(z)}{(z-1)R_2(z)(z-1)R_3(z)} = \frac{R_1(z)P(z)}{R_2(z)R_3(z)} \equiv \frac{R_1P}{R_2R_3} \tag{37.4.35}$$

Calcuating the derivative with respect z

$$\left[\frac{R_1(z)P(z)}{R_2(z)R_3(z)}\right]^{'} \quad = \quad \frac{PR_2R_3R_1^{'} + R_1R_2R_3P^{'} - R_3R_1PR_2 - R_2R_1PR_3^{'}}{(R_2R_3)^2} \tag{37.4.36}$$

evauatong in $z = 1$

$$\begin{aligned} &= \frac{R_2(1)R_3(1)R_1^{(1)}(1) + R_1(1)R_2(1)R_3(1)P^{'}(1) - R_3(1)R_1(1)R_2(1)^{(1)} - R_2(1)R_1(1)R_3^{'}(1)}{(R_2(1)R_3(1))^2} \\ &= \frac{1}{(1-\mu)^2\mu^2}\left\{\left(-\frac{1}{2}\mathbb{E}L^2 + \frac{1}{2}\mathbb{E}L\right)(1-\mu)(-\mu) + (-\mathbb{E}L)(1-\mu)(-\mu)\mu \right. \\ &\quad \left. -\left(-\frac{1}{2}\mathbb{E}X^2 + \frac{1}{2}\mu\right)(-\mu)(-\mathbb{E}L) - (1-\mu)(-\mathbb{E}L)\left(-\frac{1}{2}\mathbb{E}X^2 + \frac{1}{2}\mu\right)\right\} \\ &= \frac{1}{(1-\mu)^2\mu^2}\left\{\left(-\frac{1}{2}\mathbb{E}L^2 + \frac{1}{2}\mathbb{E}L\right)\left(\mu^2 - \mu\right) + \left(\mu^2 - \mu^3\right)\mathbb{E}L \right. \\ &\quad \left. -\mu\mathbb{E}L\left(-\frac{1}{2}\mathbb{E}X^2 + \frac{1}{2}\mu\right) + (\mathbb{E}L - \mu\mathbb{E}L)\left(-\frac{1}{2}\mathbb{E}X^2 + \frac{1}{2}\mu\right)\right\} \\ &= \frac{1}{(1-\mu)^2\mu^2}\left\{-\frac{1}{2}\mu^2\mathbb{E}L^2 + \frac{1}{2}\mu\mathbb{E}L^2 + \frac{1}{2}\mu^2\mathbb{E}L - \mu^3\mathbb{E}L + \mu\mathbb{E}L\mathbb{E}X^2 - \frac{1}{2}\mathbb{E}L\mathbb{E}X^2\right\} \\ &= \frac{1}{(1-\mu)^2\mu^2}\left\{\frac{1}{2}\mu\mathbb{E}L^2(1-\mu) + \mathbb{E}L\left(\frac{1}{2} - \mu\right)\left(\mu^2 - \mathbb{E}X^2\right)\right\} \\ &= \frac{1}{2\mu(1-\mu)}\mathbb{E}L^2 - \frac{\frac{1}{2} - \mu}{(1-\mu)^2\mu^2}\sigma^2\mathbb{E}L \end{aligned}$$

Then we get (Takagi's formula)

$$Q^{(1)} = \frac{1}{\mathbb{E}C}\left\{\frac{1}{2\mu(1-\mu)}\mathbb{E}L^2 - \frac{\frac{1}{2}-\mu}{(1-\mu)^2\mu^2}\sigma^2\mathbb{E}L\right\}$$

with

$$\mathbb{E}C = \frac{\mathbb{E}L}{\mu(1-\mu)}$$

therefore

$$\begin{aligned} Q^{(1)} &= \frac{1}{2}\frac{\mathbb{E}L^2}{\mathbb{E}L} - \frac{\frac{1}{2}-\mu}{(1-\mu)\mu}\sigma^2 = \frac{\mathbb{E}L^2}{2\mathbb{E}L} - \frac{\sigma^2}{2}\left\{\frac{2\mu-1}{(1-\mu)\mu}\right\} \\ &= \frac{\mathbb{E}L^2}{2\mathbb{E}L} + \frac{\sigma^2}{2}\left\{\frac{1}{1-\mu}+\frac{1}{\mu}\right\} \end{aligned}$$

while for us

$$Q^{(1)} = \frac{1}{\mu(1-\mu)}\frac{\mathbb{E}L^2}{2\mathbb{E}C} - \sigma^2\frac{\mathbb{E}L}{2\mathbb{E}C}\cdot\frac{1-2\mu}{(1-\mu)^2\mu^2}.$$

Now, reconsider the equation (37.10.21)

$$\left[\frac{R_1(z)P(z)}{R_2(z)R_3(z)}\right]' = \frac{PR_2R_3R_1' + R_1R_2R_3P' - R_3R_1PR_2 - R_2R_1PR_3'}{(R_2R_3)^2} \equiv \frac{F(z)}{G(z)}$$

where

$$\begin{aligned} &F(z) = PR_2R_3R_1' + R_1R_2R_3P' - R_3R_1PR_2' - R_2R_1PR_3' \\ &G(z) = R_2^2R_3^2 \\ &G^2(z) = R_2^4R_3^4 = (1-\mu)^4\mu^4 \end{aligned} \tag{37.4.37}$$

so

$$\begin{aligned} &G'(z) = 2R_2R_3\left[R_2'R_3 + R_2R_3'\right] \\ &G'(1) = -2(1-\mu)\mu\left[\left(-\tfrac{1}{2}\mathbb{E}\left[X^2\right]+\tfrac{1}{2}\mu\right)(-\mu) + (1-\mu)\left(-\tfrac{1}{2}\mathbb{E}\left[X^2\right]+\tfrac{1}{2}\mu\right)\right] \\ &F'(z) = \left[(R_2R_3)R_1'' - (R_1R_3)R_2'' - (R_1R_2)R_3'' - 2\left(R_2'R_3'\right)R_1\right]P + 2(R_2R_3)R_1'P' + (R_1R_2R_3)P''. \end{aligned} \tag{37.4.38}$$

Now, let us calculate $F'(z)G(z) + F(z)G'(z)$:

$$\begin{aligned} F'(z)G(z) + F(z)G'(z) = &\left\{\left[(R_2R_3)R_1'' - (R_1R_3)R_2'' - (R_1R_2)R_3'' - 2\left(R_2'R_3'\right)R_1\right]P\right. \\ &\left.+2(R_2R_3)R_1'P' + (R_1R_2R_3)P''\right\}R_2^2R_3^2 - \left\{\left[PR_2R_3R_1' + R_1R_2R_3P' - R_3R_1PR_2'\right.\right. \\ &\left.\left.-R_2R_1PR_3'\right]\left[2R_2R_3\left(R_2'R_3 + R_2R_3'\right)\right]\right\} \end{aligned}$$

now evaluate in $z = 1$

$$\begin{aligned} F'(1)G(1) &+ F(1)G'(1) = (1+R_3)^3R_3^3R_1'' - (1+R_3)^2R_1R_3^3R_3'' - (1+R_3)^3R_3^2R_1R_3'' \\ &- 2(1+R_3)^2R_3^2\left(R_3'\right)^2 \\ &+ 2(1+R_3)^3R_3^3R_1'P' + (1+R_3)^3R_3^3R_1P'' - 2(1+R_3)^2R_3^2(1+2R_3)R_3'R_1' \\ &- 2(1+R_3)^2R_3^2R_1R_3'(1+2R_3)P' + 2(1+R_3)(1+2R_3)R_3^3R_1\left(R_3'\right)^2 \\ &+ 2(1+R_3)^2(1+2R_3)R_1R_3R_3' \\ &= -(1-\mu)^3\mu^3R_1'' - (1-\mu)^2\mu^2R_1(1-2\mu)R_3'' - (1-\mu)^3\mu^3R_1P'' \\ &+ 2(1-\mu)\mu^2\left[(1-2\mu)R_1 - (1-\mu)\right]\left(R_3'\right)^2 - 2(1-\mu)^2\mu R_1(1-2\mu)R_3' \\ &- 2(1-\mu)^3\mu^4R_1' - 2\mu(1-\mu)(1-2\mu)R_3'R_1' - 2\mu^3(1-\mu)^2(1-2\mu)R_1R_1' \end{aligned}$$

therefore

$$\begin{aligned}\left[\frac{F(z)}{G(z)}\right]' &= \frac{1}{\mu^3(1-\mu)^3}\Big\{-(1-\mu)^2\mu^2 R_1'' - \mu(1-\mu)(1-2\mu)R_1R_3'' - \mu^2(1-\mu)^2 R_1 P'' \\ &\quad +2\mu\left[(1-2\mu)R_1-(1-\mu)\right]\left(R_3'\right)^2 - 2(1-\mu)(1-2\mu)R_1R_3' - 2\mu^3(1-\mu)^2 R_1' \\ &\quad -2(1-2\mu)R_3'R_1' - 2\mu^2(1-\mu)(1-2\mu)R_1R_1'\Big\}\end{aligned}$$

recall that

$$\begin{aligned}
R_1 &= -\mathbb{E}L \\
R_3 &= -\mu \\
R_1' &= -\frac{1}{2}\mathbb{E}L^2 + \frac{1}{2}\mathbb{E}L \\
R_3' &= -\frac{1}{2}\mathbb{E}X^2 + \frac{1}{2}\mu \\
R_1'' &= -\frac{1}{3}\mathbb{E}L^3 + \mathbb{E}L^2 - \frac{2}{3}\mathbb{E}L \\
R_3'' &= -\frac{1}{3}\mathbb{E}X^3 + \mathbb{E}X^2 - \frac{2}{3}\mu \\
R_1R_3' &= \frac{1}{2}\mathbb{E}X^2\mathbb{E}L - \frac{1}{2}\mathbb{E}X\mathbb{E}L \\
R_1R_1' &= \frac{1}{2}\mathbb{E}L^2\mathbb{E}L + \frac{1}{2}\mathbb{E}^2L \\
R_3'R_1' &= \frac{1}{4}\mathbb{E}X^2\mathbb{E}L^2 - \frac{1}{4}\mathbb{E}X^2\mathbb{E}L - \frac{1}{4}\mathbb{E}L^2\mathbb{E}X + \frac{1}{4}\mathbb{E}X\mathbb{E}L \\
R_1R_3'' &= \frac{1}{6}\mathbb{E}X^3\mathbb{E}L^2 - \frac{1}{6}\mathbb{E}X^3\mathbb{E}L - \frac{1}{2}\mathbb{E}L^2\mathbb{E}X^2 + \frac{1}{2}\mathbb{E}X^2\mathbb{E}L + \frac{1}{3}\mathbb{E}X\mathbb{E}L^2 - \frac{1}{3}\mathbb{E}X\mathbb{E}L \\
R_1P'' &= -\mathbb{E}X^2\mathbb{E}L \\
\left(R_3'\right)^2 &= \frac{1}{4}\mathbb{E}^2X^2 - \frac{1}{2}\mathbb{E}X^2\mathbb{E}X + \frac{1}{4}\mathbb{E}^2X
\end{aligned}$$

37.5. Appendix A: General Case Calculations Exhaustive Policy

Remember the equations given in equations (37.4.4) and (37.4.10) for the first and second order partial derivatives respectively. The first moments equations for the queue lengths as before for the times the server arrives to the queue to start attending are obtained solving the system given by $f_1(i) = D_i R_2 + D_i \mathbf{F}_2 + \mathbb{1}_{i\geq 3} D_i \mathbf{F}_4$, similar expressions of the queues for the rest give us the linear system

$$\begin{array}{ll}
f_1(1) = r_2\tilde{\mu}_1 + \frac{\tilde{\mu}_1}{1-\tilde{\mu}_2} f_2(2) + f_2(1), & f_1(2) = r_2\tilde{\mu}_2, \\
f_1(3) = r_2\tilde{\mu}_3 + \frac{\tilde{\mu}_3}{1-\tilde{\mu}_2} f_2(2) + F^{(1)}_{3,2}(1), & f_1(4) = r_2\tilde{\mu}_4 + \frac{\tilde{\mu}_4}{1-\tilde{\mu}_2} f_2(2) + F^{(1)}_{4,2}(1), \\
f_2(1) = r_1\tilde{\mu}_1, & f_2(2) = r_1\tilde{\mu}_2 + \frac{\tilde{\mu}_2}{1-\tilde{\mu}_1} f_1(1) + f_1(2), \\
f_2(3) = r_1\tilde{\mu}_3 + \frac{\tilde{\mu}_3}{1-\tilde{\mu}_1} f_1(1) + F^{(1)}_{3,1}(1), & f_2(4) = r_1\tilde{\mu}_4 + \frac{\tilde{\mu}_4}{1-\tilde{\mu}_1} f_1(1) + F^{(1)}_{4,1}(1), \\
f_3(1) = \tilde{r}_4\tilde{\mu}_1 + \frac{\tilde{\mu}_1}{1-\tilde{\mu}_4} f_4(4) + F^{(1)}_{1,4}(1), & f_3(2) = \tilde{r}_4\tilde{\mu}_2 + \frac{\tilde{\mu}_2}{1-\tilde{\mu}_4} f_4(4) + F^{(1)}_{2,4}(1), \\
f_3(3) = \tilde{r}_4\tilde{\mu}_3 + \frac{\tilde{\mu}_3}{1-\tilde{\mu}_4} f_4(4) + f_4(3), & f_3(4) = \tilde{r}_4\tilde{\mu}_4 \\
f_4(1) = \tilde{r}_3\tilde{\mu}_1 + \frac{\tilde{\mu}_1}{1-\tilde{\mu}_3} f_3(3) + F^{(1)}_{1,3}(1), & f_4(2) = \tilde{r}_3\mu_2 + \frac{\tilde{\mu}_2}{1-\tilde{\mu}_3} f_3(3) + F^{(1)}_{2,3}(1), \\
f_4(3) = \tilde{r}_3\tilde{\mu}_3, & f_4(4) = \tilde{r}_3\tilde{\mu}_4 + \frac{\tilde{\mu}_4}{1-\tilde{\mu}_3} f_3(3) + f_3(4),
\end{array}$$

Then we have that if $\mu = \tilde{\mu}_1 + \tilde{\mu}_2 < 1$, $\hat{\mu} = \tilde{\mu}_3 + \tilde{\mu}_4 < 1$, $r = r_1 + r_2$ and $\hat{r} = \tilde{r}_3 + \tilde{r}_4$ the system's solution are obtained by direct calculations:

$$\begin{array}{ll}
f_2(1) = r_1\tilde{\mu}_1, & f_1(2) = r_2\tilde{\mu}_2, \\
f_3(4) = r_4\tilde{\mu}_4, & f_4(3) = r_3\tilde{\mu}_3, \\
f_1(1) = r\frac{\tilde{\mu}_1(1-\tilde{\mu}_1)}{1-\mu}, & f_2(2) = r\frac{\tilde{\mu}_2(1-\tilde{\mu}_2)}{1-\mu}, \\
f_1(3) = \tilde{\mu}_3\left(r_2 + \frac{r\tilde{\mu}_2}{1-\mu}\right) + F^{(1)}_{3,2}(1), & f_1(4) = \tilde{\mu}_4\left(r_2 + \frac{r\tilde{\mu}_2}{1-\mu}\right) + F^{(1)}_{4,2}(1), \\
f_2(3) = \tilde{\mu}_3\left(r_1 + \frac{r\tilde{\mu}_1}{1-\tilde{\mu}}\right) + F^{(1)}_{3,1}(1), & f_2(4) = \tilde{\mu}_4\left(r_1 + \frac{r\tilde{\mu}_1}{1-\mu}\right) + F^{(1)}_{4,,1}(1), \\
f_3(1) = \tilde{\mu}_1\left(r_4 + \frac{\hat{r}\tilde{\mu}_4}{1-\hat{\mu}}\right) + F^{(1)}_{1,4}(1), & f_3(2) = \tilde{\mu}_2\left(r_4 + \frac{\hat{r}\tilde{\mu}_4}{1-\hat{\mu}}\right) + F^{(1)}_{2,4}(1), \\
f_3(3) = \hat{r}\frac{\tilde{\mu}_3(1-\tilde{\mu}_3)}{1-\hat{\mu}}, & f_4(1) = \tilde{\mu}_1\left(r_3 + \frac{\hat{r}\tilde{\mu}_3}{1-\hat{\mu}}\right) + F^{(1)}_{1,3}(1), \\
f_4(2) = \tilde{\mu}_2\left(r_3 + \frac{\hat{r}\tilde{\mu}_3}{1-\hat{\mu}}\right) + F^{(1)}_{2,3}(1), & f_4(4) = \hat{r}\frac{\tilde{\mu}_4(1-\tilde{\mu}_4)}{1-\hat{\mu}}.
\end{array}$$

Now, developing the equations given in (37.4.10) we obtain for instance $f_1(1,1) = \left(\frac{\tilde{\mu}_1}{1-\tilde{\mu}_2}\right)^2 f_2(2,2) + 2\frac{\tilde{\mu}_1}{1-\tilde{\mu}_2} f_2(2,1) + f_2(1,1) + \tilde{\mu}_1^2\left(R_2^{(2)} + f_2(2)\theta_2^{(2)}\right) + \tilde{P}_1^{(2)}\left(\frac{f_2(2)}{1-\tilde{\mu}_2} + r_2\right) + 2r_2\tilde{\mu}_2 f_2(1)$; similar reasoning lead us the following general expressions

$$\begin{aligned}
f_1(i,j) = {} & \mathbb{1}_{i=1} f_2(1,1) + \Big[(1-\mathbb{1}_{i=j=3})\,\mathbb{1}_{i+j\leq 6}\mathbb{1}_{i\leq j}\frac{\mu_j}{1-\tilde{\mu}_2} + (1-\mathbb{1}_{i=j=3})\,\mathbb{1}_{i+j\leq 6}\mathbb{1}_{i>j}\frac{\mu_i}{1-\tilde{\mu}_2} \\
& + \mathbb{1}_{i=1}\frac{\mu_i}{1-\tilde{\mu}_2}\Big] f_2(1,2) + \mathbb{1}_{i,j\neq 2}\left(\frac{1}{1-\tilde{\mu}_2}\right)^2 \mu_i\mu_j f_2(2,2) + \Big[\mathbb{1}_{i,j\neq 2}\tilde{\theta}_2^{(2)}\tilde{\mu}_i\tilde{\mu}_j + \mathbb{1}_{i,j\neq 2}\mathbb{1}_{i=j}\frac{\tilde{P}_i^{(2)}}{1-\tilde{\mu}_2} \\
& + \mathbb{1}_{i,j\neq 2}\mathbb{1}_{i\neq j}\frac{\tilde{\mu}_i\tilde{\mu}_j}{1-\tilde{\mu}_2}\Big] f_2(2) + \left[r_2\tilde{\mu}_i + \mathbb{1}_{i\geq 3}F^{(1)}_{i,2}\right] f_2(j) + \left[r_2\tilde{\mu}_j + \mathbb{1}_{j\geq 3}F^{(1)}_{j,2}\right] f_2(i) \\
& + \left[R_2^{(2)} + \mathbb{1}_{i=j}r_2\right]\tilde{\mu}_i\mu_j + \mathbb{1}_{j\geq 3}F^{(1)}_{j,2}\left[\mathbb{1}_{j\neq i}F^{(1)}_{i,2} + r_2\tilde{\mu}_i\right] + r_2\left[\mathbb{1}_{i=j}P_i^{(2)} + \mathbb{1}_{i\geq 3}F^{(1)}_{i,2}\tilde{\mu}_j\right] \\
& + \mathbb{1}_{i\geq 3}\mathbb{1}_{j=i}F^{(2)}_{i,2}
\end{aligned} \tag{37.5.1}$$

in a similar manner we obtain expressions for $f_2(i,j)$, $f_3(i,j)$ and $f_4(i,j)$

for $i,k = 1,2,3,4$; from which we obtain the linear equations system

$$\begin{array}{ll}
f_1(1,1) = a_1 f_2(2,2) + a_2 f_2(2,1) + a_3 f_2(1,1) + K_1, & f_1(1,2) = K_2, \\
f_1(1,3) = a_4 f_2(2,2) + a_5 f(2,1) + K_3, & f_1(1,4) = a_6 f_2(2,2) + a_7 f_2(2,1) + K_4,
\end{array} \tag{37.5.2}$$

for the rest equations, similar reasoning lead us to a linear system equations whose solutions are described in corolary (37.4.1) with coefficients given by, we just show a few of them

with values for a_i and K_i

$$\begin{array}{llll}
a_1 = \left(\frac{\tilde{\mu}_1}{1-\tilde{\mu}_2}\right)^2, & a_2 = \frac{2\tilde{\mu}_1}{1-\tilde{\mu}_2}, & a_3 = 1, & a_4 = \left(\frac{1}{1-\tilde{\mu}_2}\right)^2\tilde{\mu}_1\tilde{\mu}_3, \\
a_5 = \frac{\tilde{\mu}_3}{1-\tilde{\mu}_2}, & a_6 = \left(\frac{1}{1-\tilde{\mu}_2}\right)^2\tilde{\mu}_1\tilde{\mu}_4, & a_7 = \frac{\tilde{\mu}_4}{1-\tilde{\mu}_2}, &
\end{array} \tag{37.5.3}$$

$$\begin{aligned}
K_1 &= \tilde{\mu}_1^2\left(R_2^{(2)} + f_2(2)\theta_2^{(2)}\right) + \tilde{P}_1^{(2)}\left(\frac{f_2(2)}{1-\tilde{\mu}_2} + r_2\right) + 2r_2\tilde{\mu}_2 f_2(1), \\
K_2 &= \tilde{\mu}_1\tilde{\mu}_2\left[R_2^{(2)} + r_2\right] + r_2\left[\tilde{\mu}_1 f_2(2) + \tilde{\mu}_2 f_2(1)\right], \\
K_3 &= \tilde{\mu}_1\tilde{\mu}_3\left[R_2^{(2)} + r_2 + f_2(2)\left(\tilde{\theta}_2^{(2)} + \frac{1}{1-\tilde{\mu}_2}\right)\right] + r_2\tilde{\mu}_1\left[F^{(1)}_{3,2} + f_2(1)\right] + \left[r_2\tilde{\mu}_3 + F^{(1)}_{3,2}\right] f_2(1), \\
K_4 &= \tilde{\mu}_1\tilde{\mu}_4\left[R_2^{(2)} + r_2 + f_2(2)\left(\tilde{\theta}_2^{(2)} + \frac{1}{1-\tilde{\mu}_2}\right)\right] + r_2\tilde{\mu}_1\left[f_2(4) + F^{(1)}_{4,2}\right] + f_2(1)\left[r_2\tilde{\mu}_4 + F^{(1)}_{4,2}\right],
\end{aligned} \tag{37.5.4}$$

37.6. Appendix B: Stability Analysis for a NCPS

Teorema 37.6.1 *Dada una Red de Sistemas de Visitas Cíclicas (RSVC), conformada por dos Sistemas de Visitas Cíclicas (SVC), donde cada uno de ellos consta de dos colas tipo $M/M/1$. Los dos sistemas están comunicados entre sí por medio de la transferencia de usuarios entre las colas $Q_1 \leftrightarrow Q_3$ y $Q_2 \leftrightarrow Q_4$. Se definen los eventos para los procesos de arribos al tiempo t, $A_j(t) = \{0$ arribos en Q_j al tiempo $t\}$ para algún tiempo $t \geq 0$ y Q_j la cola j-ésima en la RSVC, para $j = 1, 2, 3, 4$. Existe un intervalo $I \neq \emptyset$ tal que para $T^* \in I$, tal que $\mathbb{P}\{A_1(T^*), A_2(Tt^*), A_3(T^*), A_4(T^*) | T^* \in I\} > 0$.*

Demostración 37.6.1 *Sin pérdida de generalidad podemos considerar como base del análisis a la cola Q_1 del primer sistema que conforma la RSVC.*

Sea $n \geq 1$, ciclo en el primer sistema en el que se sabe que $L_j(\overline{\tau}_1(n)) = 0$, pues la política de servicio con que atienden los servidores es la exhaustiva. Como es sabido, para trasladarse a la siguiente cola, el servidor incurre en un tiempo de traslado $r_1(n) > 0$, entonces tenemos que $\tau_2(n) = \overline{\tau}_1(n) + r_1(n)$.

Definamos el intervalo $I_1 \equiv [\overline{\tau}_1(n), \tau_2(n)]$ de longitud $\xi_1 = r_1(n)$.

Dado que los tiempos entre arribo son exponenciales con tasa $\tilde{\mu}_1 = \mu_1 + \hat{\mu}_1$ (μ_1 son los arribos a Q_1 por primera vez al sistema, mientras que $\hat{\mu}_1$ son los arribos de traslado procedentes de Q_3) se tiene que la probabilidad del evento $A_1(t)$ está dada por

$$\mathbb{P}\{A_1(t) | t \in I_1(n)\} = e^{-\tilde{\mu}_1 \xi_1(n)}. \tag{37.6.1}$$

Por otra parte, para la cola Q_2 el tiempo $\overline{\tau}_2(n-1)$ es tal que $L_2(\overline{\tau}_2(n-1)) = 0$, es decir, es el tiempo en que la cola queda totalmente vacía en el ciclo anterior a n.

Entonces tenemos un sgundo intervalo $I_2 \equiv [\overline{\tau}_2(n-1), \tau_2(n)]$. Por lo tanto la probabilidad del evento $A_2(t)$ tiene probabilidad dada por

$$\mathbb{P}\{A_2(t) | t \in I_2(n)\} = e^{-\tilde{\mu}_2 \xi_2(n)}, \tag{37.6.2}$$

$$\xi_2(n) = \tau_2(n) - \overline{\tau}_2(n-1) \tag{37.6.3}$$

Ahora, dado que $I_1(n) \subset I_2(n)$, se tiene que

$$\begin{aligned} \xi_1(n) \leq \xi_2(n) &\Leftrightarrow -\xi_1(n) \geq -\xi_2(n) \\ -\tilde{\mu}_2 \xi_1(n) \geq -\tilde{\mu}_2 \xi_2(n) &\Leftrightarrow e^{-\tilde{\mu}_2 \xi_1(n)} \geq e^{-\tilde{\mu}_2 \xi_2(n)} \\ \mathbb{P}\{A_2(t) | t \in I_1(n)\} &\geq \mathbb{P}\{A_2(t) | t \in I_2(n)\}. \end{aligned}$$

Entonces se tiene que

$$\begin{aligned} \mathbb{P}\{A_1(t), A_2(t) | t \in I_1(n)\} &= \mathbb{P}\{A_1(t) | t \in I_1(n)\} \mathbb{P}\{A_2(t) | t \in I_1(n)\} \\ &\geq \mathbb{P}\{A_1(t) | t \in I_1(n)\} \mathbb{P}\{A_2(t) | t \in I_2(n)\} \\ &= e^{-\tilde{\mu}_1 \xi_1(n)} e^{-\tilde{\mu}_2 \xi_2(n)} = e^{-[\tilde{\mu}_1 \xi_1(n) + \tilde{\mu}_2 \xi_2(n)]}. \end{aligned}$$

Es decir,

$$\mathbb{P}\{A_1(t), A_2(t) | t \in I_1(n)\} = e^{-[\tilde{\mu}_1 \xi_1(n) + \tilde{\mu}_2 \xi_2(n)]} > 0. \tag{37.6.4}$$

En lo que respecta a la relación entre los dos SVC que conforman la RSVC para algún $m \geq 1$ se tiene que $\tau_3(m) < \tau_2(n) < \tau_4(m)$ por lo tanto se cumple cualquiera de los siguientes cuatro casos

a) $\tau_3(m) < \tau_2(n) < \overline{\tau}_3(m)$

b) $\overline{\tau}_3(m) < \tau_2(n) < \tau_4(m)$

c) $\tau_4(m) < \tau_2(n) < \overline{\tau}_4(m)$

d) $\overline{\tau}_4(m) < \tau_2(n) < \tau_3(m+1)$

Sea el intervalo $I_3(m) \equiv [\tau_3(m), \overline{\tau}_3(m)]$ *tal que* $\tau_2(n) \in I_3(m)$*, con longitud de intervalo* $\xi_3 \equiv \overline{\tau}_3(m) - \tau_3(m)$*, entonces se tiene que para* Q_3

$$\mathbb{P}\{A_3(t) | t \in I_3(m)\} = e^{-\tilde{\mu}_3 \xi_3(m)}. \tag{37.6.5}$$

mientras que para Q_4 *consideremos el intervalo* $I_4(m) \equiv [\tau_4(m-1), \overline{\tau}_3(m)]$*, entonces por construcción* $I_3(m) \subset I_4(m)$*, por lo tanto*

$$\begin{aligned} \xi_3(m) \leq \xi_4(m) &\Leftrightarrow -\xi_3(m) \geq -\xi_4(m) \\ -\tilde{\mu}_4 \xi_3(m) \geq -\tilde{\mu}_4 \xi_4(m) &\Leftrightarrow e^{-\tilde{\mu}_4 \xi_3(m)} \geq e^{-\tilde{\mu}_4 \xi_4(n)} \\ \mathbb{P}\{A_4(t) | t \in I_3(m)\} &\geq \mathbb{P}\{A_4(t) | t \in I_4(m)\}. \end{aligned}$$

Entonces se tiene que

$$\begin{aligned} \mathbb{P}\{A_3(t), A_4(t) | t \in I_3(m)\} &= \mathbb{P}\{A_3(t) | t \in I_3(m)\} \mathbb{P}\{A_4(t) | t \in I_3(m)\} \\ &\geq \mathbb{P}\{A_3(t) | t \in I_3(m)\} \mathbb{P}\{A_4(t) | t \in I_4(m)\} \\ &= e^{-\tilde{\mu}_3 \xi_3(m)} e^{-\tilde{\mu}_4 \xi_4(m)} = e^{-(\tilde{\mu}_3 \xi_3(m) + \tilde{\mu}_4 \xi_4(m))}. \end{aligned}$$

Es decir,

$$\mathbb{P}\{A_3(t), A_4(t) | t \in I_3(m)\} \geq e^{-(\tilde{\mu}_3 \xi_3(m) + \tilde{\mu}_4 \xi_4(m))} > 0. \tag{37.6.6}$$

Sea el intervalo $I_3(m) \equiv [\overline{\tau}_3(m), \tau_4(m)]$ *con longitud* $\xi_3 \equiv \tau_4(m) - \overline{\tau}_3(m)$*, entonces se tiene que para* Q_3

$$\mathbb{P}\{A_3(t) | t \in I_3(m)\} = e^{-\tilde{\mu}_3 \xi_3(m)}. \tag{37.6.7}$$

mientras que para Q_4 *consideremos el intervalo* $I_4(m) \equiv [\overline{\tau}_4(m-1), \tau_4(m)]$*, entonces por construcción* $I_3(m) \subset I_4(m)$*, y al igual que en el caso anterior se tiene que*

$$\begin{aligned} \xi_3(m) \leq \xi_4(m) &\Leftrightarrow -\xi_3(m) \geq -\xi_4(m) \\ -\tilde{\mu}_4 \xi_3(m) \geq -\tilde{\mu}_4 \xi_4(m) &\Leftrightarrow e^{-\tilde{\mu}_4 \xi_3(m)} \geq e^{-\tilde{\mu}_4 \xi_4(n)} \\ \mathbb{P}\{A_4(t) | t \in I_3(m)\} &\geq \mathbb{P}\{A_4(t) | t \in I_4(m)\}. \end{aligned}$$

Entonces se tiene que

$$\begin{aligned} \mathbb{P}\{A_3(t), A_4(t) | t \in I_3(m)\} &= \mathbb{P}\{A_3(t) | t \in I_3(m)\} \mathbb{P}\{A_4(t) | t \in I_3(m)\} \\ &\geq \mathbb{P}\{A_3(t) | t \in I_3(m)\} \mathbb{P}\{A_4(t) | t \in I_4(m)\} \\ &= e^{-\tilde{\mu}_3 \xi_3(m)} e^{-\tilde{\mu}_4 \xi_4(m)} = e^{-(\tilde{\mu}_3 \xi_3(m) + \tilde{\mu}_4 \xi_4(m))}. \end{aligned}$$

Es decir,

$$\mathbb{P}\{A_3(t), A_4(t) | t \in I_4(m)\} \geq e^{-(\tilde{\mu}_3 + \tilde{\mu}_4) \xi_3(m)} > 0. \tag{37.6.8}$$

Para el intervalo $I_3(m) = [\tau_4(m), \overline{\tau}_4(m)]$*, se tiene que este caso es análogo al caso (a).*

Para el intevalo $I_3(m) \equiv [\overline{\tau}_4(m), \tau_4(m+1)]$*, se tiene que es análogo al caso (b).*

Por construcción se tiene que $I(n,m) \equiv I_1(n) \cap I_3(m) \neq \emptyset$*,entonces en particular se tienen las contenciones* $I(n,m) \subseteq I_1(n)$ *y* $I(n,m) \subseteq I_3(m)$*, por lo tanto si definimos* $\xi_{n,m} \equiv \ell(I(n,m))$ *tenemos que*

$$\begin{gathered} \xi_{n,m} \leq \xi_1(n) \ \ y \ \xi_{n,m} \leq \xi_3(m) \ \ entonces \\ -\xi_{n,m} \geq -\xi_1(n) \ \ y \ -\xi_{n,m} \leq -\xi_3(m) \end{gathered}$$

por lo tanto tenemos las desigualdades

$$\begin{array}{ll} -\tilde{\mu}_1\xi_{n,m} \geq -\tilde{\mu}_1\xi_1(n), & -\tilde{\mu}_2\xi_{n,m} \geq -\tilde{\mu}_2\xi_1(n) \geq -\tilde{\mu}_2\xi_2(n), \\ -\tilde{\mu}_3\xi_{n,m} \geq -\tilde{\mu}_3\xi_3(m), & -\tilde{\mu}_4\xi_{n,m} \geq -\tilde{\mu}_4\xi_3(m) \geq -\tilde{\mu}_4\xi_4(m). \end{array}$$

Sea $T^* \in I(n,m)$, entonces dado que en particular $T^* \in I_1(n)$, se cumple con probabilidad positiva que no hay arribos a las colas Q_1 y Q_2, en consecuencia, tampoco hay usuarios de transferencia para Q_3 y Q_4, es decir, $\tilde{\mu}_1 = \mu_1$, $\tilde{\mu}_2 = \mu_2$, $\tilde{\mu}_3 = \mu_3$, $\tilde{\mu}_4 = \mu_4$, es decir, los eventos Q_1 y Q_3 son condicionalmente independientes en el intervalo $I(n,m)$; lo mismo ocurre para las colas Q_2 y Q_4, por lo tanto tenemos que

$$\begin{array}{l} \mathbb{P}\{A_1(T^*), A_2(T^*), A_3(T^*), A_4(T^*) | T^* \in I(n,m)\} \\ = \prod_{j=1}^{4} \mathbb{P}\{A_j(T^*) | T^* \in I(n,m)\} \\ \geq \mathbb{P}\{A_1(T^*) | T^* \in I_1(n)\} \mathbb{P}\{A_2(T^*) | T^* \in I_2(n)\} \\ \mathbb{P}\{A_3(T^*) | T^* \in I_3(m)\} \mathbb{P}\{A_4(T^*) | T^* \in I_4(m)\} \\ = e^{-\mu_1\xi_1(n)} e^{-\mu_2\xi_2(n)} e^{-\mu_3\xi_3(m)} e^{-\mu_4\xi_4(m)} \\ = e^{-[\tilde{\mu}_1\xi_1(n)+\tilde{\mu}_2\xi_2(n)+\tilde{\mu}_3\xi_3(m)+\tilde{\mu}_4\xi_4(m)]} > 0. \end{array} \tag{37.6.9}$$

Ahora solo resta demostrar que para $n \geq 1$, existe $m \geq 1$ tal que se cumplen cualquiera de los cuatro casos arriba mencionados:

a) $\tau_3(m) < \tau_2(n) < \overline{\tau}_3(m)$

b) $\overline{\tau}_3(m) < \tau_2(n) < \tau_4(m)$

c) $\tau_4(m) < \tau_2(n) < \overline{\tau}_4(m)$

d) $\overline{\tau}_4(m) < \tau_2(n) < \tau_3(m+1)$

Consideremos nuevamente el primer caso. Supongamos que no existe $m \geq 1$, tal que $I_1(n) \cap I_3(m) \neq \emptyset$, es decir, para toda $m \geq 1$, $I_1(n) \cap I_3(m) = \emptyset$, entonces se tiene que ocurren cualquiera de los dos casos

a) $\tau_2(n) \leq \tau_3(m)$*: Recordemos que $\tau_2(m) = \overline{\tau}_1 + r_1(m)$ donde cada una de las variables aleatorias son tales que $\mathbb{E}[\overline{\tau}_1(n) - \tau_1(n)] < \infty$, $\mathbb{E}[R_1] < \infty$ y $\mathbb{E}[\tau_3(m)] < \infty$, lo cual contradice el hecho de que no exista un ciclo $m \geq 1$ que satisfaga la condición deseada.*

b) $\tau_2(n) \geq \overline{\tau}_3(m)$*: por un argumento similar al anterior se tiene que no es posible que no exista un ciclo $m \geq 1$ tal que satisaface la condición deseada.*

Para el resto de los casos la demostración es análoga. Por lo tanto, se tiene que efectivamente existe $m \geq 1$ tal que $\tau_3(m) < \tau_2(n) < \tau_4(m)$.

37.7. Appendix C: Output Process and Regenerative Processes

En Sigman, Thorison y Wolff [40] prueban que para la existencia de un una sucesión infinita no decreciente de tiempos de regeneración $\tau_1 \leq \tau_2 \leq \cdots$ en los cuales el proceso se regenera, basta un tiempo de regeneración R_1, donde $R_j = \tau_j - \tau_{j-1}$. Para tal efecto se requiere la existencia de un espacio de probabilidad $(\Omega, \mathcal{F}, \mathbb{P})$, y proceso estocástico $X = \{X(t) : t \geq 0\}$ con espacio de estados $(S, \mathcal{R})$, con $\mathcal{R}$ σ-álgebra.

Proposición 37.7.1 *Si existe una variable aleatoria no negativa R_1 tal que $\theta_{R1} X =_D X$, entonces $(\Omega, \mathcal{F}, \mathbb{P})$ puede extenderse para soportar una sucesión estacionaria de variables aleatorias $R = \{R_k : k \geq 1\}$, tal que para $k \geq 1$,*

$$\theta_k (X, R) =_D (X, R).$$

Además, para $k \geq 1$, $\theta_k R$ es condicionalmente independiente de $(X, R_1, \ldots, R_k)$, dado $\theta_{\tau k} X$.

- Doob en 1953 demostró que el estado estacionario de un proceso de partida en un sistema de espera $M/G/\infty$, es Poisson con la misma tasa que el proceso de arribos.
- Burke en 1968, fue el primero en demostrar que el estado estacionario de un proceso de salida de una cola $M/M/s$ es un proceso Poisson.
- Disney en 1973 obtuvo el siguiente resultado:

  Teorema 37.7.1 *Para el sistema de espera $M/G/1/L$ con disciplina FIFO, el proceso $\boldsymbol{I}$ es un proceso de renovación si y sólo si el proceso denominado longitud de la cola es estacionario y se cumple cualquiera de los siguientes casos:*

  a) Los tiempos de servicio son identicamente cero;
  b) $L = 0$, para cualquier proceso de servicio S;
  c) $L = 1$ y $G = D$;
  d) $L = \infty$ y $G = M$.

  En estos casos, respectivamente, las distribuciones de interpartida $P\{T_{n+1} - T_n \leq t\}$ son

  a) $1 - e^{-\lambda t}$, $t \geq 0$;
  b) $1 - e^{-\lambda t} * F(t)$, $t \geq 0$;
  c) $1 - e^{-\lambda t} * \mathbb{1}_d(t)$, $t \geq 0$;
  d) $1 - e^{-\lambda t} * F(t)$, $t \geq 0$.

- Finch (1959) mostró que para los sistemas $M/G/1/L$, con $1 \leq L \leq \infty$ con distribuciones de servicio dos veces diferenciable, solamente el sistema $M/M/1/\infty$ tiene proceso de salida de renovación estacionario.
- King (1971) demostro que un sistema de colas estacionario $M/G/1/1$ tiene sus tiempos de interpartida sucesivas D_n y D_{n+1} son independientes, si y sólo si, $G = D$, en cuyo caso le proceso de salida es de renovación.
- Disney (1973) demostró que el único sistema estacionario $M/G/1/L$, que tiene proceso de salida de renovación son los sistemas $M/M/1$ y $M/D/1/1$.
- El siguiente resultado es de Disney y Koning (1985)

  Teorema 37.7.2 *En un sistema de espera $M/G/s$, el estado estacionario del proceso de salida es un proceso Poisson para cualquier distribución de los tiempos de servicio si el sistema tiene cualquiera de las siguientes cuatro propiedades.*

  a) $s = \infty$
  b) La disciplina de servicio es de procesador compartido.
  c) La disciplina de servicio es LCFS y preemptive resume, esto se cumple para $L < \infty$
  d) $G = M$.

- El siguiente resultado es de Alamatsaz (1983)

  Teorema 37.7.3 *En cualquier sistema de colas $GI/G/1/L$ con $1 \leq L < \infty$ y distribución de interarribos A y distribución de los tiempos de servicio B, tal que $A(0) = 0$, $A(t)(1 - B(t)) > 0$ para alguna $t > 0$ y $B(t)$ para toda $t > 0$, es imposible que el proceso de salida estacionario sea de renovación.*

Definición 37.7.1 (Definición Clásica) *Un proceso estocástico $X = \{X(t) : t \geq 0\}$ es llamado regenerativo is existe una variable aleatoria $R_1 > 0$ tal que*

i) $\{X(t + R_1) : t \geq 0\}$ es independiente de $\{\{X(t) : t < R_1\}, \}$
ii) $\{X(t + R_1) : t \geq 0\}$ es estocásticamente equivalente a $\{X(t) : t > 0\}$

Llamamos a R_1 tiempo de regeneración, y decimos que X se regenera en este punto.

$\{X(t+R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Nota 37.7.1 *La existencia de un primer tiempo de regeneración, R_1, implica la existencia de una sucesión completa de estos tiempos $R_1, R_2 \ldots$, que satisfacen la propiedad deseada [40].*

Nota 37.7.2 *Para la cola $GI/GI/1$ los usuarios arriban con tiempos t_n y son atendidos con tiempos de servicio S_n, los tiempos de arribo forman un proceso de renovación con tiempos entre arribos independientes e identicamente distribuidos (`i.i.d.`)$T_n = t_n - t_{n-1}$, además los tiempos de servicio son `i.i.d.` e independientes de los procesos de arribo. Por estable se entiende que $\mathbb{E}S_n < \mathbb{E}T_n < \infty$.*

Definición 37.7.2 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty X(u)\,du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty I_x(u)\,du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\,dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.7.3 *Funciones de procesos regenerativos son regenerativas, es decir, si $X(t)$ es regenerativo y se define el proceso $Y(t)$ por $Y(t) = f(X(t))$ para alguna función Borel medible $f(\cdot)$. Además Y es regenerativo con los mismos tiempos de renovación que X.*

En general, los tiempos de renovación, Z_k de un proceso regenerativo no requieren ser tiempos de paro con respecto a la evolución de $X(t)$.

Nota 37.7.4 *Una función de un proceso de Markov, usualmente no será un proceso de Markov, sin embargo será regenerativo si el proceso de Markov lo es.*

Nota 37.7.5 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Nota 37.7.6
a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.

b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\{V(t-s) \in A | X_1 > t-s\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones (*puntos de regeneración*) que ocurren en $[0,t]$. El intervalo $[0, X_1)$ es llamado *primer ciclo de regeneración* de $\{V(t), t \geq 0\}$, $[X_1, X_1 + X_2)$ el *segundo ciclo de regeneración*, y así sucesivamente.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 37.7.3 *Se define el proceso estacionario, $\{V^*(t), t \geq 0\}$, para $\{V(t), t \geq 0\}$ por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]}\int_0^\infty \mathbb{P}\{V(t+x) \in A | X > x\}(1 - F(x))\,dx,$$

para todo $t \geq 0$ y todo conjunto de Borel A.

Definición 37.7.4 *Una distribución se dice que es* aritmética *si todos sus puntos de incremento son múltiplos de la forma* $0, \lambda, 2\lambda, \ldots$ *para alguna* $\lambda > 0$ *entera.*

Definición 37.7.5 *Una modificación medible de un proceso* $\{V(t), t \geq 0\}$*, es una versión de este,* $\{V(t,w)\}$ *conjuntamente medible para* $t \geq 0$ *y para* $w \in S$*,* S *espacio de estados para* $\{V(t), t \geq 0\}$*.*

Teorema 37.7.4 *Sea* $\{V(t), t \geq\}$ *un proceso regenerativo no negativo con modificación medible. Sea* $\mathbb{E}[X] < \infty$*. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de* t*, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$*, equivalentemente, si* $\mathbb{E}\left[\int_0^X V(s)\,ds\right] < \infty$*,entonces*

$$\frac{\int_0^t V(s)\,ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$*.*

Corolario 37.7.1 *Sea* $\{V(t), t \geq 0\}$ *un proceso regenerativo no negativo, con modificación medible. Si* $\mathbb{E} < \infty$*,* F *es no-aritmética, y para todo* $x \geq 0$*,* $P\{V(t) \leq x, C > x\}$ *es de variación acotada como función de* t *en cada intervalo finito* $[0, \tau]$*, entonces* $V(t)$ *converge en distribución cuando* $t \to \infty$ *y*

$$\mathbb{E}V = \frac{\mathbb{E}\int_0^X V(s)\,ds}{\mathbb{E}X}$$

Donde V *tiene la distribución límite de* $V(t)$ *cuando* $t \to \infty$*.*

Para el caso discreto se tienen resultados similares.

Definición 37.7.6 *Sean* $0 \leq T_1 \leq T_2 \leq \ldots$ *son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos* T_n *en el intervalo* $[0, t)$ *es*

$$N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t), \tag{37.7.1}$$

para $t \geq 0$*.*

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.7.7 *Un proceso puntual* $N(t)$ *es un proceso de renovación si los tiempos de interocurrencia* $\xi_n = T_n - T_{n-1}$*, para* $n \geq 1$*, son independientes e identicamente distribuidos con distribución* F*, donde* $F(0) = 0$ *y* $T_0 = 0$*. Los* T_n *son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los* ξ_n *son los tiempos de inter-renovación, y* $N(t)$ *es el número de renovaciones en el intervalo* $[0, t)$

Nota 37.7.7 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución* F*, con* $F(0) = 0$*, para los tiempos de inter-renovación. La función* F *en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias* $\xi_1, \xi_2, \ldots$ *definidas en este con distribución* F*. Entonces las otras cantidades son* $T_n = \sum_{k=1}^{n} \xi_k$ *y* $N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t)$*, donde* $T_n \to \infty$ *casi seguramente por la Ley Fuerte de los Grandes NÃºmeros.*

Nota 37.7.8 *Una función* $h : \mathbb{R}_+ \to \mathbb{R}$ *es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ *es decreciente y Riemann Integrable.*

b) h *es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y* $|h(t)| \leq b(t)$*, donde* b *es DRI.*

Teorema 37.7.5 (Teorema Principal de Renovación) *Si* F *es no aritmética y* $h(t)$ *es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty} U \star h = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds.$$

Proposición 37.7.2 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t<0$ puede expresarse como*

$$H(t) = U \star h(t), \text{ donde } h(t) = H(t) - F \star H(t)$$

Definición 37.7.8 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}[X(T+t)|T] = \mathbb{E}[X(t)], \text{ para } t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.7.3 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}[X(t)] = U \star h(t), \text{ donde } h(t) = \mathbb{E}[X(t)\mathbb{1}(T>t)].$$

Teorema 37.7.6 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M = \sup\{|X(t)| : t \leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}[X(t)] = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds,$$

donde $h(t) = \mathbb{E}[X(t)\mathbb{1}(T>t)]$.

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq \quad t &< T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.7.4 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Nota 37.7.9 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.7.7 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1}T_n = \mu, \text{ c.s.} \tag{37.7.2}$$

$$lim_{t\to\infty} t^{-1}N(t) = 1/\mu, \text{ c.s.} \tag{37.7.3}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.7.2 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1}N(t) \to 1/\mu, \text{ c.s. cuando } t \to \infty. \tag{37.7.4}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.7.9 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.7.8 *Supóngase que $n^{-1}T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1}Z(T_n) = a, \text{ c.s.} \tag{37.7.5}$$

$$lim_{t\to\infty} t^{-1}Z(t) = a/\mu, \text{ c.s.} \tag{37.7.6}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1}M_n = 0$ c.s.

Corolario 37.7.3 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1}Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \text{ c.s. cuando } t \to \infty. \tag{37.7.7}$$

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq &\ t < T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$t^{-1}N(t) \to 1/\mu, \text{ c.s. cuando } t \to \infty. \tag{37.7.22}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.7.12 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.7.14 *Supóngase que $n^{-1}T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1}Z(T_n) = a, \text{ c.s.} \tag{37.7.23}$$

$$lim_{t\to\infty} t^{-1}Z(t) = a/\mu, \text{ c.s.} \tag{37.7.24}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1}M_n = 0$ c.s.

Corolario 37.7.9 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1}Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \text{ c.s. cuando } t \to \infty. \tag{37.7.25}$$

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq &\ t < T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.7.8 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Nota 37.7.13 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.7.15 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1}T_n = \mu, \text{ c.s.} \tag{37.7.26}$$

$$lim_{t\to\infty} t^{-1}N(t) = 1/\mu, \text{ c.s.} \tag{37.7.27}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.7.10 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1}N(t) \to 1/\mu, \text{ c.s. cuando } t \to \infty. \tag{37.7.28}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.7.13 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.7.16 *Supóngase que $n^{-1}T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1}Z(T_n) = a, \text{ c.s.} \tag{37.7.29}$$

$$lim_{t\to\infty} t^{-1}Z(t) = a/\mu, \text{ c.s.} \tag{37.7.30}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1}M_n = 0$ c.s.

Corolario 37.7.11 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1}Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \text{ c.s. cuando } t \to \infty. \tag{37.7.31}$$

Definición 37.7.14 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t < 0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t) = h(t) + \int_{[0,t]} H(t-s)\, dF(s), \; t \geq 0, \tag{37.7.32}$$

donde $H(t)$ es una función de valores reales. Esto es $H = h + F \star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t < 0$.

Proposición 37.7.9 *La función $U \star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.7.17 (Teorema Renovación Elemental)

$$t^{-1}U(t) \to 1/\mu, \text{ cuando } t \to \infty.$$

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.7.15 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t) = \sum_{n=1}^{\infty} F^{n\star}(t), \; t \geq 0,$$

donde $F^{0\star}(t) = \mathbb{1}(t \geq 0)$.

Proposición 37.7.10 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t > 0$, y es $U'(t) = \sum_{n=0}^{\infty} f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t) > N(t-)\} = 0, \; t \geq 0.$$

Definición 37.7.16 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha) = \int_{\mathbb{R}_+} e^{-\alpha t} dF(t), \; \alpha \geq 0.$$

Entonces

$$\hat{U}(\alpha) = \sum_{n=0}^{\infty} F^{\hat{n}\star}(\alpha) = \sum_{n=0}^{\infty} \hat{F}(\alpha)^n = \frac{1}{1 - \hat{F}(\alpha)}.$$

Proposición 37.7.11 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha) = \frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.7.14 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)] = \lambda t$, para $t \geq 0$.*

Teorema 37.7.18 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t) = \mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f : \mathbb{R}_+ \to \mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()} f(T_n)\right] = \int_{(0,t]} f(s)\, d\eta(s)\,,\ t \geq 0,$$

suponiendo que la integral exista. Además si $X_1, X_2, \ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n | T_n = s] = f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)} X_n\right] = \int_{(0,t]} f(s)\, d\eta(s)\,,\ t \geq 0,$$

suponiendo que la integral exista.

Corolario 37.7.12 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right] = \mu \mathbb{E}[N(t)+1]\,,\ t \geq 0,$$

Definición 37.7.17 *Sean $0 \leq T_1 \leq T_2 \leq \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0,t)$ es*

$$N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t)\,, \tag{37.7.33}$$

para $t \geq 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.7.18 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \geq 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0,t)$*

Nota 37.7.15 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^{n} \xi_k$ y $N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes NÃºmeros.*

Definición 37.7.19 *Sean $0 \leq T_1 \leq T_2 \leq \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0,t)$ es*

$$N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t)\,, \tag{37.7.34}$$

para $t \geq 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.7.20 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \geq 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0,t)$*

Nota 37.7.16 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^{n} \xi_k$ y $N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes Números.*

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq &\quad t \quad < T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.7.12 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Ejemplo 37.7.1 (Proceso Poisson) *Suponga que se tienen tiempos de inter-renovación i.i.d. del proceso de renovación $N(t)$ tienen distribución exponencial $F(t) = q - e^{-\lambda t}$ con tasa λ. Entonces $N(t)$ es un proceso Poisson con tasa λ.*

Nota 37.7.17 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.7.19 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{37.7.35}$$

$$lim_{t\to\infty} t^{-1} N(t) = 1/\mu, \ c.s. \tag{37.7.36}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.7.13 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1} N(t) \to 1/\mu, \ c.s. \ cuando \ t \to \infty. \tag{37.7.37}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.7.21 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.7.20 *Supóngase que $n^{-1}T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \ c.s. \tag{37.7.38}$$

$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \ c.s. \tag{37.7.39}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.7.14 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \ c.s. \text{ cuando } t \to \infty. \tag{37.7.40}$$

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.7.22 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t) = \sum_{n=1}^{\infty} F^{n\star}(t), \ t \geq 0,$$

donde $F^{0\star}(t) = \mathbb{1}(t \geq 0)$.

Proposición 37.7.13 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t > 0$, y es $U'(t) = \sum_{n=0}^{\infty} f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t) > N(t-)\} = 0, \ t \geq 0.$$

Definición 37.7.23 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha) = \int_{\mathbb{R}_+} e^{-\alpha t} dF(t), \ \alpha \geq 0.$$

Entonces

$$\hat{U}(\alpha) = \sum_{n=0}^{\infty} F^{\hat{n}\star}(\alpha) = \sum_{n=0}^{\infty} \hat{F}(\alpha)^n = \frac{1}{1 - \hat{F}(\alpha)}.$$

Proposición 37.7.14 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha) = \frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.7.18 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)] = \lambda t$, para $t \geq 0$.*

Teorema 37.7.21 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t) = \mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f : \mathbb{R}_+ \to \mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()} f(T_n)\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista. Además si $X_1, X_2, \ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n | T_n = s] = f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)} X_n\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista.

Corolario 37.7.15 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right] = \mu \mathbb{E}[N(t) + 1], \ t \geq 0,$$

Definición 37.7.24 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t<0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t)=h(t)+\int_{[0,t]}H(t-s)\,dF(s)\,,\ t\geq 0, \tag{37.7.41}$$

donde $H(t)$ es una función de valores reales. Esto es $H=h+F\star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t<0$.

Proposición 37.7.15 *La función $U\star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.7.22 (Teorema Renovación Elemental)

$$t^{-1}U(t)\to 1/\mu,\ \textit{cuando}\ t\to\infty.$$

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.7.25 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t)=\sum_{n=1}^{\infty}F^{n\star}(t)\,,\ t\geq 0,$$

donde $F^{0\star}(t)=\mathbb{1}(t\geq 0)$.

Proposición 37.7.16 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t>0$, y es $U^{'}(t)=\sum_{n=0}^{\infty}f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t)>N(t-)\}=0,\ t\geq 0.$$

Definición 37.7.26 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha)=\int_{\mathbb{R}_+}e^{-\alpha t}dF(t)\,,\ \alpha\geq 0.$$

Entonces

$$\hat{U}(\alpha)=\sum_{n=0}^{\infty}F^{\hat{n}\star}(\alpha)=\sum_{n=0}^{\infty}\hat{F}(\alpha)^{n}=\frac{1}{1-\hat{F}(\alpha)}.$$

Proposición 37.7.17 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha)=\frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.7.19 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)]=\lambda t$, para $t\geq 0$.*

Teorema 37.7.23 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t)=\mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f:\mathbb{R}_+\to\mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()}f(T_n)\right]=\int_{(0,t]}f(s)\,d\eta(s)\,,\ t\geq 0,$$

suponiendo que la integral exista. Además si $X_1,X_2,\ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n|T_n=s]=f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)}X_n\right]=\int_{(0,t]}f(s)\,d\eta(s)\,,\ t\geq 0,$$

suponiendo que la integral exista.

Corolario 37.7.16 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right]=\mu\mathbb{E}[N(t)+1]\,,\ t\geq 0,$$

Definición 37.7.27 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t<0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t)=h(t)+\int_{[0,t]}H(t-s)\,dF(s)\,,\ t\geq 0, \tag{37.7.42}$$

donde $H(t)$ es una función de valores reales. Esto es $H=h+F\star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t<0$.

Proposición 37.7.18 *La función $U\star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.7.24 (Teorema Renovación Elemental)

$$t^{-1}U(t)\to 1/\mu,\ cuando\ t\to\infty.$$

Nota 37.7.20 *Una función $h:\mathbb{R}_+\to\mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t)\geq 0$ es decreciente y Riemann Integrable.

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)|\leq b(t)$, donde b es DRI.

Teorema 37.7.25 (Teorema Principal de Renovación) *Si F es no aritmética y $h(t)$ es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty}U\star h=\frac{1}{\mu}\int_{\mathbb{R}_+}h(s)\,ds.$$

Proposición 37.7.19 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t<0$ puede expresarse como*

$$H(t)=U\star h(t)\,,\ donde\ h(t)=H(t)-F\star H(t)$$

Definición 37.7.28 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}\left[X(T+t)\,|T\right]=\mathbb{E}\left[X(t)\right],\ para\ t\geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.7.20 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}\left[X(t)\right]=U\star h(t)\,,\ donde\ h(t)=\mathbb{E}\left[X(t)\,\mathbb{1}(T>t)\right].$$

Teorema 37.7.26 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M=\sup\{|X(t)|:t\leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}\left[X(t)\right]=\frac{1}{\mu}\int_{\mathbb{R}_+}h(s)\,ds,$$

donde $h(t)=\mathbb{E}\left[X(t)\,\mathbb{1}(T>t)\right]$.

Nota 37.7.21 *Una función $h:\mathbb{R}_+\to\mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t)\geq 0$ es decreciente y Riemann Integrable.

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)|\leq b(t)$, donde b es DRI.

Teorema 37.7.27 (Teorema Principal de Renovación) *Si F es no aritmética y $h(t)$ es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty}U\star h=\frac{1}{\mu}\int_{\mathbb{R}_+}h(s)\,ds.$$

Proposición 37.7.21 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t<0$ puede expresarse como*

$$H(t)=U\star h(t)\,,\ donde\ h(t)=H(t)-F\star H(t)$$

Definición 37.7.29 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}\left[X(T+t)\,|T\right] = \mathbb{E}\left[X(t)\right], \text{ para } t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.7.22 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}\left[X(t)\right] = U \star h(t), \text{ donde } h(t) = \mathbb{E}\left[X(t)\,\mathbb{1}(T > t)\right].$$

Teorema 37.7.28 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M = \sup\{|X(t)| : t \leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}\left[X(t)\right] = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds,$$

donde $h(t) = \mathbb{E}\left[X(t)\,\mathbb{1}(T > t)\right]$.

Definición 37.7.30 *Para el proceso $\{(N(t), X(t)) : t \geq 0\}$, sus trayectoria muestrales en el intervalo de tiempo $[T_{n-1}, T_n)$ están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1}+t) : 0 \leq t < \xi_n\})$$

Este ζ_n es el n-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos T_n si sus segmentos ζ_n son independientes e idénticamennte distribuidos.

Nota 37.7.22 *Si $\tilde{X}(t)$ con espacio de estados $\tilde{S}$ es regenerativo sobre T_n, entonces $X(t) = f\left(\tilde{X}(t)\right)$ también es regenerativo sobre T_n, para cualquier función $f : \tilde{S} \to S$.*

Nota 37.7.23 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Nota 37.7.24 *Un proceso estocástico a tiempo continuo o discreto es regenerativo si existe un proceso de renovación tal que los segmentos del proceso entre tiempos de renovación sucesivos son i.i.d., es decir, para $\{X(t) : t \geq 0\}$ proceso estocástico a tiempo continuo con espacio de estados S, espacio métrico.*

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Definición 37.7.31 *Para el proceso $\{(N(t), X(t)) : t \geq 0\}$, sus trayectoria muestrales en el intervalo de tiempo $[T_{n-1}, T_n)$ están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1}+t) : 0 \leq t < \xi_n\})$$

Este ζ_n es el n-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos T_n si sus segmentos ζ_n son independientes e idénticamennte distribuidos.

Nota 37.7.25 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Teorema 37.7.29 (Procesos Regenerativos) *Suponga que el proceso*

Definición 37.7.32 (Renewal Process Trinity) *Para un proceso de renovación $N(t)$, los siguientes procesos proveen de información sobre los tiempos de renovación.*

- *$A(t) = t - T_{N(t)}$, el tiempo de recurrencia hacia atrás al tiempo t, que es el tiempo desde la última renovación para t.*
- *$B(t) = T_{N(t)+1} - t$, el tiempo de recurrencia hacia adelante al tiempo t, residual del tiempo de renovación, que es el tiempo para la próxima renovación después de t.*
- *$L(t) = \xi_{N(t)+1} = A(t) + B(t)$, la longitud del intervalo de renovación que contiene a t.*

Nota 37.7.26 *El proceso tridimensional $(A(t), B(t), L(t))$ es regenerativo sobre T_n, y por ende cada proceso lo es. Cada proceso $A(t)$ y $B(t)$ son procesos de MArkov a tiempo continuo con trayectorias continuas por partes en el espacio de estados $\mathbb{R}_+$. Una expresión conveniente para su distribución conjunta es, para $0 \leq x < t, y \geq 0$*

$$P\left\{A(t) > x, B(t) > y\right\} = P\left\{N(t+y) - N((t-x)) = 0\right\} \tag{37.7.43}$$

Ejemplo 37.7.2 (Tiempos de recurrencia Poisson) *Si $N(t)$ es un proceso Poisson con tasa λ, entonces de la expresión (37.8.10) se tiene que*

$$P\{A(t) > x, B(t) > y\} = e^{-\lambda(x+y)}, \quad 0 \leq x < t, y \geq 0,$$

que es la probabilidad Poisson de no renovaciones en un intervalo de longitud $x + y$.

Nota 37.7.27 *Una cadena de Markov ergódica tiene la propiedad de ser estacionaria si la distribución de su estado al tiempo 0 es su distribución estacionaria.*

Definición 37.7.33 *Un proceso estocástico a tiempo continuo $\{X(t) : t \geq 0\}$ en un espacio general es estacionario si sus distribuciones finito dimensionales son invariantes bajo cualquier traslado: para cada $0 \leq s_1 < s_2 < \cdots < s_k$ y $t \geq 0$,*

$$(X(s_1 + t), \ldots, X(s_k + t)) =_d (X(s_1), \ldots, X(s_k)).$$

Nota 37.7.28 *Un proceso de Markov es estacionario si $X(t) =_d X(0)$, $t \geq 0$.*

Considerese el proceso $N(t) = \sum_n \mathbb{1}(\tau_n \leq t)$ en $\mathbb{R}_+$, con puntos $0 < \tau_1 < \tau_2 < \cdots$.

Proposición 37.7.23 *Si N es un proceso puntual estacionario y $\mathbb{E}[N(1)] < \infty$, entonces $\mathbb{E}[N(t)] = t\mathbb{E}[N(1)]$, $t \geq 0$*

Teorema 37.7.30 *Los siguientes enunciados son equivalentes*

i) *El proceso retardado de renovación N es estacionario.*
ii) *EL proceso de tiempos de recurrencia hacia adelante $B(t)$ es estacionario.*
iii) $\mathbb{E}[N(t)] = t/\mu$,
iv) $G(t) = F_e(t) = \frac{1}{\mu}\int_0^t [1 - F(s)]\, ds$

Cuando estos enunciados son ciertos, $P\{B(t) \leq x\} = F_e(x)$, para $t, x \geq 0$.

Nota 37.7.29 *Una consecuencia del teorema anterior es que el Proceso Poisson es el único proceso sin retardo que es estacionario.*

Corolario 37.7.17 *El proceso de renovación $N(t)$ sin retardo, y cuyos tiempos de inter renonación tienen media finita, es estacionario si y sólo si es un proceso Poisson.*

Nota 37.7.30 *Si $\tilde{X}(t)$ con espacio de estados $\tilde{S}$ es regenerativo sobre T_n, entonces $X(t) = f\left(\tilde{X}(t)\right)$ también es regenerativo sobre T_n, para cualquier función $f : \tilde{S} \to S$.*

Nota 37.7.31 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Definición 37.7.34 (Definición Clásica) *Un proceso estocástico $X = \{X(t) : t \geq 0\}$ es llamado regenerativo is existe una variable aleatoria $R_1 > 0$ tal que*

i) *$\{X(t + R_1) : t \geq 0\}$ es independiente de $\{\{X(t) : t < R_1\},\}$*
ii) *$\{X(t + R_1) : t \geq 0\}$ es estocásticamente equivalente a $\{X(t) : t > 0\}$*

Llamamos a R_1 tiempo de regeneración, y decimos que X se regenera en este punto.

$\{X(t + R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Definición 37.7.35 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty X(u)\, du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty I_x(u)\, du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\,dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.7.32 *a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.*

b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Definición 37.7.36 *Para el proceso $\{(N(t), X(t)) : t \geq 0\}$, sus trayectoria muestrales en el intervalo de tiempo $[T_{n-1}, T_n)$ están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1} + t) : 0 \leq t < \xi_n\})$$

Este ζ_n es el n-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos T_n si sus segmentos ζ_n son independientes e idénticamennte distribuidos.

Nota 37.7.33 *Si $\tilde{X}(t)$ con espacio de estados $\tilde{S}$ es regenerativo sobre T_n, entonces $X(t) = f\left(\tilde{X}(t)\right)$ también es regenerativo sobre T_n, para cualquier función $f : \tilde{S} \to S$.*

Nota 37.7.34 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Definición 37.7.37 (Definición Clásica) *Un proceso estocástico $X = \{X(t) : t \geq 0\}$ es llamado regenerativo is existe una variable aleatoria $R_1 > 0$ tal que*

i) $\{X(t + R_1) : t \geq 0\}$ es independiente de $\{\{X(t) : t < R_1\},\}$

ii) $\{X(t + R_1) : t \geq 0\}$ es estocásticamente equivalente a $\{X(t) : t > 0\}$

Llamamos a R_1 tiempo de regeneración, y decimos que X se regenera en este punto.

$\{X(t + R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Nota 37.7.35 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Definición 37.7.38 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty X(u)\,du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty I_x(u)\,du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\,dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.7.36 *a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.*

b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\{V(t-s) \in A | X_1 > t - s\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones (*puntos de regeneración*) que ocurren en $[0, t]$. El intervalo $[0, X_1)$ es llamado *primer ciclo de regeneración* de $\{V(t), t \geq 0\}$, $[X_1, X_1 + X_2)$ el *segundo ciclo de regeneración*, y así sucesivamente.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 37.7.39 *Se define el proceso estacionario, $\{V^*(t), t \geq 0\}$, para $\{V(t), t \geq 0\}$ por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]} \int_0^\infty \mathbb{P}\{V(t+x) \in A | X > x\}(1 - F(x))\, dx,$$

para todo $t \geq 0$ y todo conjunto de Borel A.

Definición 37.7.40 *Una distribución se dice que es* aritmética *si todos sus puntos de incremento son múltiplos de la forma $0, \lambda, 2\lambda, \ldots$ para alguna $\lambda > 0$ entera.*

Definición 37.7.41 *Una modificación medible de un proceso $\{V(t), t \geq 0\}$, es una versión de este, $\{V(t, w)\}$ conjuntamente medible para $t \geq 0$ y para $w \in S$, S espacio de estados para $\{V(t), t \geq 0\}$.*

Teorema 37.7.31 *Sea $\{V(t), t \geq\}$ un proceso regenerativo no negativo con modificación medible. Sea $\mathbb{E}[X] < \infty$. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de t, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\, ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$, equivalentemente, si $\mathbb{E}\left[\int_0^X V(s)\, ds\right] < \infty$,entonces

$$\frac{\int_0^t V(s)\, ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\, ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$.

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\{V(t-s) \in A | X_1 > t - s\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones (*puntos de regeneración*) que ocurren en $[0, t]$. El intervalo $[0, X_1)$ es llamado *primer ciclo de regeneración* de $\{V(t), t \geq 0\}$, $[X_1, X_1 + X_2)$ el *segundo ciclo de regeneración*, y así sucesivamente.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 37.7.42 *Se define el proceso estacionario, $\{V^*(t), t \geq 0\}$, para $\{V(t), t \geq 0\}$ por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]} \int_0^\infty \mathbb{P}\{V(t+x) \in A | X > x\}(1 - F(x))\, dx,$$

para todo $t \geq 0$ y todo conjunto de Borel A.

Definición 37.7.43 *Una distribución se dice que es* aritmética *si todos sus puntos de incremento son múltiplos de la forma $0, \lambda, 2\lambda, \ldots$ para alguna $\lambda > 0$ entera.*

Definición 37.7.44 *Una modificación medible de un proceso $\{V(t), t \geq 0\}$, es una versión de este, $\{V(t,w)\}$ conjuntamente medible para $t \geq 0$ y para $w \in S$, S espacio de estados para $\{V(t), t \geq 0\}$.*

Teorema 37.7.32 *Sea $\{V(t), t \geq\}$ un proceso regenerativo no negativo con modificación medible. Sea $\mathbb{E}[X] < \infty$. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de t, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$, equivalentemente, si $\mathbb{E}\left[\int_0^X V(s)\,ds\right] < \infty$,entonces

$$\frac{\int_0^t V(s)\,ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$.

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Sean $T_1, T_2, \ldots$ los puntos donde las longitudes de las colas de la red de sistemas de visitas cíclicas son cero simultáneamente, cuando la cola Q_j es visitada por el servidor para dar servicio, es decir, $L_1(T_i) = 0, L_2(T_i) = 0, \hat{L}_1(T_i) = 0$ y $\hat{L}_2(T_i) = 0$, a estos puntos se les denominará puntos regenerativos. Sea la función generadora de momentos para L_i, el número de usuarios en la cola $Q_i(z)$ en cualquier momento, está dada por el tiempo promedio de $z^{L_i(t)}$ sobre el ciclo regenerativo definido anteriormente:

$$Q_i(z) = \mathbb{E}\left[z^{L_i(t)}\right] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i}\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}\left[\sum_{m=1}^{M_i}\tau_i(m+1)-\tau_i(m)\right]}$$

M_i es un tiempo de paro en el proceso regenerativo con $\mathbb{E}[M_i] < \infty$[4], se sigue del lema de Wald que:

$$\mathbb{E}\left[\sum_{m=1}^{M_i}\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = \mathbb{E}[M_i]\,\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]$$

$$\mathbb{E}\left[\sum_{m=1}^{M_i}\tau_i(m+1)-\tau_i(m)\right] = \mathbb{E}[M_i]\,\mathbb{E}[\tau_i(m+1)-\tau_i(m)]$$

por tanto se tiene que

$$Q_i(z) = \frac{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}[\tau_i(m+1)-\tau_i(m)]}$$

observar que el denominador es simplemente la duración promedio del tiempo del ciclo.

Haciendo las siguientes sustituciones en la ecuación (**??**): $n \to t - \tau_i(m)$, $T \to \overline{\tau}_i(m) - \tau_i(m)$, $L_n \to L_i(t)$ y $F(z) = \mathbb{E}\left[z^{L_0}\right] \to F_i(z) = \mathbb{E}\left[z^{L_i\tau_i(m)}\right]$, se puede ver que

$$\mathbb{E}\left[\sum_{n=0}^{T-1} z^{L_n}\right] = \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\overline{\tau}_i(m)-1} z^{L_i(t)}\right] = z\frac{F_i(z)-1}{z-P_i(z)} \tag{37.7.44}$$

Por otra parte durante el tiempo de intervisita para la cola i, $L_i(t)$ solamente se incrementa de manera que el incremento por intervalo de tiempo está dado por la función generadora de probabilidades de $P_i(z)$, por tanto la suma sobre el tiempo de intervisita puede evaluarse como:

[4]En Stidham[41] y Heyman se muestra que una condición suficiente para que el proceso regenerativo estacionario sea un procesoo estacionario es que el valor esperado del tiempo del ciclo regenerativo sea finito, es decir: $\mathbb{E}\left[\sum_{m=1}^{M_i} C_i^{(m)}\right] < \infty$, como cada $C_i^{(m)}$ contiene intervalos de réplica positivos, se tiene que $\mathbb{E}[M_i] < \infty$, además, como $M_i > 0$, se tiene que la condición anterior es equivalente a tener que $\mathbb{E}[C_i] < \infty$, por lo tanto una condición suficiente para la existencia del proceso regenerativo está dada por $\sum_{k=1}^{N}\mu_k < 1$.

$$\begin{aligned}\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] &= \mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} \{P_i(z)\}^{t-\overline{\tau}_i(m)}\right] = \frac{1-\mathbb{E}\left[\{P_i(z)\}^{\tau_i(m+1)-\overline{\tau}_i(m)}\right]}{1-P_i(z)} \\ &= \frac{1-I_i[P_i(z)]}{1-P_i(z)}\end{aligned}$$

por tanto

$$\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right] = \frac{1-F_i(z)}{1-P_i(z)}$$

Por lo tanto

$$\begin{aligned}Q_i(z) &= \frac{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}[\tau_i(m+1)-\tau_i(m)]} \\ &= \frac{1}{\mathbb{E}[\tau_i(m+1)-\tau_i(m)]}\left\{\mathbb{E}\left[\sum_{t=\tau_i(m)}^{\overline{\tau}_i(m)-1} z^{L_i(t)}\right]+\mathbb{E}\left[\sum_{t=\overline{\tau}_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]\right\} \\ &= \frac{1}{\mathbb{E}[\tau_i(m+1)-\tau_i(m)]}\left\{z\frac{F_i(z)-1}{z-P_i(z)}+\frac{1-F_i(z)}{1-P_i(z)}\right\}\end{aligned}$$

es decir

$$Q_i(z) = \frac{1}{\mathbb{E}[C_i]}\cdot\frac{1-F_i(z)}{P_i(z)-z}\cdot\frac{(1-z)P_i(z)}{1-P_i(z)} \tag{37.7.45}$$

Teorema 37.7.33 *Dada una Red de Sistemas de Visitas Cíclicas (RSVC), conformada por dos Sistemas de Visitas Cíclicas (SVC), donde cada uno de ellos consta de dos colas tipo $M/M/1$. Los dos sistemas están comunicados entre sí por medio de la transferencia de usuarios entre las colas $Q_1 \leftrightarrow Q_3$ y $Q_2 \leftrightarrow Q_4$. Se definen los eventos para los procesos de arribos al tiempo t, $A_j(t) = \{0$ arribos en Q_j al tiempo $t\}$ para algún tiempo $t \geq 0$ y Q_j la cola j-ésima en la RSVC, para $j = 1,2,3,4$. Existe un intervalo $I \neq \emptyset$ tal que para $T^* \in I$, tal que $\mathbb{P}\{A_1(T^*), A_2(Tt^*), A_3(T^*), A_4(T^*) | T^* \in I\} > 0$.*

Demostración 37.7.1 *Sin pérdida de generalidad podemos considerar como base del análisis a la cola Q_1 del primer sistema que conforma la RSVC.*

Sea $n > 0$, ciclo en el primer sistema en el que se sabe que $L_j(\overline{\tau}_1(n)) = 0$, pues la política de servicio con que atienden los servidores es la exhaustiva. Como es sabido, para trasladarse a la siguiente cola, el servidor incurre en un tiempo de traslado $r_1(n) > 0$, entonces tenemos que $\tau_2(n) = \overline{\tau}_1(n) + r_1(n)$.

Definamos el intervalo $I_1 \equiv [\overline{\tau}_1(n), \tau_2(n)]$ de longitud $\xi_1 = r_1(n)$. Dado que los tiempos entre arribo son exponenciales con tasa $\tilde{\mu}_1 = \mu_1 + \hat{\mu}_1$ (μ_1 son los arribos a Q_1 por primera vez al sistema, mientras que $\hat{\mu}_1$ son los arribos de traslado procedentes de Q_3) se tiene que la probabilidad del evento $A_1(t)$ está dada por

$$\mathbb{P}\{A_1(t) | t \in I_1(n)\} = e^{-\tilde{\mu}_1 \xi_1(n)}. \tag{37.7.46}$$

Por otra parte, para la cola Q_2, el tiempo $\overline{\tau}_2(n-1)$ es tal que $L_2(\overline{\tau}_2(n-1)) = 0$, es decir, es el tiempo en que la cola queda totalmente vacía en el ciclo anterior a n. Entonces tenemos un sgundo intervalo $I_2 \equiv [\overline{\tau}_2(n-1), \tau_2(n)]$. Por lo tanto la probabilidad del evento $A_2(t)$ tiene probabilidad dada por

$$\mathbb{P}\{A_2(t) | t \in I_2(n)\} = e^{-\tilde{\mu}_2 \xi_2(n)}, \tag{37.7.47}$$

donde $\xi_2(n) = \tau_2(n) - \overline{\tau}_2(n-1)$.

Entonces, se tiene que

$$\begin{aligned}\mathbb{P}\{A_1(t), A_2(t) | t \in I_1(n)\} &= \mathbb{P}\{A_1(t) | t \in I_1(n)\}\,\mathbb{P}\{A_2(t) | t \in I_1(n)\} \\ &\geq \mathbb{P}\{A_1(t) | t \in I_1(n)\}\,\mathbb{P}\{A_2(t) | t \in I_2(n)\} \\ &= e^{-\tilde{\mu}_1 \xi_1(n)} e^{-\tilde{\mu}_2 \xi_2(n)} = e^{-[\tilde{\mu}_1 \xi_1(n) + \tilde{\mu}_2 \xi_2(n)]}.\end{aligned}$$

es decir,

$$\mathbb{P}\{A_1(t), A_2(t) | t \in I_1(n)\} = e^{-[\tilde{\mu}_1 \xi_1(n) + \tilde{\mu}_2 \xi_2(n)]} > 0. \tag{37.7.48}$$

En lo que respecta a la relación entre los dos SVC que conforman la RSVC, se afirma que existe $m > 0$ tal que $\overline{\tau}_3(m) < \tau_2(n) < \tau_4(m)$.

Para Q_3 sea $I_3 = [\overline{\tau}_3(m), \tau_4(m)]$ con longitud $\xi_3(m) = r_3(m)$, entonces

$$\mathbb{P}\{A_3(t) | t \in I_3(n)\} = e^{-\tilde{\mu}_3 \xi_3(n)}. \tag{37.7.49}$$

Análogamente que como se hizo para Q_2, tenemos que para Q_4 se tiene el intervalo $I_4 = [\overline{\tau}_4(m-1), \tau_4(m)]$ con longitud $\xi_4(m) = \tau_4(m) - \overline{\tau}_4(m-1)$, entonces

$$\mathbb{P}\{A_4(t) | t \in I_4(m)\} = e^{-\tilde{\mu}_4 \xi_4(n)}. \tag{37.7.50}$$

Al igual que para el primer sistema, dado que $I_3(m) \subset I_4(m)$, se tiene que

$$\begin{array}{rcl} \xi_3(m) \leq \xi_4(m) & \Leftrightarrow & -\xi_3(m) \geq -\xi_4(m) \\ -\tilde{\mu}_4 \xi_3(m) \geq -\tilde{\mu}_4 \xi_4(m) & \Leftrightarrow & e^{-\tilde{\mu}_4 \xi_3(m)} \geq e^{-\tilde{\mu}_4 \xi_4(m)} \\ \mathbb{P}\{A_4(t) | t \in I_3(m)\} & \geq & \mathbb{P}\{A_4(t) | t \in I_4(m)\} \end{array}$$

Entonces, dado que los eventos A_3 y A_4 son independientes, se tiene que

$$\begin{array}{rcl} \mathbb{P}\{A_3(t), A_4(t) | t \in I_3(m)\} & = & \mathbb{P}\{A_3(t) | t \in I_3(m)\} \mathbb{P}\{A_4(t) | t \in I_3(m)\} \\ & \geq & \mathbb{P}\{A_3(t) | t \in I_3(n)\} \mathbb{P}\{A_4(t) | t \in I_4(n)\} \\ & = & e^{-\tilde{\mu}_3 \xi_3(m)} e^{-\tilde{\mu}_4 \xi_4(m)} = e^{-[\tilde{\mu}_3 \xi_3(m) + \tilde{\mu}_4 \xi_4(m)]}. \end{array}$$

es decir,

$$\mathbb{P}\{A_3(t), A_4(t) | t \in I_3(m)\} = e^{-[\tilde{\mu}_3 \xi_3(m) + \tilde{\mu}_4 \xi_4(m)]} > 0. \tag{37.7.51}$$

Por construcción se tiene que $I(n,m) \equiv I_1(n) \cap I_3(m) \neq \emptyset$,entonces en particular se tienen las contenciones $I(n,m) \subseteq I_1(n)$ y $I(n,m) \subseteq I_3(m)$, por lo tanto si definimos $\xi_{n,m} \equiv \ell(I(n,m))$ tenemos que

$$\xi_{n,m} \leq \xi_1(n) \text{ y } \xi_{n,m} \leq \xi_3(m) \text{ entonces } -\xi_{n,m} \geq -\xi_1(n) \text{ y } -\xi_{n,m} \leq -\xi_3(m)$$

por lo tanto tenemos las desigualdades

$$\begin{array}{ll} -\tilde{\mu}_1 \xi_{n,m} \geq -\tilde{\mu}_1 \xi_1(n), & -\tilde{\mu}_2 \xi_{n,m} \geq -\tilde{\mu}_2 \xi_1(n) \geq -\tilde{\mu}_2 \xi_2(n), \\ -\tilde{\mu}_3 \xi_{n,m} \geq -\tilde{\mu}_3 \xi_3(m), & -\tilde{\mu}_4 \xi_{n,m} \geq -\tilde{\mu}_4 \xi_3(m) \geq -\tilde{\mu}_4 \xi_4(m). \end{array}$$

Sea $T^* \in I_{n,m}$, entonces dado que en particular $T^* \in I_1(n)$ se cumple con probabilidad positiva que no hay arribos a las colas Q_1 y Q_2, en consecuencia, tampoco hay usuarios de transferencia para Q_3 y Q_4, es decir, $\tilde{\mu}_1 = \mu_1$, $\tilde{\mu}_2 = \mu_2$, $\tilde{\mu}_3 = \mu_3$, $\tilde{\mu}_4 = \mu_4$, es decir, los eventos Q_1 y Q_3 son condicionalmente independientes en el intervalo $I_{n,m}$; lo mismo ocurre para las colas Q_2 y Q_4, por lo tanto tenemos que

$$\begin{array}{l} \mathbb{P}\{A_1(T^*), A_2(T^*), A_3(T^*), A_4(T^*) | T^* \in I_{n,m}\} = \prod_{j=1}^{4} \mathbb{P}\{A_j(T^*) | T^* \in I_{n,m}\} \\ \geq \mathbb{P}\{A_1(T^*) | T^* \in I_1(n)\} \mathbb{P}\{A_2(T^*) | T^* \in I_2(n)\} \mathbb{P}\{A_3(T^*) | T^* \in I_3(m)\} \mathbb{P}\{A_4(T^*) | T^* \in I_4(m)\} \\ = e^{-\mu_1 \xi_1(n)} e^{-\mu_2 \xi_2(n)} e^{-\mu_3 \xi_3(m)} e^{-\mu_4 \xi_4(m)} = e^{-[\tilde{\mu}_1 \xi_1(n) + \tilde{\mu}_2 \xi_2(n) + \tilde{\mu}_3 \xi_3(m) + \tilde{\mu}_4 \xi_4(m)]} > 0. \end{array} \tag{37.7.52}$$

Estos resultados aparecen en Daley (1968) [13] para $\{T_n\}$ intervalos de inter-arribo, $\{D_n\}$ intervalos de inter-salida y $\{S_n\}$ tiempos de servicio.

- Si el proceso $\{T_n\}$ es Poisson, el proceso $\{D_n\}$ es no correlacionado si y sólo si es un proceso Poisso, lo cual ocurre si y sólo si $\{S_n\}$ son exponenciales negativas.
- Si $\{S_n\}$ son exponenciales negativas, $\{D_n\}$ es un proceso de renovación si y sólo si es un proceso Poisson, lo cual ocurre si y sólo si $\{T_n\}$ es un proceso Poisson.
- $\mathbb{E}(D_n) = \mathbb{E}(T_n)$.
- Para un sistema de visitas $GI/M/1$ se tiene el siguiente teorema:

  Teorema 37.7.34 *En un sistema estacionario $GI/M/1$ los intervalos de interpartida tienen*

$$\begin{array}{rcl} \mathbb{E}\left(e^{-\theta D_n}\right) & = & \mu(\mu+\theta)^{-1}[\delta\theta - \mu(1-\delta)\alpha(\theta)]\left[\theta - \mu(1-\delta)^{-1}\right] \\ \alpha(\theta) & = & \mathbb{E}\left[e^{-\theta T_0}\right] \\ var(D_n) & = & var(T_0) - \left(\tau^{-1} - \delta^{-1}\right) 2\delta(\mathbb{E}(S_0))^2 (1-\delta)^{-1}. \end{array}$$

Teorema 37.7.35 *El proceso de salida de un sistema de colas estacionario $GI/M/1$ es un proceso de renovación si y sólo si el proceso de entrada es un proceso Poisson, en cuyo caso el proceso de salida es un proceso Poisson.*

Teorema 37.7.36 *Los intervalos de interpartida $\{D_n\}$ de un sistema $M/G/1$ estacionario son no correlacionados si y sólo si la distribución de los tiempos de servicio es exponencial negativa, es decir, el sistema es de tipo $M/M/1$.*

En Sigman, Thorison y Wolff [40] prueban que para la existencia de un una sucesión infinita no decreciente de tiempos de regeneración $\tau_1 \leq \tau_2 \leq \cdots$ en los cuales el proceso se regenera, basta un tiempo de regeneración R_1, donde $R_j = \tau_j - \tau_{j-1}$. Para tal efecto se requiere la existencia de un espacio de probabilidad $(\Omega, \mathcal{F}, \mathbb{P})$, y proceso estocástico $X = \{X(t) : t \geq 0\}$ con espacio de estados $(S, \mathcal{R})$, con $\mathcal{R}$ σ-álgebra.

Proposición 37.7.24 *Si existe una variable aleatoria no negativa R_1 tal que $\theta_{R1}X =_D X$, entonces $(\Omega, \mathcal{F}, \mathbb{P})$ puede extenderse para soportar una sucesión estacionaria de variables aleatorias $R = \{R_k : k \geq 1\}$, tal que para $k \geq 1$,*

$$\theta_k (X, R) =_D (X, R).$$

Además, para $k \geq 1$, $\theta_k R$ es condicionalmente independiente de $(X, R_1, \ldots, R_k)$, dado $\theta_{\tau k} X$.

- Doob en 1953 demostró que el estado estacionario de un proceso de partida en un sistema de espera $M/G/\infty$, es Poisson con la misma tasa que el proceso de arribos.
- Burke en 1968, fue el primero en demostrar que el estado estacionario de un proceso de salida de una cola $M/M/s$ es un proceso Poisson.
- Disney en 1973 obtuvo el siguiente resultado:

  Teorema 37.7.37 *Para el sistema de espera $M/G/1/L$ con disciplina FIFO, el proceso $\boldsymbol{I}$ es un proceso de renovación si y sólo si el proceso denominado longitud de la cola es estacionario y se cumple cualquiera de los siguientes casos:*

  a) Los tiempos de servicio son identicamente cero;
  b) $L = 0$, para cualquier proceso de servicio S;
  c) $L = 1$ y $G = D$;
  d) $L = \infty$ y $G = M$.

  En estos casos, respectivamente, las distribuciones de interpartida $P\{T_{n+1} - T_n \leq t\}$ son

  a) $1 - e^{-\lambda t}$, $t \geq 0$;
  b) $1 - e^{-\lambda t} * F(t)$, $t \geq 0$;
  c) $1 - e^{-\lambda t} * \mathbb{1}_d(t)$, $t \geq 0$;
  d) $1 - e^{-\lambda t} * F(t)$, $t \geq 0$.

- Finch (1959) mostró que para los sistemas $M/G/1/L$, con $1 \leq L \leq \infty$ con distribuciones de servicio dos veces diferenciable, solamente el sistema $M/M/1/\infty$ tiene proceso de salida de renovación estacionario.
- King (1971) demostro que un sistema de colas estacionario $M/G/1/1$ tiene sus tiempos de interpartida sucesivas D_n y D_{n+1} son independientes, si y sólo si, $G = D$, en cuyo caso le proceso de salida es de renovación.
- Disney (1973) demostró que el único sistema estacionario $M/G/1/L$, que tiene proceso de salida de renovación son los sistemas $M/M/1$ y $M/D/1/1$.
- El siguiente resultado es de Disney y Koning (1985)

  Teorema 37.7.38 *En un sistema de espera $M/G/s$, el estado estacionario del proceso de salida es un proceso Poisson para cualquier distribución de los tiempos de servicio si el sistema tiene cualquiera de las siguientes cuatro propiedades.*

  a) $s = \infty$
  b) La disciplina de servicio es de procesador compartido.
  c) La disciplina de servicio es LCFS y preemptive resume, esto se cumple para $L < \infty$
  d) $G = M$.

- El siguiente resultado es de Alamatsaz (1983)

  Teorema 37.7.39 *En cualquier sistema de colas $GI/G/1/L$ con $1 \leq L < \infty$ y distribución de interarribos A y distribución de los tiempos de servicio B, tal que $A(0) = 0$, $A(t)(1 - B(t)) > 0$ para alguna $t > 0$ y $B(t)$ para toda $t > 0$, es imposible que el proceso de salida estacionario sea de renovación.*

Estos resultados aparecen en Daley (1968) [13] para $\{T_n\}$ intervalos de inter-arribo, $\{D_n\}$ intervalos de inter-salida y $\{S_n\}$ tiempos de servicio.

- Si el proceso $\{T_n\}$ es Poisson, el proceso $\{D_n\}$ es no correlacionado si y sólo si es un proceso Poisso, lo cual ocurre si y sólo si $\{S_n\}$ son exponenciales negativas.

- Si $\{S_n\}$ son exponenciales negativas, $\{D_n\}$ es un proceso de renovación si y sólo si es un proceso Poisson, lo cual ocurre si y sólo si $\{T_n\}$ es un proceso Poisson.
- $\mathbb{E}(D_n) = \mathbb{E}(T_n)$.
- Para un sistema de visitas $GI/M/1$ se tiene el siguiente teorema:

Teorema 37.7.40 *En un sistema estacionario $GI/M/1$ los intervalos de interpartida tienen*

$$\begin{aligned}
\mathbb{E}\left(e^{-\theta D_n}\right) &= \mu(\mu+\theta)^{-1}\left[\delta\theta - \mu(1-\delta)\alpha(\theta)\right]\left[\theta - \mu(1-\delta)^{-1}\right] \\
\alpha(\theta) &= \mathbb{E}\left[e^{-\theta T_0}\right] \\
var(D_n) &= var(T_0) - \left(\tau^{-1} - \delta^{-1}\right) 2\delta\left(\mathbb{E}(S_0)\right)^2(1-\delta)^{-1}.
\end{aligned}$$

Teorema 37.7.41 *El proceso de salida de un sistema de colas estacionario $GI/M/1$ es un proceso de renovación si y sólo si el proceso de entrada es un proceso Poisson, en cuyo caso el proceso de salida es un proceso Poisson.*

Teorema 37.7.42 *Los intervalos de interpartida $\{D_n\}$ de un sistema $M/G/1$ estacionario son no correlacionados si y sólo si la distribución de los tiempos de servicio es exponencial negativa, es decir, el sistema es de tipo $M/M/1$.*

Sean Q_1, Q_2, Q_3 y Q_4 en una Red de Sistemas de Visitas Cíclicas (RSVC). Supongamos que cada una de las colas es del tipo $M/M/1$ con tasa de arribo μ_i y que la transferencia de usuarios entre los dos sistemas ocurre entre $Q_1 \leftrightarrow Q_3$ y $Q_2 \leftrightarrow Q_4$ con respectiva tasa de arribo igual a la tasa de salida $\hat{\mu}_i = \mu_i$, esto se sabe por lo desarrollado en la sección anterior.

Consideremos, sin pérdida de generalidad como base del análisis, la cola Q_1 además supongamos al servidor lo comenzamos a observar una vez que termina de atender a la misma para desplazarse y llegar a Q_2, es decir al tiempo τ_2.

Sea $n \in \mathbb{N}$, $n > 0$, ciclo del servidor en que regresa a Q_1 para dar servicio y atender conforme a la política exhaustiva, entonces se tiene que $\overline{\tau}_1(n)$ es el tiempo del servidor en el sistema 1 en que termina de dar servicio a todos los usuarios presentes en la cola, por lo tanto se cumple que $L_1(\overline{\tau}_1(n)) = 0$, entonces el servidor para llegar a Q_2 incurre en un tiempo de traslado r_1 y por tanto se cumple que $\tau_2(n) = \overline{\tau}_1(n) + r_1$. Dado que los tiempos entre arribos son exponenciales se cumple que

$$\begin{aligned}
&\mathbb{P}\{0 \text{ arribos en } Q_1 \text{ en el intervalo } [\overline{\tau}_1(n), \overline{\tau}_1(n) + r_1]\} = e^{-\tilde{\mu}_1 r_1}, \\
&\mathbb{P}\{0 \text{ arribos en } Q_2 \text{ en el intervalo } [\overline{\tau}_1(n), \overline{\tau}_1(n) + r_1]\} = e^{-\tilde{\mu}_2 r_1}.
\end{aligned}$$

El evento que nos interesa consiste en que no haya arribos desde que el servidor abandonó Q_2 y regresa nuevamente para dar servicio, es decir en el intervalo de tiempo $[\overline{\tau}_2(n-1), \tau_2(n)]$. Entonces, si hacemos

$$\begin{aligned}
\varphi_1(n) &\equiv \overline{\tau}_1(n) + r_1 = \overline{\tau}_2(n-1) + r_1 + r_2 + \overline{\tau}_1(n) - \tau_1(n) \\
&= \overline{\tau}_2(n-1) + \overline{\tau}_1(n) - \tau_1(n) + r, ,
\end{aligned}$$

y longitud del intervalo

$$\begin{aligned}
\xi &\equiv \overline{\tau}_1(n) + r_1 - \overline{\tau}_2(n-1) = \overline{\tau}_2(n-1) + \overline{\tau}_1(n) - \tau_1(n) + r - \overline{\tau}_2(n-1) \\
&= \overline{\tau}_1(n) - \tau_1(n) + r.
\end{aligned}$$

Entonces, determinemos la probabilidad del evento no arribos a Q_2 en $[\overline{\tau}_2(n-1), \varphi_1(n)]$:

$$\mathbb{P}\{0 \text{ arribos en } Q_2 \text{ en el intervalo } [\overline{\tau}_2(n-1), \varphi_1(n)]\} = e^{-\tilde{\mu}_2 \xi}. \tag{37.7.53}$$

De manera análoga, tenemos que la probabilidad de no arribos a Q_1 en $[\overline{\tau}_2(n-1), \varphi_1(n)]$ esta dada por

$$\mathbb{P}\{0 \text{ arribos en } Q_1 \text{ en el intervalo } [\overline{\tau}_2(n-1), \varphi_1(n)]\} = e^{-\tilde{\mu}_1 \xi}, \tag{37.7.54}$$

$$\mathbb{P}\{0 \text{ arribos en } Q_2 \text{ en el intervalo } [\overline{\tau}_2(n-1), \varphi_1(n)]\} = e^{-\tilde{\mu}_2 \xi}. \tag{37.7.55}$$

Por tanto

$$\begin{aligned}
&\mathbb{P}\{0 \text{ arribos en } Q_1 \text{ y } Q_2 \text{ en el intervalo } [\overline{\tau}_2(n-1), \varphi_1(n)]\} \\
&= \mathbb{P}\{0 \text{ arribos en } Q_1 \text{ en el intervalo } [\overline{\tau}_2(n-1), \varphi_1(n)]\} \\
&\times \mathbb{P}\{0 \text{ arribos en } Q_2 \text{ en el intervalo } [\overline{\tau}_2(n-1), \varphi_1(n)]\} = e^{-\tilde{\mu}_1 \xi} e^{-\tilde{\mu}_2 \xi} = e^{-\tilde{\mu} \xi}.
\end{aligned} \tag{37.7.56}$$

Para el segundo sistema, consideremos nuevamente $\overline{\tau}_1(n) + r_1$, sin pérdida de generalidad podemos suponer que existe $m > 0$ tal que $\overline{\tau}_3(m) < \overline{\tau}_1 + r_1 < \tau_4(m)$, entonces

$$\mathbb{P}\{0 \text{ arribos en } Q_3 \text{ en el intervalo } [\overline{\tau}_3(m), \overline{\tau}_1(n) + r_1]\} = e^{-\tilde{\mu}_3 \xi_3}, \tag{37.7.57}$$

donde

$$\xi_3 = \overline{\tau}_1(n) + r_1 - \overline{\tau}_3(m) = \overline{\tau}_1(n) - \overline{\tau}_3(m) + r_1, \tag{37.7.58}$$

mientras que para Q_4 al igual que con Q_2 escribiremos $\tau_4(m)$ en términos de $\overline{\tau}_4(m-1)$:
$\varphi_2 \equiv \tau_4(m) = \overline{\tau}_4(m-1) + r_4 + \overline{\tau}_3(m) - \tau_3(m) + r_3 = \overline{\tau}_4(m-1) + \overline{\tau}_3(m) - \tau_3(m) + \hat{r}$, además,
$\xi_2 \equiv \varphi_2(m) - \overline{\tau}_1 - r_1 = \overline{\tau}_4(m-1) + \overline{\tau}_3(m) - \tau_3(m) - \overline{\tau}_1(n) + \hat{r} - r_1$.
Entonces

$$\mathbb{P}\{0 \text{ arribos en } Q_4 \text{ en el intervalo } [\overline{\tau}_1(n) + r_1, \varphi_2(m)]\} = e^{-\tilde{\mu}_4 \xi_2}, \tag{37.7.59}$$

mientras que para Q_3 se tiene que

$$\mathbb{P}\{0 \text{ arribos en } Q_3 \text{ en el intervalo } [\overline{\tau}_1(n) + r_1, \varphi_2(m)]\} = e^{-\tilde{\mu}_3 \xi_2} \tag{37.7.60}$$

Por tanto

$$\mathbb{P}\{0 \text{ arribos en } Q_3 \wedge Q_4 \text{ en el intervalo } [\overline{\tau}_1(n) + r_1, \varphi_2(m)]\} = e^{-\hat{\mu} \xi_2} \tag{37.7.61}$$

donde $\hat{\mu} = \tilde{\mu}_3 + \tilde{\mu}_4$.

Ahora, definamos los intervalos $\mathcal{I}_1 = [\overline{\tau}_1(n) + r_1, \varphi_1(n)]$ y $\mathcal{I}_2 = [\overline{\tau}_1(n) + r_1, \varphi_2(m)]$, entonces, sea $\mathcal{I} = \mathcal{I}_1 \cap \mathcal{I}_2$ el intervalo donde cada una de las colas se encuentran vacías, es decir, si tomamos $T^* \in \mathcal{I}$, entonces $L_1(T^*) = L_2(T^*) = L_3(T^*) = L_4(T^*) = 0$.

Ahora, dado que por construcción $\mathcal{I} \neq \emptyset$ y que para $T^* \in \mathcal{I}$ en ninguna de las colas han llegado usuarios, se tiene que no hay transferencia entre las colas, por lo tanto, el sistema 1 y el sistema 2 son condicionalmente independientes en $\mathcal{I}$, es decir

$$\mathbb{P}\{L_1(T^*), L_2(T^*), L_3(T^*), L_4(T^*) | T^* \in \mathcal{I}\} = \prod_{j=1}^{4} \mathbb{P}\{L_j(T^*)\}, \tag{37.7.62}$$

para $T^* \in \mathcal{I}$.

Definición 37.7.45 (Definición Clásica) *Un proceso estocástico $X = \{X(t) : t \geq 0\}$ es llamado regenerativo is existe una variable aleatoria $R_1 > 0$ tal que*

i) $\{X(t + R_1) : t \geq 0\}$ *es independiente de* $\{\{X(t) : t < R_1\},\}$
ii) $\{X(t + R_1) : t \geq 0\}$ *es estocásticamente equivalente a* $\{X(t) : t > 0\}$

Llamamos a R_1 tiempo de regeneración, y decimos que X se regenera en este punto.

$\{X(t + R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Nota 37.7.37 *La existencia de un primer tiempo de regeneración, R_1, implica la existencia de una sucesión completa de estos tiempos $R_1, R_2 \ldots$, que satisfacen la propiedad deseada [40].*

Nota 37.7.38 *Para la cola $GI/GI/1$ los usuarios arriban con tiempos t_n y son atendidos con tiempos de servicio S_n, los tiempos de arribo forman un proceso de renovación con tiempos entre arribos independientes e identicamente distribuidos (`i.i.d.`)$T_n = t_n - t_{n-1}$, además los tiempos de servicio son `i.i.d.` e independientes de los procesos de arribo. Por estable se entiende que $\mathbb{E}S_n < \mathbb{E}T_n < \infty$.*

Definición 37.7.46 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t} \int_0^\infty X(u)\, du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t} \int_0^\infty I_x(u)\, du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\,dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.7.39 *Funciones de procesos regenerativos son regenerativas, es decir, si $X(t)$ es regenerativo y se define el proceso $Y(t)$ por $Y(t) = f(X(t))$ para alguna función Borel medible $f(\cdot)$. Además Y es regenerativo con los mismos tiempos de renovación que X.*

En general, los tiempos de renovación, Z_k de un proceso regenerativo no requieren ser tiempos de paro con respecto a la evolución de $X(t)$.

Nota 37.7.40 *Una función de un proceso de Markov, usualmente no será un proceso de Markov, sin embargo será regenerativo si el proceso de Markov lo es.*

Nota 37.7.41 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Nota 37.7.42 *a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.*

b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\{V(t-s) \in A | X_1 > t - s\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones (*puntos de regeneración*) que ocurren en $[0, t]$. El intervalo $[0, X_1)$ es llamado *primer ciclo de regeneración* de $\{V(t), t \geq 0\}$, $[X_1, X_1 + X_2)$ el *segundo ciclo de regeneración*, y así sucesivamente.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 37.7.47 *Se define el proceso estacionario, $\{V^*(t), t \geq 0\}$, para $\{V(t), t \geq 0\}$ por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]} \int_0^\infty \mathbb{P}\{V(t+x) \in A | X > x\}(1 - F(x))\,dx,$$

para todo $t \geq 0$ y todo conjunto de Borel A.

Definición 37.7.48 *Una distribución se dice que es* aritmética *si todos sus puntos de incremento son múltiplos de la forma $0, \lambda, 2\lambda, \ldots$ para alguna $\lambda > 0$ entera.*

Definición 37.7.49 *Una modificación medible de un proceso $\{V(t), t \geq 0\}$, es una versión de este, $\{V(t, w)\}$ conjuntamente medible para $t \geq 0$ y para $w \in S$, S espacio de estados para $\{V(t), t \geq 0\}$.*

Teorema 37.7.43 *Sea $\{V(t), t \geq\}$ un proceso regenerativo no negativo con modificación medible. Sea $\mathbb{E}[X] < \infty$. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de t, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$, equivalentemente, si $\mathbb{E}\left[\int_0^X V(s)\,ds\right] < \infty$,entonces

$$\frac{\int_0^t V(s)\,ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$.

Corolario 37.7.18 *Sea $\{V(t), t \geq 0\}$ un proceso regenerativo no negativo, con modificación medible. Si $\mathbb{E} < \infty$, F es no-aritmética, y para todo $x \geq 0$, $P\{V(t) \leq x, C > x\}$ es de variación acotada como función de t en cada intervalo finito $[0, \tau]$, entonces $V(t)$ converge en distribución cuando $t \to \infty$ y*

$$\mathbb{E}V = \frac{\mathbb{E}\int_0^X V(s)\,ds}{\mathbb{E}X}$$

Donde V tiene la distribución límite de $V(t)$ cuando $t \to \infty$.

Para el caso discreto se tienen resultados similares.

Definición 37.7.50 *Sean $0 \leq T_1 \leq T_2 \leq \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0, t)$ es*

$$N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t), \tag{37.7.63}$$

para $t \geq 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.7.51 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \geq 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0, t)$*

Nota 37.7.43 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^{n} \xi_k$ y $N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes NÃºmeros.*

Nota 37.7.44 *Una función $h : \mathbb{R}_+ \to \mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ es decreciente y Riemann Integrable.

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)| \leq b(t)$, donde b es DRI.

Teorema 37.7.44 (Teorema Principal de Renovación) *Si F es no aritmética y $h(t)$ es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty} U \star h = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds.$$

Proposición 37.7.25 *Cualquier función $H(t)$ acotada en intervalos finitos y que es 0 para $t < 0$ puede expresarse como*

$$H(t) = U \star h(t), \text{ donde } h(t) = H(t) - F \star H(t)$$

Definición 37.7.52 *Un proceso estocástico $X(t)$ es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}[X(T+t)|T] = \mathbb{E}[X(t)], \text{ para } t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.7.26 *Supóngase que $X(t)$ es un proceso crudamente regenerativo en T, que tiene distribución F. Si $\mathbb{E}[X(t)]$ es acotado en intervalos finitos, entonces*

$$\mathbb{E}[X(t)] = U \star h(t), \text{ donde } h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T > t)].$$

Teorema 37.7.45 (Regeneración Cruda) *Supóngase que $X(t)$ es un proceso con valores positivo crudamente regenerativo en T, y defínase $M = \sup\{|X(t)| : t \leq T\}$. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}[X(t)] = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds,$$

donde $h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T > t)]$.

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq \quad t &< T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.7.27 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Nota 37.7.45 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.7.46 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{37.7.64}$$

$$lim_{t\to\infty} t^{-1} N(t) = 1/\mu, \ c.s. \tag{37.7.65}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.7.19 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1} N(t) \to 1/\mu, \ c.s. \ cuando \ t \to \infty. \tag{37.7.66}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.7.53 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.7.47 *Supóngase que $n^{-1} T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \ c.s. \tag{37.7.67}$$

$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \ c.s. \tag{37.7.68}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.7.20 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \ c.s. \ cuando \ t \to \infty. \tag{37.7.69}$$

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq \quad t &< T_{N(t)+1}, \end{aligned}$$

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \ c.s. \ cuando \ t \to \infty. \tag{37.7.93}$$

Definición 37.7.58 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t<0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t)=h(t)+\int_{[0,t]}H(t-s)\,dF(s)\,,\ t\geq 0, \tag{37.7.94}$$

donde $H(t)$ es una función de valores reales. Esto es $H=h+F\star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t<0$.

Proposición 37.7.32 *La función $U\star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.7.56 (Teorema Renovación Elemental)

$$t^{-1}U(t)\to 1/\mu,\ \textit{cuando}\ t\to\infty.$$

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.7.59 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t)=\sum_{n=1}^{\infty}F^{n\star}(t)\,,\ t\geq 0,$$

donde $F^{0\star}(t)=\mathbb{1}(t\geq 0)$.

Proposición 37.7.33 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t>0$, y es $U^{'}(t)=\sum_{n=0}^{\infty}f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t)>N(t-)\}=0,\ t\geq 0.$$

Definición 37.7.60 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha)=\int_{\mathbb{R}_+}e^{-\alpha t}dF(t)\,,\ \alpha\geq 0.$$

Entonces

$$\hat{U}(\alpha)=\sum_{n=0}^{\infty}F^{\hat{n}\star}(\alpha)=\sum_{n=0}^{\infty}\hat{F}(\alpha)^{n}=\frac{1}{1-\hat{F}(\alpha)}.$$

Proposición 37.7.34 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha)=\frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.7.50 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)]=\lambda t$, para $t\geq 0$.*

Teorema 37.7.57 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t)=\mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f:\mathbb{R}_+\to\mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()}f(T_n)\right]=\int_{(0,t]}f(s)\,d\eta(s)\,,\ t\geq 0,$$

suponiendo que la integral exista. Además si $X_1,X_2,\ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n|T_n=s]=f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)}X_n\right]=\int_{(0,t]}f(s)\,d\eta(s)\,,\ t\geq 0,$$

suponiendo que la integral exista.

Corolario 37.7.29 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right]=\mu\mathbb{E}[N(t)+1]\,,\ t\geq 0,$$

Definición 37.7.61 *Sean $0 \leq T_1 \leq T_2 \leq \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0,t)$ es*

$$N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t), \tag{37.7.95}$$

para $t \geq 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.7.62 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \geq 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0,t)$*

Nota 37.7.51 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^{n} \xi_k$ y $N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes NÃºmeros.*

37.8. Renewal and Regenerative Processes: Serfozo[35]

Definición 37.8.1 *Sean $0 \leq T_1 \leq T_2 \leq \ldots$ son tiempos aleatorios infinitos en los cuales ocurren ciertos eventos. El número de tiempos T_n en el intervalo $[0,t)$ es*

$$N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t), \tag{37.8.1}$$

para $t \geq 0$.

Si se consideran los puntos T_n como elementos de $\mathbb{R}_+$, y $N(t)$ es el número de puntos en $\mathbb{R}$. El proceso denotado por $\{N(t) : t \geq 0\}$, denotado por $N(t)$, es un proceso puntual en $\mathbb{R}_+$. Los T_n son los tiempos de ocurrencia, el proceso puntual $N(t)$ es simple si su número de ocurrencias son distintas: $0 < T_1 < T_2 < \ldots$ casi seguramente.

Definición 37.8.2 *Un proceso puntual $N(t)$ es un proceso de renovación si los tiempos de interocurrencia $\xi_n = T_n - T_{n-1}$, para $n \geq 1$, son independientes e identicamente distribuidos con distribución F, donde $F(0) = 0$ y $T_0 = 0$. Los T_n son llamados tiempos de renovación, referente a la independencia o renovación de la información estocástica en estos tiempos. Los ξ_n son los tiempos de inter-renovación, y $N(t)$ es el número de renovaciones en el intervalo $[0,t)$*

Nota 37.8.1 *Para definir un proceso de renovación para cualquier contexto, solamente hay que especificar una distribución F, con $F(0) = 0$, para los tiempos de inter-renovación. La función F en turno degune las otra variables aleatorias. De manera formal, existe un espacio de probabilidad y una sucesión de variables aleatorias $\xi_1, \xi_2, \ldots$ definidas en este con distribución F. Entonces las otras cantidades son $T_n = \sum_{k=1}^{n} \xi_k$ y $N(t) = \sum_{n=1}^{\infty} \mathbb{1}(T_n \leq t)$, donde $T_n \to \infty$ casi seguramente por la Ley Fuerte de los Grandes Números.*

Los tiempos T_n están relacionados con los conteos de $N(t)$ por

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ T_{N(t)} \leq \quad t &< T_{N(t)+1}, \end{aligned}$$

además $N(T_n) = n$, y

$$N(t) = \text{máx}\{n : T_n \leq t\} = \text{mín}\{n : T_{n+1} > t\}$$

Por propiedades de la convolución se sabe que

$$P\{T_n \leq t\} = F^{n\star}(t)$$

que es la n-ésima convolución de F. Entonces

$$\begin{aligned} \{N(t) \geq n\} &= \{T_n \leq t\} \\ P\{N(t) \leq n\} &= 1 - F^{(n+1)\star}(t) \end{aligned}$$

Además usando el hecho de que $\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} P\{N(t) \geq n\}$ se tiene que

$$\mathbb{E}[N(t)] = \sum_{n=1}^{\infty} F^{n\star}(t)$$

Proposición 37.8.1 *Para cada $t \geq 0$, la función generadora de momentos $\mathbb{E}\left[e^{\alpha N(t)}\right]$ existe para alguna α en una vecindad del 0, y de aquí que $\mathbb{E}[N(t)^m] < \infty$, para $m \geq 1$.*

Ejemplo 37.8.1 (Proceso Poisson) *Suponga que se tienen tiempos de inter-renovación i.i.d. del proceso de renovación $N(t)$ tienen distribución exponencial $F(t) = q - e^{-\lambda t}$ con tasa λ. Entonces $N(t)$ es un proceso Poisson con tasa λ.*

Nota 37.8.2 *Si el primer tiempo de renovación ξ_1 no tiene la misma distribución que el resto de las ξ_n, para $n \geq 2$, a $N(t)$ se le llama Proceso de Renovación retardado, donde si ξ tiene distribución G, entonces el tiempo T_n de la n-ésima renovación tiene distribución $G \star F^{(n-1)\star}(t)$*

Teorema 37.8.1 *Para una constante $\mu \leq \infty$ (o variable aleatoria), las siguientes expresiones son equivalentes:*

$$lim_{n\to\infty} n^{-1} T_n = \mu, \ c.s. \tag{37.8.2}$$

$$lim_{t\to\infty} t^{-1} N(t) = 1/\mu, \ c.s. \tag{37.8.3}$$

Es decir, T_n satisface la Ley Fuerte de los Grandes Números sí y sólo sí $N/t)$ la cumple.

Corolario 37.8.1 (Ley Fuerte de los Grandes Números para Procesos de Renovación) *Si $N(t)$ es un proceso de renovación cuyos tiempos de inter-renovación tienen media $\mu \leq \infty$, entonces*

$$t^{-1} N(t) \to 1/\mu, \ c.s. \ cuando \ t \to \infty. \tag{37.8.4}$$

Considerar el proceso estocástico de valores reales $\{Z(t) : t \geq 0\}$ en el mismo espacio de probabilidad que $N(t)$

Definición 37.8.3 *Para el proceso $\{Z(t) : t \geq 0\}$ se define la fluctuación máxima de $Z(t)$ en el intervalo $(T_{n-1}, T_n]$:*

$$M_n = \sup_{T_{n-1} < t \leq T_n} |Z(t) - Z(T_{n-1})|$$

Teorema 37.8.2 *Supóngase que $n^{-1} T_n \to \mu$ c.s. cuando $n \to \infty$, donde $\mu \leq \infty$ es una constante o variable aleatoria. Sea a una constante o variable aleatoria que puede ser infinita cuando μ es finita, y considere las expresiones límite:*

$$lim_{n\to\infty} n^{-1} Z(T_n) = a, \ c.s. \tag{37.8.5}$$

$$lim_{t\to\infty} t^{-1} Z(t) = a/\mu, \ c.s. \tag{37.8.6}$$

La segunda expresión implica la primera. Conversamente, la primera implica la segunda si el proceso $Z(t)$ es creciente, o si $lim_{n\to\infty} n^{-1} M_n = 0$ c.s.

Corolario 37.8.2 *Si $N(t)$ es un proceso de renovación, y $(Z(T_n) - Z(T_{n-1}), M_n)$, para $n \geq 1$, son variables aleatorias independientes e idénticamente distribuidas con media finita, entonces,*

$$lim_{t\to\infty} t^{-1} Z(t) \to \frac{\mathbb{E}[Z(T_1) - Z(T_0)]}{\mathbb{E}[T_1]}, \ c.s. \ cuando \ t \to \infty. \tag{37.8.7}$$

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.8.4 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t) = \sum_{n=1}^{\infty} F^{n\star}(t), \ t \geq 0,$$

donde $F^{0\star}(t) = \mathbb{1}(t \geq 0)$.

Proposición 37.8.2 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t > 0$, y es $U^{'}(t) = \sum_{n=0}^{\infty} f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t) > N(t-)\} = 0, \ t \geq 0.$$

Definición 37.8.5 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha) = \int_{\mathbb{R}_+} e^{-\alpha t} dF(t), \ \alpha \geq 0.$$

Entonces

$$\hat{U}(\alpha) = \sum_{n=0}^{\infty} F^{\hat{n}\star}(\alpha) = \sum_{n=0}^{\infty} \hat{F}(\alpha)^n = \frac{1}{1-\hat{F}(\alpha)}.$$

Proposición 37.8.3 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha) = \frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.8.3 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)] = \lambda t$, para $t \geq 0$.*

Teorema 37.8.3 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t) = \mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f : \mathbb{R}_+ \to \mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()} f(T_n)\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista. Además si $X_1, X_2, \ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n | T_n = s] = f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)} X_n\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista.

Corolario 37.8.3 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right] = \mu \mathbb{E}[N(t)+1], \ t \geq 0,$$

Definición 37.8.6 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t < 0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t) = h(t) + \int_{[0,t]} H(t-s)\, dF(s), \ t \geq 0, \tag{37.8.8}$$

donde $H(t)$ es una función de valores reales. Esto es $H = h + F \star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t < 0$.

Proposición 37.8.4 *La función $U \star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.8.4 (Teorema Renovación Elemental)

$$t^{-1}U(t) \to 1/\mu, \text{ cuando } t \to \infty.$$

Supóngase que $N(t)$ es un proceso de renovación con distribución F con media finita μ.

Definición 37.8.7 *La función de renovación asociada con la distribución F, del proceso $N(t)$, es*

$$U(t) = \sum_{n=1}^{\infty} F^{n\star}(t), \ t \geq 0,$$

donde $F^{0\star}(t) = \mathbb{1}(t \geq 0)$.

Proposición 37.8.5 *Supóngase que la distribución de inter-renovación F tiene densidad f. Entonces $U(t)$ también tiene densidad, para $t > 0$, y es $U'(t) = \sum_{n=0}^{\infty} f^{n\star}(t)$. Además*

$$\mathbb{P}\{N(t) > N(t-)\} = 0, \ t \geq 0.$$

Definición 37.8.8 *La Transformada de Laplace-Stieljes de F está dada por*

$$\hat{F}(\alpha) = \int_{\mathbb{R}_+} e^{-\alpha t} dF(t), \ \alpha \geq 0.$$

Entonces

$$\hat{U}(\alpha) = \sum_{n=0}^{\infty} F^{\hat{n}\star}(\alpha) = \sum_{n=0}^{\infty} \hat{F}(\alpha)^n = \frac{1}{1-\hat{F}(\alpha)}.$$

Proposición 37.8.6 *La Transformada de Laplace $\hat{U}(\alpha)$ y $\hat{F}(\alpha)$ determina una a la otra de manera única por la relación $\hat{U}(\alpha) = \frac{1}{1-\hat{F}(\alpha)}$.*

Nota 37.8.4 *Un proceso de renovación $N(t)$ cuyos tiempos de inter-renovación tienen media finita, es un proceso Poisson con tasa λ si y sólo sí $\mathbb{E}[U(t)] = \lambda t$, para $t \geq 0$.*

Teorema 37.8.5 *Sea $N(t)$ un proceso puntual simple con puntos de localización T_n tal que $\eta(t) = \mathbb{E}[N()]$ es finita para cada t. Entonces para cualquier función $f : \mathbb{R}_+ \to \mathbb{R}$,*

$$\mathbb{E}\left[\sum_{n=1}^{N()} f(T_n)\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista. Además si $X_1, X_2, \ldots$ son variables aleatorias definidas en el mismo espacio de probabilidad que el proceso $N(t)$ tal que $\mathbb{E}[X_n | T_n = s] = f(s)$, independiente de n. Entonces

$$\mathbb{E}\left[\sum_{n=1}^{N(t)} X_n\right] = \int_{(0,t]} f(s)\, d\eta(s), \ t \geq 0,$$

suponiendo que la integral exista.

Corolario 37.8.4 (Identidad de Wald para Renovaciones) *Para el proceso de renovación $N(t)$,*

$$\mathbb{E}\left[T_{N(t)+1}\right] = \mu \mathbb{E}[N(t)+1], \ t \geq 0,$$

Definición 37.8.9 *Sea $h(t)$ función de valores reales en $\mathbb{R}$ acotada en intervalos finitos e igual a cero para $t < 0$ La ecuación de renovación para $h(t)$ y la distribución F es*

$$H(t) = h(t) + \int_{[0,t]} H(t-s)\, dF(s), \ t \geq 0, \tag{37.8.9}$$

donde $H(t)$ es una función de valores reales. Esto es $H = h + F \star H$. Decimos que $H(t)$ es solución de esta ecuación si satisface la ecuación, y es acotada en intervalos finitos e iguales a cero para $t < 0$.

Proposición 37.8.7 *La función $U \star h(t)$ es la única solución de la ecuación de renovación (37.8.9).*

Teorema 37.8.6 (Teorema Renovación Elemental)

$$t^{-1}U(t) \to 1/\mu, \text{ cuando } t \to \infty.$$

Nota 37.8.5 *Una función $h : \mathbb{R}_+ \to \mathbb{R}$ es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ *es decreciente y Riemann Integrable.*

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)| \leq b(t)$*, donde b es DRI.*

Teorema 37.8.7 (Teorema Principal de Renovación) *Si F es no aritmética y* $h(t)$ *es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty} U \star h = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds.$$

Proposición 37.8.8 *Cualquier función* $H(t)$ *acotada en intervalos finitos y que es 0 para* $t < 0$ *puede expresarse como*

$$H(t) = U \star h(t)\,,\ \textit{donde}\ h(t) = H(t) - F \star H(t)$$

Definición 37.8.10 *Un proceso estocástico* $X(t)$ *es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}[X(T+t)|T] = \mathbb{E}[X(t)]\,,\ \textit{para}\ t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.8.9 *Supóngase que* $X(t)$ *es un proceso crudamente regenerativo en T, que tiene distribución F. Si* $\mathbb{E}[X(t)]$ *es acotado en intervalos finitos, entonces*

$$\mathbb{E}[X(t)] = U \star h(t)\,,\ \textit{donde}\ h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T > t)]\,.$$

Teorema 37.8.8 (Regeneración Cruda) *Supóngase que* $X(t)$ *es un proceso con valores positivo crudamente regenerativo en T, y defínase* $M = \sup\{|X(t)| : t \leq T\}$*. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}[X(t)] = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds,$$

donde $h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T > t)]$.

Nota 37.8.6 *Una función* $h : \mathbb{R}_+ \to \mathbb{R}$ *es Directamente Riemann Integrable en los siguientes casos:*

a) $h(t) \geq 0$ *es decreciente y Riemann Integrable.*

b) h es continua excepto posiblemente en un conjunto de Lebesgue de medida 0, y $|h(t)| \leq b(t)$*, donde b es DRI.*

Teorema 37.8.9 (Teorema Principal de Renovación) *Si F es no aritmética y* $h(t)$ *es Directamente Riemann Integrable (DRI), entonces*

$$lim_{t\to\infty} U \star h = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds.$$

Proposición 37.8.10 *Cualquier función* $H(t)$ *acotada en intervalos finitos y que es 0 para* $t < 0$ *puede expresarse como*

$$H(t) = U \star h(t)\,,\ \textit{donde}\ h(t) = H(t) - F \star H(t)$$

Definición 37.8.11 *Un proceso estocástico* $X(t)$ *es crudamente regenerativo en un tiempo aleatorio positivo T si*

$$\mathbb{E}[X(T+t)|T] = \mathbb{E}[X(t)]\,,\ \textit{para}\ t \geq 0,$$

y con las esperanzas anteriores finitas.

Proposición 37.8.11 *Supóngase que* $X(t)$ *es un proceso crudamente regenerativo en T, que tiene distribución F. Si* $\mathbb{E}[X(t)]$ *es acotado en intervalos finitos, entonces*

$$\mathbb{E}[X(t)] = U \star h(t)\,,\ \textit{donde}\ h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T > t)]\,.$$

Teorema 37.8.10 (Regeneración Cruda) *Supóngase que* $X(t)$ *es un proceso con valores positivo crudamente regenerativo en T, y defínase* $M = \sup\{|X(t)| : t \leq T\}$*. Si T es no aritmético y M y MT tienen media finita, entonces*

$$lim_{t\to\infty}\mathbb{E}[X(t)] = \frac{1}{\mu}\int_{\mathbb{R}_+} h(s)\,ds,$$

donde $h(t) = \mathbb{E}[X(t)\,\mathbb{1}(T > t)]$.

Definición 37.8.12 *Para el proceso* $\{(N(t), X(t)) : t \geq 0\}$*, sus trayectoria muestrales en el intervalo de tiempo* $[T_{n-1}, T_n)$ *están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1} + t) : 0 \leq t < \xi_n\})$$

Este ζ_n *es el* n*-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos* T_n *si sus segmentos* ζ_n *son independientes e idénticamennte distribuidos.*

Nota 37.8.7 *Si* $\tilde{X}(t)$ *con espacio de estados* $\tilde{S}$ *es regenerativo sobre* T_n*, entonces* $X(t) = f\left(\tilde{X}(t)\right)$ *también es regenerativo sobre* T_n*, para cualquier función* $f : \tilde{S} \to S$*.*

Nota 37.8.8 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Nota 37.8.9 *Un proceso estocástico a tiempo continuo o discreto es regenerativo si existe un proceso de renovación tal que los segmentos del proceso entre tiempos de renovación sucesivos son i.i.d., es decir, para* $\{X(t) : t \geq 0\}$ *proceso estocástico a tiempo continuo con espacio de estados* S*, espacio métrico.*

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Definición 37.8.13 *Para el proceso* $\{(N(t), X(t)) : t \geq 0\}$*, sus trayectoria muestrales en el intervalo de tiempo* $[T_{n-1}, T_n)$ *están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1} + t) : 0 \leq t < \xi_n\})$$

Este ζ_n *es el* n*-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos* T_n *si sus segmentos* ζ_n *son independientes e idénticamennte distribuidos.*

Nota 37.8.10 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Teorema 37.8.11 (Procesos Regenerativos) *Suponga que el proceso*

Definición 37.8.14 (Renewal Process Trinity) *Para un proceso de renovación* $N(t)$*, los siguientes procesos proveen de información sobre los tiempos de renovación.*

- $A(t) = t - T_{N(t)}$*, el tiempo de recurrencia hacia atrás al tiempo* t*, que es el tiempo desde la última renovación para* t*.*
- $B(t) = T_{N(t)+1} - t$*, el tiempo de recurrencia hacia adelante al tiempo* t*, residual del tiempo de renovación, que es el tiempo para la próxima renovación después de* t*.*
- $L(t) = \xi_{N(t)+1} = A(t) + B(t)$*, la longitud del intervalo de renovación que contiene a* t*.*

Nota 37.8.11 *El proceso tridimensional* $(A(t), B(t), L(t))$ *es regenerativo sobre* T_n*, y por ende cada proceso lo es. Cada proceso* $A(t)$ *y* $B(t)$ *son procesos de MArkov a tiempo continuo con trayectorias continuas por partes en el espacio de estados* $\mathbb{R}_+$*. Una expresión conveniente para su distribución conjunta es, para* $0 \leq x < t, y \geq 0$

$$P\{A(t) > x, B(t) > y\} = P\{N(t+y) - N((t-x)) = 0\} \tag{37.8.10}$$

Ejemplo 37.8.2 (Tiempos de recurrencia Poisson) *Si* $N(t)$ *es un proceso Poisson con tasa* λ*, entonces de la expresión (37.8.10) se tiene que*

$$P\{A(t) > x, B(t) > y\} = e^{-\lambda(x+y)}, \quad 0 \leq x < t, y \geq 0,$$

que es la probabilidad Poisson de no renovaciones en un intervalo de longitud $x + y$*.*

Nota 37.8.12 *Una cadena de Markov ergódica tiene la propiedad de ser estacionaria si la distribución de su estado al tiempo* 0 *es su distribución estacionaria.*

Definición 37.8.15 *Un proceso estocástico a tiempo continuo* $\{X(t) : t \geq 0\}$ *en un espacio general es estacionario si sus distribuciones finito dimensionales son invariantes bajo cualquier traslado: para cada* $0 \leq s_1 < s_2 < \cdots < s_k$ *y* $t \geq 0$*,*

$$(X(s_1 + t), \ldots, X(s_k + t)) =_d (X(s_1), \ldots, X(s_k)).$$

Nota 37.8.13 *Un proceso de Markov es estacionario si* $X(t) =_d X(0)$*,* $t \geq 0$*.*

Considerese el proceso $N(t) = \sum_n 1\!\!1(\tau_n \leq t)$ en $\mathbb{R}_+$, con puntos $0 < \tau_1 < \tau_2 < \cdots$.

Proposición 37.8.12 *Si N es un proceso puntual estacionario y $\mathbb{E}[N(1)] < \infty$, entonces $\mathbb{E}[N(t)] = t\mathbb{E}[N(1)]$, $t \geq 0$*

Teorema 37.8.12 *Los siguientes enunciados son equivalentes*

i) El proceso retardado de renovación N es estacionario.

ii) EL proceso de tiempos de recurrencia hacia adelante $B(t)$ es estacionario.

iii) $\mathbb{E}[N(t)] = t/\mu$,

iv) $G(t) = F_e(t) = \frac{1}{\mu}\int_0^t [1 - F(s)]\, ds$

Cuando estos enunciados son ciertos, $P\{B(t) \leq x\} = F_e(x)$, para $t, x \geq 0$.

Nota 37.8.14 *Una consecuencia del teorema anterior es que el Proceso Poisson es el único proceso sin retardo que es estacionario.*

Corolario 37.8.5 *El proceso de renovación $N(t)$ sin retardo, y cuyos tiempos de inter renonación tienen media finita, es estacionario si y sólo si es un proceso Poisson.*

Nota 37.8.15 *Si $\tilde{X}(t)$ con espacio de estados $\tilde{S}$ es regenerativo sobre T_n, entonces $X(t) = f\left(\tilde{X}(t)\right)$ también es regenerativo sobre T_n, para cualquier función $f : \tilde{S} \to S$.*

Nota 37.8.16 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Definición 37.8.16 (Definición Clásica) *Un proceso estocástico $X = \{X(t) : t \geq 0\}$ es llamado regenerativo is existe una variable aleatoria $R_1 > 0$ tal que*

i) $\{X(t + R_1) : t \geq 0\}$ es independiente de $\{\{X(t) : t < R_1\},\}$

ii) $\{X(t + R_1) : t \geq 0\}$ es estocásticamente equivalente a $\{X(t) : t > 0\}$

Llamamos a R_1 tiempo de regeneración, y decimos que X se regenera en este punto.

$\{X(t + R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Definición 37.8.17 *Para x fijo y para cada $t \geq 0$, sea $I_x(t) = 1$ si $X(t) \leq x$, $I_x(t) = 0$ en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty X(u)\, du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t}\int_0^\infty I_x(u)\, du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\, dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.8.17 *a) Si el proceso regenerativo X es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.*

b) Si X es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso, $X_e = \{X_e(t)\}$, donde X_e es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como X_∞

Para $\{X(t) : t \geq 0\}$ Proceso Estocástico a tiempo continuo con estado de espacios S, que es un espacio métrico, con trayectorias continuas por la derecha y con límites por la izquierda c.s. Sea $N(t)$ un proceso de renovación en $\mathbb{R}_+$ definido en el mismo espacio de probabilidad que $X(t)$, con tiempos de renovación T y tiempos de inter-renovación $\xi_n = T_n - T_{n-1}$, con misma distribución F de media finita μ.

Definición 37.8.18 *Para el proceso* $\{(N(t), X(t)) : t \geq 0\}$*, sus trayectoria muestrales en el intervalo de tiempo* $[T_{n-1}, T_n)$ *están descritas por*

$$\zeta_n = (\xi_n, \{X(T_{n-1} + t) : 0 \leq t < \xi_n\})$$

Este ζ_n *es el* n*-ésimo segmento del proceso. El proceso es regenerativo sobre los tiempos* T_n *si sus segmentos* ζ_n *son independientes e idénticamennte distribuidos.*

Nota 37.8.18 *Si* $\tilde{X}(t)$ *con espacio de estados* $\tilde{S}$ *es regenerativo sobre* T_n*, entonces* $X(t) = f\left(\tilde{X}(t)\right)$ *también es regenerativo sobre* T_n*, para cualquier función* $f : \tilde{S} \to S$*.*

Nota 37.8.19 *Los procesos regenerativos son crudamente regenerativos, pero no al revés.*

Definición 37.8.19 (Definición Clásica) *Un proceso estocástico* $X = \{X(t) : t \geq 0\}$ *es llamado regenerativo is existe una variable aleatoria* $R_1 > 0$ *tal que*

i) $\{X(t + R_1) : t \geq 0\}$ *es independiente de* $\{\{X(t) : t < R_1\},\}$

ii) $\{X(t + R_1) : t \geq 0\}$ *es estocásticamente equivalente a* $\{X(t) : t > 0\}$

Llamamos a R_1 *tiempo de regeneración, y decimos que* X *se regenera en este punto.*

$\{X(t + R_1)\}$ es regenerativo con tiempo de regeneración R_2, independiente de R_1 pero con la misma distribución que R_1. Procediendo de esta manera se obtiene una secuencia de variables aleatorias independientes e idénticamente distribuidas $\{R_n\}$ llamados longitudes de ciclo. Si definimos a $Z_k \equiv R_1 + R_2 + \cdots + R_k$, se tiene un proceso de renovación llamado proceso de renovación encajado para X.

Nota 37.8.20 *Un proceso regenerativo con media de la longitud de ciclo finita es llamado positivo recurrente.*

Definición 37.8.20 *Para* x *fijo y para cada* $t \geq 0$*, sea* $I_x(t) = 1$ *si* $X(t) \leq x$*,* $I_x(t) = 0$ *en caso contrario, y defínanse los tiempos promedio*

$$\begin{aligned} \overline{X} &= lim_{t\to\infty} \frac{1}{t} \int_0^\infty X(u)\, du \\ \mathbb{P}(X_\infty \leq x) &= lim_{t\to\infty} \frac{1}{t} \int_0^\infty I_x(u)\, du, \end{aligned}$$

cuando estos límites existan.

Como consecuencia del teorema de Renovación-Recompensa, se tiene que el primer límite existe y es igual a la constante

$$\overline{X} = \frac{\mathbb{E}\left[\int_0^{R_1} X(t)\, dt\right]}{\mathbb{E}[R_1]},$$

suponiendo que ambas esperanzas son finitas.

Nota 37.8.21 *a) Si el proceso regenerativo* X *es positivo recurrente y tiene trayectorias muestrales no negativas, entonces la ecuación anterior es válida.*

b) Si X *es positivo recurrente regenerativo, podemos construir una única versión estacionaria de este proceso,* $X_e = \{X_e(t)\}$*, donde* X_e *es un proceso estocástico regenerativo y estrictamente estacionario, con distribución marginal distribuida como* X_∞

Un proceso estocástico a tiempo continuo $\{V(t), t \geq 0\}$ es un proceso regenerativo si existe una sucesión de variables aleatorias independientes e idénticamente distribuidas $\{X_1, X_2, \ldots\}$, sucesión de renovación, tal que para cualquier conjunto de Borel A,

$$\mathbb{P}\left\{V(t) \in A | X_1 + X_2 + \cdots + X_{R(t)} = s, \{V(\tau), \tau < s\}\right\} = \mathbb{P}\{V(t - s) \in A | X_1 > t - s\},$$

para todo $0 \leq s \leq t$, donde $R(t) = \text{máx}\{X_1 + X_2 + \cdots + X_j \leq t\}$ =número de renovaciones (*puntos de regeneración*) que ocurren en $[0, t]$. El intervalo $[0, X_1)$ es llamado *primer ciclo de regeneración* de $\{V(t), t \geq 0\}$, $[X_1, X_1 + X_2)$ el *segundo ciclo de regeneración*, y así sucesivamente.

Sea $X = X_1$ y sea F la función de distrbución de X

Definición 37.8.21 *Se define el proceso estacionario,* $\{V^*(t), t \geq 0\}$*, para* $\{V(t), t \geq 0\}$ *por*

$$\mathbb{P}\{V(t) \in A\} = \frac{1}{\mathbb{E}[X]} \int_0^\infty \mathbb{P}\{V(t + x) \in A | X > x\}(1 - F(x))\, dx,$$

para todo $t \geq 0$ *y todo conjunto de Borel* A*.*

Definición 37.8.22 *Una distribución se dice que es* aritmética *si todos sus puntos de incremento son múltiplos de la forma* $0, \lambda, 2\lambda, \ldots$ *para alguna* $\lambda > 0$ *entera.*

Definición 37.8.23 *Una modificación medible de un proceso* $\{V(t), t \geq 0\}$*, es una versión de este,* $\{V(t,w)\}$ *conjuntamente medible para* $t \geq 0$ *y para* $w \in S$*,* S *espacio de estados para* $\{V(t), t \geq 0\}$*.*

Teorema 37.8.13 *Sea* $\{V(t), t \geq\}$ *un proceso regenerativo no negativo con modificación medible. Sea* $\mathbb{E}[X] < \infty$*. Entonces el proceso estacionario dado por la ecuación anterior está bien definido y tiene función de distribución independiente de* t*, además*

i)

$$\mathbb{E}[V^*(0)] = \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

ii) Si $\mathbb{E}[V^*(0)] < \infty$*, equivalentemente, si* $\mathbb{E}\left[\int_0^X V(s)\,ds\right] < \infty$*,entonces*

$$\frac{\int_0^t V(s)\,ds}{t} \to \frac{\mathbb{E}\left[\int_0^X V(s)\,ds\right]}{\mathbb{E}[X]}$$

con probabilidad 1 y en media, cuando $t \to \infty$*.*

37.9. Existencia de Tiempos de Regeneración

Un elemento aleatorio en un espacio medible $(E,\mathcal{E})$ en un espacio de probabilidad $(\Omega,\mathcal{F},\mathbb{P})$ a $(E,\mathcal{E})$, es decir, para $A\in\mathcal{E}$, se tiene que $\{Y\in A\}\in\mathcal{F}$, donde $\{Y\in A\}:=\{w\in\Omega:Y(w)\in A\}=:Y^{-1}A$. También se dice que Y está soportado por el espacio de probabilidad $(\Omega,\mathcal{F},\mathbb{P})$ y que Y es un mapeo medible de Ω en E, es decir, es $\mathcal{F}/\mathcal{E}$ medible. Para cada $i\in\mathbb{I}$ sea P_i una medida de probabilidad en un espacio medible $(E_i,\mathcal{E}_i)$. Se define el espacio producto $\otimes_{i\in\mathbb{I}}(E_i,\mathcal{E}_i):=\left(\prod_{i\in\mathbb{I}}E_i,\otimes_{i\in\mathbb{I}}\mathcal{E}_i\right)$, donde $\prod_{i\in\mathbb{I}}E_i$ es el producto cartesiano de los E_i's, y $\otimes_{i\in\mathbb{I}}\mathcal{E}_i$ es la σ-álgebra producto, es decir, es la σ-álgebra más pequeña en $\prod_{i\in\mathbb{I}}E_i$ que hace al i-ésimo mapeo proyección en E_i medible para toda $i\in\mathbb{I}$ es la σ-álgebra inducida por los mapeos proyección.

$$\otimes_{i\in\mathbb{I}}\mathcal{E}_i:=\sigma\left\{\{y:y_i\in A\}:i\in\mathbb{I}\text{ y }A\in\mathcal{E}_i\right\}.$$

Un espacio de probabilidad $\left(\tilde{\Omega},\tilde{\mathcal{F}},\tilde{\mathbb{P}}\right)$ es una extensión de otro espacio de probabilidad $(\Omega,\mathcal{F},\mathbb{P})$ si $\left(\tilde{\Omega},\tilde{\mathcal{F}},\tilde{\mathbb{P}}\right)$ soporta un elemento aleatorio $\xi\in(\Omega,\mathcal{F})$ que tienen a $\mathbb{P}$ como distribución.

Teorema 37.9.1 *Sea $\mathbb{I}$ un conjunto de índices arbitrario. Para cada $i\in\mathbb{I}$ sea P_i una medida de probabilidad en un espacio medible $(E_i,\mathcal{E}_i)$. Entonces existe una única medida de probabilidad $\otimes_{i\in\mathbb{I}}P_i$ en $\otimes_{i\in\mathbb{I}}(E_i,\mathcal{E}_i)$ tal que*

$$\otimes_{i\in\mathbb{I}}P_i\left(y\in\prod_{i\in\mathbb{I}}E_i:y_i\in A_{i_1},\ldots,y_n\in A_{i_n}\right)=P_{i_1}(A_{i_n})\cdots P_{i_n}(A_{i_n})$$

para todos los enteros $n>0$, toda $i_1,\ldots,i_n\in\mathbb{I}$ y todo $A_{i_1}\in\mathcal{E}_{i_1},\ldots,A_{i_n}\in\mathcal{E}_{i_n}$

La medida $\otimes_{i\in\mathbb{I}}P_i$ es llamada la medida producto y $\otimes_{i\in\mathbb{I}}(E_i,\mathcal{E}_i,P_i):=\left(\prod_{i\in\mathbb{I}},E_i,\otimes_{i\in\mathbb{I}}\mathcal{E}_i,\otimes_{i\in\mathbb{I}}P_i\right)$, es llamado espacio de probabilidad producto.

Definición 37.9.1 *Un espacio medible $(E,\mathcal{E})$ es Polaco si existe una métrica en E tal que E es completo. (es decir cada sucesión de Cauchy converge a un límite en E, y separable, E tienen un subconjunto denso numerable, y tal que $\mathcal{E}$ es generado por conjuntos abiertos.)*

Dos espacios medibles $(E,\mathcal{E})$ y $(G,\mathcal{G})$ son Borel equivalentes *isomorfos* si existe una biyección $f:E\to G$ tal que f es $\mathcal{E}/\mathcal{G}$ medible y su inversa f^{-1} es $\mathcal{G}/\mathcal{E}$ medible. La biyección es una equivalencia de Borel. Un espacio medible $(E,\mathcal{E})$ es un *espacio estándar* si es Borel equivalente a $(G,\mathcal{G})$, donde G es un subconjunto de Borel de $[0,1]$ y $\mathcal{G}$ son los subconjuntos de Borel de G. Cualquier espacio Polaco es un espacio estándar. Un proceso estocástico (**PE**) con conjunto de índices $\mathbb{I}$ y espacio de estados $(E,\mathcal{E})$ es una familia $Z=(\mathbb{Z}_s)_{s\in\mathbb{I}}$ donde $\mathbb{Z}_s$ son elementos aleatorios definidos en un espacio de probabilidad común $(\Omega,\mathcal{F},\mathbb{P})$ y todos toman valores en $(E,\mathcal{E})$.

Definición 37.9.2 *Un Proceso Estocástico One-Sided Contiuous Time (**PEOSCT**) es un proceso estocástico con conjunto de índices $\mathbb{I}=[0,\infty)$.*

Sea $\left(E^{\mathbb{I}},\mathcal{E}^{\mathbb{I}}\right)$ denota el espacio producto $\left(E^{\mathbb{I}},\mathcal{E}^{\mathbb{I}}\right):=\otimes_{s\in\mathbb{I}}(E,\mathcal{E})$. Vamos a considerar $\mathbb{Z}$ como un mapeo aleatorio, es decir, como un elemento aleatorio en $\left(E^{\mathbb{I}},\mathcal{E}^{\mathbb{I}}\right)$ definido por $Z(w)=(Z_s(w))_{s\in\mathbb{I}}$ y $w\in\Omega$. La distribución de un proceso estocástico Z es la distribución de Z como un elemento aleatorio en $\left(E^{\mathbb{I}},\mathcal{E}^{\mathbb{I}}\right)$. La distribución de Z esta determinada de manera única por las distribuciones finito dimensionales. En particular cuando Z toma valores reales, es decir, $(E,\mathcal{E})=(\mathbb{R},\mathcal{B})$ las distribuciones finito dimensionales están determinadas por las funciones de distribución finito dimensionales

$$\mathbb{P}(Z_{t_1}\leq x_1,\ldots,Z_{t_n}\leq x_n),x_1,\ldots,x_n\in\mathbb{R},t_1,\ldots,t_n\in\mathbb{I},n\geq 1. \tag{37.9.1}$$

Para espacios polacos $(E, \mathcal{E})$ el Teorema de Consistencia de Kolmogorov asegura que dada una colección de distribuciones finito dimensionales consistentes, siempre existe un proceso estocástico que posee tales distribuciones finito dimensionales. Las trayectorias de Z son las realizaciones $Z(w)$ para $w \in \Omega$ del mapeo aleatorio Z. Algunas restricciones se imponen sobre las trayectorias, por ejemplo que sean continuas por la derecha, o continuas por la derecha con límites por la izquierda, o de manera más general, se pedirá que caigan en algún subconjunto H de $E^{\mathbb{I}}$. En este caso es natural considerar a Z como un elemento aleatorio que no está en $\left(E^{\mathbb{I}}, \mathcal{E}^{\mathbb{I}}\right)$ sino en $(H, \mathcal{H})$, donde $\mathcal{H}$ es la σ-álgebra generada por los mapeos proyección que toman a $z \in H$ a $z_t \in E$ para $t \in \mathbb{I}$. A $\mathcal{H}$ se le conoce como la traza de H en $E^{\mathbb{I}}$, es decir,

$$\mathcal{H} := E^{\mathbb{I}} \cap H := \left\{A \cap H : A \in E^{\mathbb{I}}\right\}. \tag{37.9.2}$$

Z tiene trayectorias con valores en H y cada Z_t es un mapeo medible de $(\Omega, \mathcal{F})$ a $(H, \mathcal{H})$. Cuando se considera un espacio de trayectorias en particular H, al espacio $(H, \mathcal{H})$ se le llama el espacio de trayectorias de Z. La distribución del proceso estocástico Z con espacio de trayectorias $(H, \mathcal{H})$ es la distribución de Z como un elemento aleatorio en $(H, \mathcal{H})$. La distribución, nuevemente, está determinada de manera única por las distribuciones finito dimensionales.

Definición 37.9.3 *Sea Z un PEOSCT con espacio de estados $(E, \mathcal{E})$ y sea T un tiempo aleatorio en $[0, \infty)$. Por Z_T se entiende el mapeo con valores en E definido en Ω en la manera obvia:*

$$Z_T(w) := Z_{T(w)}(w) .w \in \Omega.$$

Definición 37.9.4 *Un PEOSCT Z es Conjuntamente Medible (**CM**) si el mapeo que toma $(w, t) \in \Omega \times [0, \infty)$ a $Z_t(w) \in E$ es $\mathcal{F} \otimes \mathcal{B}[0, \infty) / \mathcal{E}$ medible.*

Un PEOSCT-CM implica que el proceso es medible, dado que Z_T es una composición de dos mapeos continuos: el primero que toma w en $(w, T(w))$ es $\mathcal{F}/\mathcal{F} \otimes \mathcal{B}[0, \infty)$ medible, mientras que el segundo toma $(w, T(w))$ en $Z_{T(w)}(w)$ es $\mathcal{F} \otimes \mathcal{B}[0, \infty) / \mathcal{E}$ medible.

Definición 37.9.5 *Un PEOSCT con espacio de estados $(H, \mathcal{H})$ es Canónicamente Conjuntamente Medible (**CCM**) si el mapeo $(z, t) \in H \times [0, \infty)$ en $Z_t \in E$ es $\mathcal{H} \otimes \mathcal{B}[0, \infty) / \mathcal{E}$ medible.*

Un PEOSCT-CCM implica que el proceso es CM, dado que un PECCM Z es un mapeo de $\Omega \times [0, \infty)$ a E, es la composición de dos mapeos medibles: el primero, toma (w, t) en $(Z(w), t)$ es $\mathcal{F} \otimes \mathcal{B}[0, \infty) / \mathcal{H} \otimes \mathcal{B}[0, \infty)$ medible, y el segundo que toma $(Z(w), t)$ en $Z_t(w)$ es $\mathcal{H} \otimes \mathcal{B}[0, \infty) / \mathcal{E}$ medible. Por tanto CCM es una condición más fuerte que CM.

Definición 37.9.6 *Un conjunto de trayectorias H de un PEOSCT Z, es Internamente Shift-Invariante (**ISI**) si*

$$\left\{(z_{t+s})_{s \in [0, \infty)} : z \in H\right\} = H,\ t \in [0, \infty).$$

Definición 37.9.7 *Dado un PEOSCT-ISI, se define el mapeo-shift θ_t, $t \in [0, \infty)$, de H a H por*

$$\theta_t z = (z_{t+s})_{s \in [0, \infty)},\ z \in H.$$

Definición 37.9.8 *Se dice que un proceso Z es Shift-Medible (**SM**) si Z tiene un conjunto de trayectorias H que es ISI y además el mapeo que toma $(z, t) \in H \times [0, \infty)$ en $\theta_t z \in H$ es $\mathcal{H} \otimes \mathcal{B}[0, \infty) / \mathcal{H}$ medible.*

Un proceso estocástico con conjunto de trayectorias H ISI es SM si y sólo si es CCM. Dado el espacio polaco $(E, \mathcal{E})$ se tiene el conjunto de trayectorias $D_E[0, \infty)$ que es ISI, entonces cumpe con ser CCM. Si G es abierto, podemos cubrirlo por bolas abiertas cuay cerradura este contenida en G, y como G es segundo numerable como subespacio de E, lo podemos cubrir por una cantidad numerable de bolas abiertas. Los procesos estocásticos Z a tiempo discreto con espacio de estados polaco, también tiene un espacio de trayectorias polaco y por tanto tiene distribuciones condicionales regulares.

Teorema 37.9.2 *El producto numerable de espacios polacos es polaco.*

Definición 37.9.9 *Sea $(\Omega, \mathcal{F}, \mathbb{P})$ espacio de probabilidad que soporta al proceso $Z = (Z_s)_{s \in [0, \infty)}$ y $S = (S_k)_0^\infty$ donde Z es un PEOSCTM con espacio de estados $(E, \mathcal{E})$ y espacio de trayectorias $(H, \mathcal{H})$ y además S es una sucesión de tiempos aleatorios one-sided que satisfacen la condición $0 \leq S_0 < S_1 < \cdots \to \infty$. Considerando S como un mapeo medible de $(\Omega, \mathcal{F})$ al espacio sucesión $(L, \mathcal{L})$, donde*

$$L = \left\{(s_k)_0^\infty \in [0, \infty)^{\{0,1,\ldots\}} : s_0 < s_1 < \cdots \to \infty\right\},$$

donde $\mathcal{L}$ son los subconjuntos de Borel de L, es decir, $\mathcal{L} = L \cap \mathcal{B}^{\{0,1,\ldots\}}$.

Así el par (Z, S) es un mapeo medible de $(\Omega, \mathcal{F})$ en $(H \times L, \mathcal{H} \otimes \mathcal{L})$. El par $\mathcal{H} \otimes \mathcal{L}^+$ denotará la clase de todas las funciones medibles de $(H \times L, \mathcal{H} \otimes \mathcal{L})$ en $([0, \infty), \mathcal{B}[0, \infty))$.

Definición 37.9.10 *Sea θ_t el mapeo-shift conjunto de $H \times L$ en $H \times L$ dado por*

$$\theta_t\left(z,(s_k)_0^\infty\right) = \theta_t\left(z,\left(s_{n_{t-}+k}-t\right)_0^\infty\right)$$

donde $n_{t-} = inf\{n \geq 1 : s_n \geq t\}$.

Con la finalidad de poder realizar los shift's sin complicaciones de medibilidad, se supondrá que Z es shit-medible, es decir, el conjunto de trayectorias H es invariante bajo shifts del tiempo y el mapeo que toma $(z,t) \in H \times [0,\infty)$ en $z_t \in E$ es $\mathcal{H} \otimes \mathcal{B}[0,\infty)/\mathcal{E}$ medible.

Definición 37.9.11 *Dado un proceso **PEOSSM** (Proceso Estocástico One Side Shift Medible) Z, se dice regenerativo clásico con tiempos de regeneración S si*

$$\theta_{S_n}(Z,S) = \left(Z^0,S^0\right), n \geq 0$$

y además $\theta_{S_n}(Z,S)$ es independiente de $((Z_s)\, s \in [0,S_n), S_0,\ldots,S_n)$ Si lo anterior se cumple, al par (Z,S) se le llama regenerativo clásico.

Si el par (Z,S) es regenerativo clásico, entonces las longitudes de los ciclos $X_1, X_2, \ldots,$ son i.i.d. e independientes de la longitud del retraso S_0, es decir, S es un proceso de renovación. Las longitudes de los ciclos también son llamados tiempos de inter-regeneración y tiempos de ocurrencia.

Teorema 37.9.3 *Supóngase que el par (Z,S) es regenerativo clásico con $\mathbb{E}[X_1] < \infty$. Entonces (Z^*,S^*) en el teorema 2.1 es una versión estacionaria de (Z,S). Además, si X_1 es lattice con span d, entonces (Z^{**},S^{**}) en el teorema 2.2 es una versión periodicamente estacionaria de (Z,S) con periodo d.*

Definición 37.9.12 *Una variable aleatoria X_1 es spread out si existe una $n \geq 1$ y una función $f \in \mathcal{B}^+$ tal que $\int_{\mathbb{R}} f(x)\,dx > 0$ con $X_2, X_3, \ldots, X_n$ copias i.i.d de X_1,*

$$\mathbb{P}(X_1 + \cdots + X_n \in B) \geq \int_B f(x)\,dx$$

para $B \in \mathcal{B}$.

Definición 37.9.13 *Dado un proceso estocástico Z se le llama Wide-Sense Regenerative (**WSR**) con tiempos de regeneración S si $\theta_{S_n}(Z,S) = \left(Z^0,S^0\right)$ para $n \geq 0$ en distribución y $\theta_{S_n}(Z,S)$ es independiente de $(S_0,S_1,\ldots,S_n)$ para $n \geq 0$. Se dice que el par (Z,S) es WSR si lo anterior se cumple.*

El proceso de trayectorias $(\theta_s Z)_{s\in[0,\infty)}$ es WSR con tiempos de regeneración S pero no es regenerativo clásico. Si Z es cualquier proceso estacionario y S es un proceso de renovación que es independiente de Z, entonces (Z,S) es WSR pero en general no es regenerativo clásico. Para cualquier proceso estocástico Z, el proceso de trayectorias $(\theta_s Z)_{s\in[0,\infty)}$ es siempre un proceso de Markov.

Teorema 37.9.4 *Supongase que el par (Z,S) es WSR con $\mathbb{E}[X_1] < \infty$. Entonces (Z^*,S^*) en el teorema 2.1 es una versión estacionaria de (Z,S).*

Teorema 37.9.5 *Supongase que (Z,S) es cycle-stationary con $\mathbb{E}[X_1] < \infty$. Sea U distribuida uniformemente en $[0,1)$ e independiente de $\left(Z^0,S^0\right)$ y sea $\mathbb{P}^*$ la medida de probabilidad en $(\Omega,\mathbb{P})$ definida por*

$$d\mathbb{P}^* = \frac{X_1}{\mathbb{E}[X_1]} d\mathbb{P}$$

. Sea (Z^*,S^*) con distribución $\mathbb{P}^*\left(\theta_{UX_1}\left(Z^0,S^0\right) \in \cdot\right)$. Entonces $(Z*,S^*)$ es estacionario,

$$\mathbb{E}[f(Z^*,S^*)] = \mathbb{E}\left[\int_0^{X_1} f\left(\theta_s\left(Z^0,S^0\right)\right) ds\right] / \mathbb{E}[X_1]$$

$f \in \mathcal{H} \otimes \mathcal{L}^+$, and S_0^* es continuo con función distribución G_∞ definida por

$$G_\infty(x) := \frac{\mathbb{E}[X_1] \wedge x}{\mathbb{E}[X_1]}$$

para $x \geq 0$ y densidad $\mathbb{P}[X_1 > x]/\mathbb{E}[X_1]$, con $x \geq 0$.

Teorema 37.9.6 *Sea Z un Proceso Estocástico un lado shift-medible one-sided shift-measurable stochastic process, (PEOSSM), y S_0 y S_1 tiempos aleatorios tales que $0 \leq S_0 < S_1$ y*

$$\theta_{S_1} Z = \theta_{S_0} Z \text{ en distribución.} \tag{37.9.3}$$

Entonces el espacio de probabilidad subyacente $(\Omega,\mathcal{F},\mathbb{P})$ puede extenderse para soportar una sucesión de tiempos aleatorios S tales que

$$\theta_{S_n}(Z,S) = \left(Z^0,S^0\right), n \geq 0, \text{ en distribución,} \tag{37.9.4}$$

$$(Z,S_0,S_1) \text{ depende de } (X_2,X_3,\ldots) \text{ solamente a traves de } \theta_{S_1} Z. \tag{37.9.5}$$

37.10. Main Theorem: Article

The authors are interested in determining the means of the queue lengths at any time, for the exhaustive policy. For this purpose, it is necessary to make assumptions over the processes involved in order to guarantee the stationarity of the queue lengths processes in the NCPS.

Supuestos 37.10.1 *(i) Each of the queues of the NCPS is an $M/M/1$ system, with $\tilde{\rho}_i := \tilde{\mu}_i/\lambda_i < 1$, for $i = 1,2,3,4$ (observe that in the case considered $\tilde{\rho}_i = \tilde{\mu}_i$, for $i = 1,2,3,4$, given that the service time is assumed to be proportional to the length of the slot).*

(ii) The switchover times have a finite first moment.

Observación 37.10.1 *In [16] conditions are given which guarantee that the $M/M/1$ system has a renewal departure process (see Theorem 3.4 (4) in this reference). This will be used in the proofs of Theorems 37.10.1 and 37.10.2.*

Consider the processes $\mathbb{L}(t) = (L_1(t), L_2(t), L_3(t), L_4(t)), \mathbb{B}(t) = (B_1(t), B_2(t), \ B_3(t), B_4(t)), \mathbb{K}(t) = (K_1(t), K_2(t), K_3(t), K_4(t$ and $\mathbb{V}(t) = (V_1(t), V_2(t), V_3(t), \ V_4(t))$, $t \geq 0$, for the queue lengths, switchover times, service times and polling instants, respectively. Associated to the queue length processes, the state spaces $\mathbb{D}_i = \{0,1,2,\ldots,\}$ and $\mathcal{D}_i = \mathcal{P}(\mathbb{D}_i)$, are considered, where $\mathcal{P}(\mathbb{D}_i)$ is the class of all subsets of $\mathbb{D}_i$, for $i = 1,2,3,4$. For the following processes: switchover times, service times, and polling instants, consider the state space $\mathbb{G} = [0,\infty)$ with $\mathcal{G} = \mathcal{B}(\mathbb{G})$, where $\mathcal{B}(\mathbb{G})$ is the Borel σ-algebra generated by the open subsets of $\mathbb{G}$. Then the general process

$$\mathbb{W}(t) = (\mathbb{L}(t), \mathbb{B}(t), \mathbb{K}(t), \mathbb{V}(t)), \ t > 0,$$

is obtained, with state spaces $\Xi = \mathbb{D}_i^4 \times \mathbb{G}^{12}$ and $\Im = \mathcal{B}(\Xi)$. In the sequel, the random variables taken into account are supposed to be defined in the measurable space $(\Xi, \Im)$. For a random variable η, $\eta[\Xi] := \{\eta(t) : t \geq 0\}$ will be denoted. Besides, the following events for the arrival processes will be defined for some $t \geq 0$ and queue Q_i in the NCPS: $A_i(t) = \{0 \text{ arrivals on } Q_i \text{ at time } t\}$, for $i = 1,2,3,4$.

Teorema 37.10.1 *Suppose that Assumption 1 holds. Given an NCPS, there exists a random variable T^*, such that*

$$\mathbb{P}\{A_1(T^*) \cap A_2(T^*) \cap A_3(T^*) \cap A_4(T^*) | T^* = t^*\} > 0, \ t^* \in T^*[\Xi]$$

is satisfied.

Demostración 37.10.1 *The proof is divided into four steps given from a) to d).*

a) In this incise it is going to be proved that both queues of system Γ_1 become empty at certain time.

The index $j = 1,2,3,\ldots$, is used to denote the cycle when the server of system Γ_1 visits a queue. Denote its switchover times by $r_1(j)$ and by $r_2(j)$, and its service times by $K_1(j)$, $K_2(j)$, for the queues Q_1 and Q_2, respectively.

It is also necessary to define appropriate random variables which are going to help calculating the joint probability for the events $A_1(t)$ and $A_2(t)$ for certain times $\tilde{t} > 0$. When the server arrives to the queue Q_1, at $t = 0$, $\tau_1(1) = 0$, there are no users in the queue, so that $K_1(1) = 0$, therefore $\overline{\tau}_1(1) = \tau_1(1) = 0$. Then the server moves to Q_2 according to the random variable $r_1(1)$ so that the arrival time to queue Q_2 is given by $\tau_2(1) = r_1(1)$.

There are two possible situations when the server arrives to Q_2: the queue is empty or not. This means that $K_2(1)$ could be equal or greater than 0. Here the authors just present the case when $K_2(1) > 0$; the proof when $K_2(1) = 0$ is similar to the case of $K_2(1) > 0$. Suppose $K_2(1) > 0$, then

$$\overline{\tau}_2(1) = \tau_2(1) + K_2(1),$$

consequently the server moves to Q_1 incurring in a switchover time $r_2(1)$, so that

$$\tau_1(2) = \overline{\tau}_2(1) + r_2(1).$$

For $\tau_1(2)$ there are two possibilities: Q_1 is still empty or not. This means that $K_1(2) = 0$ or $K_1(2) > 0$, therefore $\overline{\tau}_1(2) = \tau_1(2)$ or $\overline{\tau}_1(2) = \tau_1(2) + K_1(2)$. In both cases

$$\tau_2(2) = \overline{\tau}_1(2) + r_1(2).$$

If $K_1(2)$ is not equal to zero, it is necessary to consider the period of time when it is possible to guarantee that both queues are empty at the same time. If $K_1(1) = K_2(1) = K_1(2) = K_2(2) = 0$, the calculations are simple, then it is supposed that they are not equal to zero. Let α be fixed with $\alpha \in [0,1]$. Consider the random variables

$$T_1 = (1-\alpha)\overline{\tau}_1(2) + \alpha\tau_2(2), \quad T_2 = (1-\alpha)\overline{\tau}_2(1) + \alpha\tau_2(2). \tag{37.10.1}$$

For $t_1 \in T_1[\Xi]$ and $t_2 \in T_2[\Xi]$, it is obtained that

$$\mathbb{P}\{A_1(T_1) | T_1 = t_1\} = e^{-\tilde{\mu}_1 t_1}, \text{ and } \quad \mathbb{P}\{A_2(T_2) | T_2 = t_2\} = e^{-\tilde{\mu}_2 t_2}. \tag{37.10.2}$$

By construction it is gotten that $T_1[\Xi] \subseteq T_2[\Xi]$, *therefore* $T_1[\Xi] \cap T_2[\Xi] = T_1[\Xi] \subseteq T_2[\Xi]$, *so that, if* $\tilde{t} \in T_1[\Xi] \cap T_2[\Xi]$ *is considered, then*

$$\mathbb{P}\left\{A_2(T_1)\,|T_1 = \tilde{t}\right\} \geq \mathbb{P}\left\{A_2(T_2)\,|T_2 = \tilde{t}\right\}.$$

Therefore the joint probability is given by

$$\begin{aligned}\mathbb{P}\left\{A_1(T_1) \cap A_2(T_1)\,|T_1 = \tilde{t}\right\} &= \mathbb{P}\left\{A_1(T_1)\,|T_1 = \tilde{t}\right\}\mathbb{P}\left\{A_2(T_1)\,|T_1 = \tilde{t}\right\} \\ &\geq \mathbb{P}\left\{A_1(T_1)\,|T_1 = \tilde{t}\right\}\mathbb{P}\left\{A_2(T_2)\,|T_2 = \tilde{t}\right\} \\ &= e^{-\tilde{\mu}_1\tilde{t}}e^{-\tilde{\mu}_2\tilde{t}} = e^{-(\tilde{\mu}_1+\tilde{\mu}_2)\tilde{t}} > 0.\end{aligned}$$

(Note that events $A_1(t)$ *and* $A_2(t)$ *are conditionally independent under* T_1*.) Hence,*

$$\mathbb{P}\left\{A_1(T_1) \cap A_2(T_1)\,|T_1 = \tilde{t}\right\} > 0, \text{ for } \tilde{t} \in T_1[\Xi] \cap T_2[\Xi]. \tag{37.10.3}$$

b) *Now it will be demonstrated that for the time of departure of the server in system* Γ_1 *it is always possible to find a cycle such that the server in system* Γ_2 *has just finished to attend one of the queues. So let us prove that for* $\tau_2(2)$ *there exists an* $n \geq 1$ *such that one of the following inequalities is satisfied:*

$$\begin{aligned}&a)\ \tau_3(n) < \tau_2(2) < \overline{\tau}_3(n), \quad b)\ \overline{\tau}_3(n) < \tau_2(2) < \tau_4(n), \\ &c)\ \tau_4(n) < \tau_2(2) < \overline{\tau}_4(n), \quad d)\ \overline{\tau}_4(n) < \tau_2(2) < \tau_3(n+1).\end{aligned} \tag{37.10.4}$$

The authors only give the proof for the case a); the proofs for the rest of the cases are similar. Suppose that for all $n \geq 1$, $\tau_2(2) \leq \overline{\tau}_3(n)$ *or* $\overline{\tau}_3(n) \leq \tau_2(2)$. *Consider* $\tau_3(n) = 0$ *and* $\tau_2(2) > 0$, *with* $\overline{\tau}_3(n) \leq \tau_2(2)$ *for all* $n \geq 1$ *(the proof of the case* $\tau_2(2) \leq \overline{\tau}_3(n)$ *is analogous). It implies that all arrivals take place before* $\tau_2(2)$, *but this is not possible. Hence, case a) holds.*

c) *In this part two random variables will be constructed for the system* Γ_2 *such that it will be possible to determine the joint probability for the events* $A_3(t)$ *and* $A_4(t)$ *for certain times* $\hat{t}$. *Without loss of generality, consider that* $\tau_3(n) < \tau_2(2) < \overline{\tau}_3(n)$ *for* n *whose existence is guaranteed in (b), and define the random variables*

$$\begin{aligned}T_3 &= (1-\alpha)\,\tau_3(n-1) + \alpha\overline{\tau}_3(n) \text{ and} \\ T_4 &= (1-\alpha)\,\overline{\tau}_4(n-1) + \alpha\overline{\tau}_3(n).\end{aligned} \tag{37.10.5}$$

Again, as above, for $\hat{t} \in T_3[\Xi] \cap T_4[\Xi]$, *the joint probability is given by*

$$\begin{aligned}\mathbb{P}\left\{A_3(T_4) \cap A_4(T_4)\,|T_4 = \hat{t}\right\} &\geq \mathbb{P}\left\{A_3(T_3)\,|T_3 = \hat{t}\right\} \cdot \mathbb{P}\left\{A_4(T_4)\,|T_4 = \hat{t}\right\} \\ &= e^{-(\tilde{\mu}_3+\tilde{\mu}_4)\hat{t}} > 0.\end{aligned}$$

d) *Finally, with the random variables* T_1, T_2, T_3, *and* T_4, *a new random variable* T^* *is constructed, such that all the queues of both systems become empty for* T^*. *For* n, *whose existence is guaranteed in (b), let*

$$T^+ := \overline{\tau}_3(n), \text{ and } \quad T^- := \min\{\overline{\tau}_2(1), \overline{\tau}_3(n-1)\} \tag{37.10.6}$$

and observe that

$$T^-[\Xi] \subset T_i[\Xi] \subset T^+[\Xi], \text{ for } i = 1,2,3,4.$$

Define the random variable

$$T^* := (1-\alpha)\,T^- + \alpha T^+, \tag{37.10.7}$$

such that for all $i = 1,2,3,4$, *it satisfies that* $T^*[\Xi] \subset T_i[\Xi]$, *so* $T^*[\Xi] \subset \cap_{i=1}^4 T_i[\Xi]$. *This implies that*

$$\mathbb{P}\left\{A_i(T^*)\,|T^* = t^*\right\} \geq \mathbb{P}\left\{A_i(T_i)\,|T_i = t^*\right\} = e^{-\tilde{\mu}_i t^*} > 0, \text{ for } t^* \in T^*[\Xi]. \tag{37.10.8}$$

This means that for $t^* \in T^*[\Xi]$ *there are no arrivals to the queues* Q_1 *and* Q_2, *it results that there are no transfer users from* Q_3 *and* Q_4, *so* $\tilde{\mu}_1 = \mu_1$, $\tilde{\mu}_2 = \mu_2$, $\tilde{\mu}_3 = \mu_3$, *and* $\tilde{\mu}_4 = \mu_4$. *Consequently the events* $A_1(T^*)$ *and* $A_3(T^*)$ *are conditionally independent for* T^**; the same argument can be applied for the events* $A_2(T^*)$ *and* $A_4(T^*)$. *Therefore, it follows that*

$$\begin{aligned}&\mathbb{P}\left\{A_1(T^*) \cap A_2(T^*) \cap A_3(T^*) \cap A_4(T^*)\,|T^* = t^*\right\} \geq \textstyle\prod_{i=1}^4 \mathbb{P}\left\{A_i(T_i)\,|T_i = t_i\right\} \\ &= \textstyle\prod_{i=1}^4 e^{-\mu_i t_i} = e^{-\sum_{i=1}^4 \mu_i t_i} > 0, \text{ for } t^* \in T^*[\Xi].\end{aligned} \tag{37.10.9}$$

Observación 37.10.2 *Note that it is easy to prove that* T^* *has a finite first moment. This is a consequence of the fact that each of the variables involved in the definition of* T^* *has a finite first moment, given that each of the queues in the NCPS is an* $M/M/1$ *system.*

Now, the stationarity of the stochastic process related to the NCPS will be proved. Definitions very close to the ones given in Chapters 2, 3, 4, and 10 in Thorisson [45] with respect to the stationarity of regenerative processes will be followed. Consider the processes $\mathbb{L}(t) = (L_1(t), L_2(t), L_3(t), L_4(t))$, $t \geq 0$, defined previously. Observe that the process $\mathbb{L}(t)$, $t \geq 0$, takes values in the product space given by

$$\left(\mathbf{E}, \tilde{\mathcal{E}}\right) = \left(\prod_{i=1}^4 D_i, \prod_{i=1}^4 \mathcal{D}_i\right),$$

which also results to be a polish space, and $\tilde{\mathcal{E}}$ is the corresponding product σ-algebra.

Teorema 37.10.2 *Given the stochastic process $\mathbb{L}(t)$, $t \geq 0$, there is an infinite sequence of regeneration times $\Phi_n, n \geq 0$ defined on $(\Xi, \Im)$, such that for $\phi_n \in \Phi_n[\Xi]$,*

$$\mathbb{L}(\phi_n) = (L_1(\phi_n), L_2(\phi_n), L_3(\phi_n), L_4(\phi_n)) = (0,0,0,0), n \geq 0. \tag{37.10.10}$$

Furthermore, there exists a stationary version of the process $\mathbb{L}(t)$, $t \geq 0$.

Demostración 37.10.2 *Suppose that the process $\mathbf{L} = \{\mathbb{L}(t), t \geq 0\}$ has been constructed in a canonical way on a probability space $\left(\overline{\Omega}, \overline{\mathcal{F}}, \overline{\mathbb{P}}\right)$. Given that the queue length processes $\mathbb{L}(t)$, $t \geq 0$ are counting processes, it follows that they have right continuous paths with left hand limits. Hence, it is obtained that the process $\mathbf{L}$ is a continuous time one sided process, with path set $H := D_{\mathbf{E}}[0,\infty)$, where $D_{\mathbf{E}}[0,\infty)$ is the set of right continuous maps from $[0,\infty)$ to $\mathbf{E}$ with left hand limits (see Section 2.1, p. 126 in [45]).*

According to the second paragraph, Section 2.8, p. 131 in [45], the path set H is internally shift-invariant and therefore canonically jointly measurable. By Section 2.7, p. 130 in [45], the stochastic process $\mathbf{L}$ is shift-measurable.

Hence, by Theorem 37.10.1 it is obtained that the hypothesis of Theorem 4.5, p. 362 in [45] are satisfied, so that the underlying probability space $\left(\overline{\Omega}, \overline{\mathcal{F}}, \overline{\mathbb{P}}\right)$ can be extended to support a sequence of random times $\{\Phi_n : n \geq 1\}$ such that the stochastic process regenerates in these points. In the case discussed here, each of the queues becomes empty at $\phi_n \in \Phi_n[\Xi]$.

Finally, by Remark 37.10.2 and Definition 3.1, p. 346 in [45] (in fact, comparing the equations (3.1) and (3.2) with equations (4.6) and (4.7) in Theorem 4.5, p. 362 in [45]), it is gotten that the stochastic process $\mathbf{L}$ is classical regenerative with finite first moment for the cycle lengths, therefore it is possible to apply Theorem 3.1, p. 348 in [45], in order to obtain that there exists a stationary version of the stochastic processes $\mathbf{L}$ and $\{\Phi_n : n \geq 0\}$ satisfies (37.10.10).

Now, the probability generating functions that model the NCPS will be determined to calculate the expected queue lengths at any time.

In this section it is supposed that Assumption 37.10.1 holds. Here, the idea given in [42] is followed, in order to find the expected queue lengths at any time for the NCPS.

Fix $i \in \{1,2,3,4\}$. Let L_i^* be the number of users at queue Q_i at polling instants, then, following Section **??**, it is obtained that

$$\mathbb{E}\left[L_i^*\right] = f_i(i), \quad Var\left[L_i^*\right] = \mathbf{f}_i(i,i) + \mathbb{E}\left[L_i^*\right] - \mathbb{E}\left[L_i^*\right]^2. \tag{37.10.11}$$

Consider the cycle time C_i for the queue Q_i with duration given by $\tau_i(m+1) - \tau_i(m)$ for $m \geq 1$. The intervisit time I_i of the queue Q_i is defined as the period beginning at the time the server leaves Q_i in a cycle and ends at the time when the queue Q_i is polled in the next cycle; its duration is given by $\tau_i(m+1) - \overline{\tau}_i(m)$. The interval between two successive regeneration points will be called regenerative cycle. Observe that Theorem 37.10.2 guarantees its existence. Let M_i be the number of polling cycles in a regenerative cycle. The duration of the m-th polling cycle in a regeneration cycle will be denoted by $C_i^{(m)}$, for $m = 1, 2, \ldots, M_i$. The mean polling cycle time is defined by

$$\mathbb{E}[C_i] = \frac{\sum_{m=1}^{M_i} \mathbb{E}\left[C_i^{(m)}\right]}{\mathbb{E}[M_i]}. \tag{37.10.12}$$

Again, note that Theorem 37.10.2 guarantees that all the terms in the right-hand side of (37.10.12) are well defined. For the process $L_i(t)$, $t \geq 0$, their PGF will be denoted by $\mathcal{Q}_i(z)$, $z \in \mathbb{C}$, which is also given by the time average of $z^{L_i(t)}$ over the regenerative cycle defined before, so it is obtained that

$$\mathcal{Q}_i(z) \quad = \quad \mathbb{E}\left[z^{L_i(t)}\right] = \frac{\mathbb{E}\left[\sum_{m=1}^{M_i} \sum_{t=\tau_i(m)}^{\tau_i(m+1)-1} z^{L_i(t)}\right]}{\mathbb{E}\left[\sum_{m=1}^{M_i} (\tau_i(m+1) - \tau_i(m))\right]}, \tag{37.10.13}$$

which can be rewritten in the form

$$\mathcal{Q}_i(z) = \frac{1}{\mathbb{E}[C_i]} \cdot \frac{1 - F_i(z)}{P_i(z) - z} \cdot \frac{(1-z) P_i(z)}{1 - P_i(z)}, \tag{37.10.14}$$

(see Section 3 in [42]). The following proposition provides the expected queue lengths for each of the queues in the NCPS at any time.

Teorema 37.10.3 *For the queue lengths in the NCPS at any time, with PGF given in (37.10.14), the first and second order moments are given by*

$$\mathcal{Q}_i^{(1)}(1) = \frac{1}{\tilde{\mu}_i(1-\tilde{\mu}_i)} \frac{\mathbb{E}(L_i^*)^2}{2\mathbb{E}[C_i]} - \sigma_i^2 \frac{\mathbb{E}\left[L_i^*\right]}{2\mathbb{E}[C_i]} \cdot \frac{1 - 2\tilde{\mu}_i}{(1-\tilde{\mu}_i)^2 \tilde{\mu}_i^2}, \tag{37.10.15}$$

where $\sigma_i^2 = \left(Var\left[\tilde{X}_i(t)\right]\right)^2$, and

$$\begin{aligned}
&\mathbb{E}[C_i]\, \mathcal{Q}_i^{(2)}(1) = \tfrac{1}{\tilde{\mu}_i^3 (1-\tilde{\mu}_i)^3} \Big\{ -(1-\tilde{\mu}_i)^2 \tilde{\mu}_i^2 O_{1,i}^{(2)}(1) \\
&- \tilde{\mu}_i (1-\tilde{\mu}_i)(1-2\tilde{\mu}_i) O_{1,i}(1) O_{3,i}^{(2)}(1) - \tilde{\mu}_i^2 (1-\tilde{\mu}_i)^2 O_{1,i}(1) P_i^{(2)}(1) \\
&+ 2\tilde{\mu}_i \left[(1-2\tilde{\mu}_i) O_{1,i}(1) - (1-\tilde{\mu}_i)\right] \left(O_{3,i}^{(1)}(1)\right)^2 \\
&- 2(1-\tilde{\mu}_i)(1-2\tilde{\mu}_i) O_{1,i}(1) O_{3,i}^{(1)}(1) - 2\tilde{\mu}_i^3 (1-\tilde{\mu}_i)^2 O_{1,i}^{(1)}(1) \\
&- 2(1-2\tilde{\mu}_i) O_{3,i}^{(1)}(1) O_{1,i}^{(1)}(1) - 2\tilde{\mu}_i^2 (1-\tilde{\mu}_i)(1-2\tilde{\mu}_i) O_{1,i}(1) O_{1,i}^{(1)}(1) \Big\},
\end{aligned} \tag{37.10.16}$$

for $i = 1, 2, 3, 4$.

Demostración 37.10.3 *Fix $i \in \{1,2,3,4\}$ and $z \in \mathbb{C}$. To remove the singularities in (37.10.14) it is necessary to define the following analytic functions:*

$$\varphi_i(z) = 1 - F_i(z), \quad \psi_i(z) = z - P_i(z), \quad \text{and } \varsigma_i(z) = 1 - P_i(z), \tag{37.10.17}$$

then

$$\mathbb{E}[C_i]\,\mathcal{Q}_i(z) = \frac{(z-1)\,\varphi_i(z)\,P_i(z)}{\psi_i(z)\,\varsigma_i(z)}. \tag{37.10.18}$$

For $k \geq 0$, define $a_k = P\left\{L_i^*(t) = k\right\}$. It is obtained that

$$\varphi_i(z) = 1 - F_i(z) = 1 - \sum_{k=0}^{+\infty} a_k z^k,$$

therefore

$$\begin{aligned}
\varphi_i^{(1)}(z) &= -\sum_{k=1}^{+\infty} k a_k z^{k-1}, \text{ with } \varphi_i^{(1)}(1) = -\mathbb{E}\left[L_i^*(t)\right], \text{ and} \\
\varphi_i^{(2)}(z) &= -\sum_{k=2}^{+\infty} k(k-1) a_k z^{k-2}, \text{ hence } \varphi_i^{(2)}(1) = \mathbb{E}\left[L_i^*\left(L_i^*-1\right)\right].
\end{aligned}$$

In the same way it is gotten that

$$\varphi_i^{(3)}(z) = -\sum_{k=3}^{+\infty} k(k-1)(k-2) a_k z^{k-3} \text{ and } \varphi_i^{(3)}(1) = -\mathbb{E}\left[L_i^*\left(L_i^*-1\right)\left(L_i^*-2\right)\right].$$

Expanding $\varphi_i(z)$ around $z = 1$,

$$\begin{aligned}
\varphi_i(z) &= \varphi_i(1) + \frac{\varphi_i^{(1)}(1)}{1!}(z-1) + \frac{\varphi_i^{(2)}(1)}{2!}(z-1)^2 + \frac{\varphi^{(3)}(1)}{3!}(z-1)^3 + \ldots + \\
&= (z-1)\left\{\varphi_i^{(1)}(1) + \frac{\varphi^{(2)}(1)}{2!}(z-1) + \frac{\varphi_i^{(3)}(1)}{3!}(z-1)^2 + \ldots + \right\} = (z-1)\,O_{1,i}(z)
\end{aligned}$$

with $O_{1,i}(z) \neq 0$, given that $O_{1,i}(z) = -\mathbb{E}\left[L_i^*\right]$, where

$$O_{1,i}(z) = \varphi_i^{(1)}(1) + \frac{\varphi_i^{(2)}(1)}{2!}(z-1) + \frac{\varphi_i^{(3)}(1)}{3!}(z-1)^2 + \ldots + . \tag{37.10.19}$$

Calculating the derivatives of $O_{1,i}(z)$, and evaluating in $z = 1$, it is obtained that

$$\begin{aligned}
O_{1,i}(1) &= -\mathbb{E}\left[L_i^*\right], \; O_{1,i}^{(1)}(1) = -\frac{1}{2}\mathbb{E}\left[(L_i^*)^2\right] + \frac{1}{2}\mathbb{E}\left[L_i^*\right] \\
\text{and } O_{1,i}^{(2)}(1) &= -\frac{1}{3}\mathbb{E}\left[(L_i^*)^3\right] + \mathbb{E}\left[(L_i^*)^2\right] - \frac{2}{3}\mathbb{E}\left[L_i^*\right].
\end{aligned}$$

Proceeding in a similar manner for $\psi_i(z) = z - P_i(z)$ and $\varsigma_i(z) = 1 - P_i(z)$, it is gotten that

$$\mathbb{E}[C_i]\,Q_i(z) = \frac{O_{1,i}(z)\,P_i(z)}{O_{2,i}(z)\,O_{3,i}(z)}. \tag{37.10.20}$$

Calculating the derivative with respect to z, and evaluating in $z = 1$,

$$\begin{aligned}
\mathbb{E}[C_i]\,\mathcal{Q}_i^{(1)}(1) &= \frac{1}{(1-\tilde{\mu}_i)^2\,\tilde{\mu}_i^2}\left\{\left(-\frac{1}{2}\mathbb{E}\left[(L_i^*)^2\right] + \frac{1}{2}\mathbb{E}\left[L_i^*\right]\right)(1-\tilde{\mu}_i)(-\tilde{\mu}_i)\right. \\
&+ (-\mathbb{E}\left[L_i^*\right])(1-\tilde{\mu}_i)(-\tilde{\mu}_i)\,\tilde{\mu}_i - \left(-\frac{1}{2}\mathbb{E}\left[\tilde{X}_i^2(t)\right] + \frac{1}{2}\tilde{\mu}_i\right)(-\tilde{\mu}_i)(-\mathbb{E}\left[L_i^*\right]) \\
&\left.- (1-\tilde{\mu}_i)(-\mathbb{E}\left[L_i^*\right])\left(-\frac{1}{2}\mathbb{E}\left[\tilde{X}_i^2(t)\right] + \frac{1}{2}\tilde{\mu}_i\right)\right\} \\
&= \frac{1}{(1-\tilde{\mu}_i)^2\,\tilde{\mu}_i^2}\left\{-\frac{1}{2}\tilde{\mu}_i^2\mathbb{E}\left[(L_i^*)^2\right] + \frac{1}{2}\tilde{\mu}_i\mathbb{E}\left[(L_i^*)^2\right] + \frac{1}{2}\tilde{\mu}_i^2\mathbb{E}\left[L_i^*\right] - \tilde{\mu}_i^3\mathbb{E}\left[L_i^*\right]\right. \\
&\left.+ \tilde{\mu}_i\mathbb{E}\left[L_i^*\right]\mathbb{E}\left[\tilde{X}_i^2(t)\right] - \frac{1}{2}\mathbb{E}\left[L_i^*\right]\mathbb{E}\left[\tilde{X}_i^2(t)\right]\right\} \\
&= \frac{1}{2\tilde{\mu}_i(1-\tilde{\mu}_i)}\mathbb{E}\left[(L_i^*)^2\right] - \frac{\frac{1}{2}-\tilde{\mu}_i}{(1-\tilde{\mu}_i)^2\,\tilde{\mu}_i^2}\sigma_i^2\mathbb{E}\left[L_i^*\right].
\end{aligned}$$

It means that

$$\mathcal{Q}_i^{(1)}(1) = \frac{1}{\tilde{\mu}_i(1-\tilde{\mu}_i)}\frac{\mathbb{E}\left[(L_i^*)^2\right]}{2\mathbb{E}[C_i]} - \sigma_i^2\frac{\mathbb{E}L_i^*}{2\mathbb{E}[C_i]}\cdot\frac{1-2\tilde{\mu}_i}{(1-\tilde{\mu}_i)^2\,\tilde{\mu}_i^2}.$$

Deriving again and evaluating in $z = 1$, it follows that

$$\begin{aligned}
\mathbb{E}\left[C_i\right] \mathcal{Q}_i^{(2)}(1) &= \frac{1}{\tilde{\mu}_i^3 (1-\tilde{\mu}_i)^3} \Big\{ -(1-\tilde{\mu}_i)^2 \tilde{\mu}_i^2 O_{1,i}^{(2)}(1) \\
&- \tilde{\mu}_i (1-\tilde{\mu}_i)(1-2\tilde{\mu}_i) O_{1,i}(1) O_{3,i}^{(2)}(1) - \tilde{\mu}_i^2 (1-\tilde{\mu}_i)^2 O_{1,i}(1) P_i^{(2)}(1) \\
&+ 2\tilde{\mu}_i \left[(1-2\tilde{\mu}_i) O_{1,i}(1) - (1-\tilde{\mu}_i)\right] \left(O_{3,i}^{(1)}(1)\right)^2 \\
&- 2(1-\tilde{\mu}_i)(1-2\tilde{\mu}_i) O_{1,i}(1) O_{3,i}^{(1)}(1) - 2\tilde{\mu}_i^3 (1-\tilde{\mu}_i)^2 O_{1,i}^{(1)}(1) \\
&- 2(1-2\tilde{\mu}_i) O_{3,i}^{(1)}(1) O_{1,i}^{(1)}(1) - 2\tilde{\mu}_i^2 (1-\tilde{\mu}_i)(1-2\tilde{\mu}_i) O_{1,i}(1) O_{1,i}^{(1)}(1) \Big\},
\end{aligned}$$

where $O_{1,i}(1), O_{1,i}^{(1)}(1), O_{3,i}^{(1)}(1), O_{3,i}^{(2)}(1), P_i^{(2)}(1)$ can be obtained using direct operations.

Observación 37.10.3 *To determine the second order moments for the queue lengths, it is necessary to calculate the third derivative of the arrival processes for each of the queues.*

CAPÍTULO 38

IMPLEMENTACIONES NUMÉRICAS

38.1. Día 1: Regresión Logística

Implementación Básica en R

Para implementar una regresión logística en R, primero es necesario instalar y cargar los paquetes necesarios.

Instalación y Configuración de R y RStudio

- Descargue e instale R desde `https://cran.r-project.org/`. Siga las instrucciones para su sistema operativo (Windows, MacOS, Linux).
- Descargue e instale RStudio desde `https://rstudio.com/products/rstudio/download/`.

38.1.1. Ejemplo de Regresión Logística en R

A continuación, se muestra un ejemplo de cómo ajustar un modelo de regresión logística en R utilizando un conjunto de datos simulado. El ejemplo incluye la instalación del paquete necesario, la carga de datos, el ajuste del modelo, y la interpretación de los resultados.

```
# Instalación del paquete necesario
install.packages("stats")

# Carga del paquete
library(stats)

# Ejemplo de conjunto de datos
data <- data.frame(
  outcome = c(1, 0, 1, 0, 1, 1, 0, 1, 0, 0),
  predictor = c(2.3, 1.9, 3.1, 2.8, 3.6, 2.4, 2.1, 3.3, 2.2, 1.7)
)

# Ajuste del modelo de regresión logística
model <- glm(outcome ~ predictor, data = data, family = binomial)

# Resumen del modelo
summary(model)
```

En este ejemplo, se utiliza el conjunto de datos *data* que contiene una variable de resultado binaria *outcome* y una variable predictora continua *predictor*. El modelo de regresión logística se ajusta utilizando la función `glm` con la familia binomial. La función `summary(model)` proporciona un resumen del modelo ajustado, incluyendo los coeficientes estimados, sus errores estándar, valores z, y p-valores.

- **Coeficientes**: Los coeficientes estimados β_0 y β_1 indican la dirección y magnitud de la relación entre las variables predictoras y la probabilidad del resultado.
- **Errores Estándar**: Los errores estándar proporcionan una medida de la precisión de los coeficientes estimados.
- **Valores z y p-valores**: Los valores z y p-valores se utilizan para evaluar la significancia estadística de los coeficientes. Un p-valor pequeño (generalmente ¡0.05) indica que el coeficiente es significativamente diferente de cero.

Este es solo un ejemplo básico, en aplicaciones reales, es posible que necesites realizar más análisis y validaciones, como la evaluación de la bondad de ajuste del modelo, el diagnóstico de posibles problemas de multicolinealidad, y la validación cruzada del modelo.

```
# Archivo: regresionlogistica.R

# Instalación del paquete necesario
#install.packages("stats")

# Carga del paquete
library(stats)

# Fijar la semilla para reproducibilidad
set.seed(123)

# Número de observaciones
n <- 100

# Generar las variables independientes X1, X2, ..., X15
# Creamos una matriz de tamaño n x 15 con valores generados aleatoriamente de una
 distribución normal
X <- as.data.frame(matrix(rnorm(n * 15), nrow = n, ncol = 15))
colnames(X) <- paste0("X", 1:15)  # Nombramos las columnas como X1, X2, ..., X15

# Coeficientes verdaderos para las variables independientes

     xlab = "Variables", ylab = "Coeficientes", type = "h", col = "blue")
abline(h = 0, col = "red", lwd = 2)

# Mostrar un mensaje indicando que el proceso ha finalizado
cat("El modelo de regresión logística se ha ajustado, se han hecho predicciones y los resultados se han guardado en 'r
```

38.1.2. Aplicación a Datos de Cáncer - Parte I

A continuación, se muestra un ejemplo de cómo ajustar un modelo de regresión logística en R utilizando el conjunto de datos del cáncer de mama de Wisconsin.

```
# Archivo: regresionlogistica_cancer.R

# Instalación del paquete necesario
install.packages("mlbench")
install.packages("dplyr")

# Carga de los paquetes
library(mlbench)
library(dplyr)

# Cargar el conjunto de datos BreastCancer
data("BreastCancer")

# Ver las primeras filas del conjunto de datos
head(BreastCancer)

# Preprocesamiento de los datos
# Eliminar la columna de identificación y filas con valores faltantes
breast_cancer_clean <- BreastCancer %>%
  select(-Id) %>%
  na.omit()

# Convertir la variable 'Class' a factor binario
breast_cancer_clean$Class <- ifelse(breast_cancer_clean$Class == "malignant", 1, 0)
breast_cancer_clean$Class <- as.factor(breast_cancer_clean$Class)

# Convertir las demás columnas a numéricas
breast_cancer_clean[, 1:9] <- lapply(breast_cancer_clean[, 1:9], as.numeric)

# Dividir el conjunto de datos en entrenamiento (70%) y prueba (30%)
set.seed(123)
train_indices <- sample(1:nrow(breast_cancer_clean), size = 0.7 * nrow(breast_cancer_clean))
train_set <- breast_cancer_clean[train_indices, ]
test_set <- breast_cancer_clean[-train_indices, ]

# Ajuste del modelo de regresión logística en el conjunto de entrenamiento
```

```
model <- glm(Class ~ ., data = train_set, family = binomial)

# Resumen del modelo
summary(model)

# Guardar el modelo y los resultados en un archivo
save(model, file = "regresion_logistica_cancer_modelo.RData")

# Guardar los datos simulados en archivos CSV
write.csv(train_set, "datos_entrenamiento_cancer.csv", row.names = FALSE)
write.csv(test_set, "datos_prueba_cancer.csv", row.names = FALSE)

# Hacer predicciones en el conjunto de prueba
test_set$prob_pred <- predict(model, newdata = test_set, type = "response")
test_set$Class_pred <- ifelse(test_set$prob_pred > 0.5, 1, 0)

# Calcular la precisión de las predicciones
accuracy <- mean(test_set$Class_pred == test_set$Class)
cat("La precisión del modelo en el conjunto de prueba es:", accuracy, "\n")

# Guardar las predicciones en un archivo CSV
write.csv(test_set, "predicciones_cancer.csv", row.names = FALSE)

# Graficar los coeficientes estimados
plot(coef(model), main = "Coeficientes Estimados del Modelo de Regresión Logística",
     xlab = "Variables", ylab = "Coeficientes", type = "h", col = "blue")
abline(h = 0, col = "red", lwd = 2)

# Mostrar un mensaje indicando que el proceso ha finalizado
cat("El modelo de regresión logística se ha ajustado, se han hecho predicciones y los resultados se han guardado en 'r
```

Descripción del Código

Instalación y Carga de Paquetes:

Instalamos y cargamos el paquete `stats` necesario para la regresión logística.

Generación de Datos Simulados:

- Fijamos una semilla para la reproducibilidad.
- Generamos un conjunto de datos con 100 observaciones y 15 variables independientes (`X1, X2, ..., X15`) usando una distribución normal.
- Definimos los coeficientes verdaderos para las variables independientes y calculamos el término lineal.
- Calculamos las probabilidades usando la función logística y generamos una variable dependiente binaria `Y` basada en esas probabilidades.
- Combinamos las variables independientes y la variable dependiente en un `data frame`.

División de Datos en Conjuntos de Entrenamiento y Prueba:

- Dividimos los datos en un conjunto de entrenamiento (70 %) y un conjunto de prueba (30 %).

Ajuste del Modelo de Regresión Logística:

- Ajustamos un modelo de regresión logística en el conjunto de entrenamiento.
- Mostramos un resumen del modelo ajustado.

Guardado de Datos y Modelo:

- Guardamos el modelo ajustado en un archivo `.RData`.
- Guardamos los conjuntos de datos de entrenamiento y prueba en archivos CSV.

Predicciones y Evaluación del Modelo:

- Hacemos predicciones en el conjunto de prueba utilizando el modelo ajustado.
- Calculamos la precisión de las predicciones comparando con los valores reales de `Y`.
- Guardamos las predicciones y las probabilidades predichas en un archivo CSV.

Visualización de los Coeficientes del Modelo:

- Graficamos los coeficientes estimados del modelo ajustado.
- Mostramos un mensaje indicando que el proceso ha finalizado.

Para ejecutar este script, guarda el código en un archivo llamado *regresionlogistica.R*, abre R o RStudio, navega hasta el directorio donde guardaste el archivo y ejecuta el script usando *source(regresionlogistica.R")*.

Ejemplo Titanic

Cuando realizas una regresión logística, obtienes coeficientes para cada variable independiente en tu modelo. Estos coeficientes indican la dirección y la magnitud de la relación entre cada variable independiente y la variable dependiente (en este caso, *Survived*).

Interpretación de los Coeficientes

- **Intercepto** (*(Intercept)*): Este coeficiente representa el logaritmo de las probabilidades (log-odds) de que *Survived* sea 1 (supervivencia) cuando todas las variables independientes son cero.
- **Pclass**: El coeficiente asociado con *Pclass* indica cómo cambia el log-odds de supervivencia con cada incremento en la clase del pasajero. Si el coeficiente es negativo, sugiere que una clase más alta (por ejemplo, de primera clase a tercera clase) reduce las probabilidades de supervivencia.
- **Sex**: Este coeficiente muestra el efecto de ser hombre o mujer en las probabilidades de supervivencia. Generalmente, se espera que el coeficiente sea positivo para *female* indicando que las mujeres tenían mayores probabilidades de sobrevivir.
- **Age**: El coeficiente de *Age* indica cómo cambia el log-odds de supervivencia con cada año de incremento en la edad. Un coeficiente negativo sugiere que la probabilidad de supervivencia disminuye con la edad.
- **SibSp** y **Parch**: Estos coeficientes indican el efecto del número de hermanos/cónyuges a bordo y padres/hijos a bordo en las probabilidades de supervivencia.
- **Fare**: Este coeficiente indica el efecto del precio del billete en las probabilidades de supervivencia. Un coeficiente positivo sugiere que pagar más por el billete se asocia con mayores probabilidades de supervivencia.

Estadísticas de Ajuste del Modelo

El resumen del modelo (*summary(model)*) incluye varias estadísticas importantes:

- **Estadísticos z y p-valores**: Estas estadísticas indican la significancia de cada coeficiente. Un p-valor bajo (generalmente ¡0.05) sugiere que la variable es un predictor significativo de la variable dependiente.
- **Desviación Residual**: La desviación residual mide la calidad del ajuste del modelo. Valores más bajos indican un mejor ajuste.
- **AIC (Akaike Information Criterion)**: El AIC es una medida de la calidad del modelo que toma en cuenta tanto la bondad del ajuste como la complejidad del modelo. Modelos con AIC más bajo son preferidos.

Precisión del Modelo

La precisión del modelo en el conjunto de prueba es una métrica importante para evaluar el rendimiento del modelo. La precisión se calcula como el número de predicciones correctas dividido por el número total de predicciones.

Ejemplo de Resultados

Supongamos que la precisión del modelo es 0.78 (78 %). Esto significa que el modelo correctamente predijo el estado de supervivencia del 78 % de los pasajeros en el conjunto de prueba.

Matriz de Confusión y Otras Métricas

Además de la precisión, otras métricas como la matriz de confusión, la sensibilidad, la especificidad, y el área bajo la curva ROC (AUC-ROC) también pueden proporcionar una visión más completa del rendimiento del modelo.

Matriz de Confusión

- **Verdaderos Positivos (TP)**: Número de pasajeros que sobrevivieron y fueron predichos como sobrevivientes.
- **Verdaderos Negativos (TN)**: Número de pasajeros que no sobrevivieron y fueron predichos como no sobrevivientes.
- **Falsos Positivos (FP)**: Número de pasajeros que no sobrevivieron pero fueron predichos como sobrevivientes.
- **Falsos Negativos (FN)**: Número de pasajeros que sobrevivieron pero fueron predichos como no sobrevivientes.

Ejemplo de Cálculo de Métricas

```
# Calcular la matriz de confusión
table(test_set$Survived, test_set$Survived_pred)

# Calcular sensibilidad y especificidad
sensitivity <- sum(test_set$Survived == 1 & test_set$Survived_pred == 1) / sum(test_set$Survived == 1)
specificity <- sum(test_set$Survived == 0 & test_set$Survived_pred == 0) / sum(test_set$Survived == 0)

# Calcular AUC-ROC
library(pROC)
roc_curve <- roc(test_set$Survived, test_set$prob_pred)
auc(roc_curve)
```

Visualización de Resultados

Graficar los coeficientes del modelo, la curva ROC y otras visualizaciones ayudan a entender mejor el rendimiento y la importancia de cada variable en el modelo.

```
# Graficar la curva ROC
plot(roc_curve, main = "Curva ROC para el Modelo de Regresión Logística")
```

Resumen Final

El modelo de regresión logística aplicado al conjunto de datos del Titanic proporciona una forma de entender cómo diferentes características de los pasajeros influyen en sus probabilidades de supervivencia. La interpretación de los coeficientes del modelo, las estadísticas de ajuste, y la precisión del modelo en el conjunto de prueba son fundamentales para evaluar el rendimiento y la utilidad del modelo en hacer predicciones sobre la supervivencia de los pasajeros del Titanic.

38.1.3. Simulación de Datos de Cáncer - Parte II

Aquí se presenta un ejemplo de cómo realizar una regresión logística utilizando datos simulados de pacientes con cáncer.

```
#---- Archivo: cancerLogRegSimulado.R ----

# Instalación del paquete necesario
if (!requireNamespace("dplyr", quietly = TRUE)) {
  install.packages("dplyr")
}

# Carga del paquete
library(dplyr)

# Fijar la semilla para reproducibilidad
set.seed(123)

# Número de observaciones
n <- 150

# Generar las variables independientes X1, X2, ..., X15
# Creamos una matriz de tamaño n x 15 con valores generados aleatoriamente de una
distribución normal
X <- as.data.frame(matrix(rnorm(n * 15), nrow = n, ncol = 15))
```

```
colnames(X) <- paste0("X", 1:15)  # Nombramos las columnas como X1, X2, ..., X15

# Coeficientes verdaderos para las variables independientes
# Generamos un vector de 16 coeficientes (incluyendo el intercepto) aleatorios entre -1 y 1
beta <- runif(16, -1, 1)  # 15 coeficientes más el intercepto

# Generar el término lineal
# Calculamos el término lineal utilizando los coeficientes y las variables independientes
linear_term <- beta[1] + as.matrix(X) %*% beta[-1]

# Generar la probabilidad utilizando la función logística
# Calculamos las probabilidades utilizando la función logística
p <- 1 / (1 + exp(-linear_term))

# Generar la variable dependiente binaria Y
# Generamos valores binarios (0 o 1) utilizando las probabilidades calculadas
Y <- rbinom(n, 1, p)

# Combinar las variables independientes y la variable dependiente en un data frame
data <- cbind(Y, X)

# Dividir el conjunto de datos en entrenamiento y prueba
set.seed(123)  # Fijar la semilla para reproducibilidad
train_indices <- sample(1:n, size = 0.7 * n)  # 70% de los datos para entrenamiento
train_set <- data[train_indices, ]  # Conjunto de entrenamiento
test_set <- data[-train_indices, ]  # Conjunto de prueba

# Ajuste del modelo de regresión logística en el conjunto de entrenamiento
# Ajustamos un modelo de regresión logística utilizando las variables independientes
para predecir Y
model <- glm(Y ~ ., data = train_set, family = binomial)

# Resumen del modelo
# Mostramos un resumen del modelo ajustado
summary(model)

# Guardar el modelo y los resultados en un archivo
# Guardamos el modelo ajustado en un archivo .RData
save(model, file = "regresion_logistica_cancer_modelo_simulado.RData")

# Guardar los datos simulados en archivos CSV
# Guardamos los conjuntos de datos de entrenamiento y prueba en archivos CSV
write.csv(train_set, "datos_entrenamiento_cancer_simulado.csv", row.names = FALSE)
write.csv(test_set, "datos_prueba_cancer_simulado.csv", row.names = FALSE)

# Hacer predicciones en el conjunto de prueba
# Utilizamos el modelo ajustado para hacer predicciones en el conjunto de prueba
test_set$prob_pred <- predict(model, newdata = test_set, type = "response")
test_set$Y_pred <- ifelse(test_set$prob_pred > 0.5, 1, 0)
# Convertimos probabilidades a clases binarias

# Calcular la precisión de las predicciones
# Calculamos la precisión de las predicciones comparando con los valores reales de Y
accuracy <- mean(test_set$Y_pred == test_set$Y)
cat("La precisión del modelo en el conjunto de prueba es:", accuracy, "\n")

# Guardar las predicciones en un archivo CSV
# Guardamos las predicciones y las probabilidades predichas en un archivo CSV
write.csv(test_set, "predicciones_cancer_simulado.csv", row.names = FALSE)

# Graficar los coeficientes estimados
# Graficamos los coeficientes estimados del modelo ajustado
plot(coef(model), main = "Coeficientes Estimados del Modelo de Regresión Logística",
     xlab = "Variables", ylab = "Coeficientes", type = "h", col = "blue")
abline(h = 0, col = "red", lwd = 2)

# Mostrar un mensaje indicando que el proceso ha finalizado
cat("El modelo de regresión logística se ha ajustado, se han hecho predicciones
y los resultados se han guardado en 'regresion_logistica_cancer_modelo_simulado.RData'.\n")
```

38.1.4. Simulación de Datos de Cáncer - Parte III

En un estudio sobre cáncer, especialmente en el contexto del cáncer de mama, las principales mediciones suelen incluir una variedad de características clínicas y patológicas. Aquí hay algunas de las principales mediciones que se tienen en cuenta:

- **Tamaño del Tumor**: Medición del diámetro del tumor.
- **Estado de los Ganglios Linfáticos**: Número de ganglios linfáticos afectados.
- **Grado del Tumor**: Clasificación del tumor basada en la apariencia de las células cancerosas.
- **Receptores Hormonales**: Estado de los receptores de estrógeno y progesterona.
- **Estado HER2**: Expresión del receptor 2 del factor de crecimiento epidérmico humano.
- **Ki-67**: Índice de proliferación celular.
- **Edad del Paciente**: Edad en el momento del diagnóstico.
- **Histopatología**: Tipo y subtipo histológico del cáncer.
- **Márgenes Quirúrgicos**: Estado de los márgenes después de la cirugía (si están libres de cáncer o no).
- **Invasión Linfovascular**: Presencia de células cancerosas en los vasos linfáticos o sanguíneos.
- **Tratamientos Previos**: Tipos de tratamientos recibidos antes del diagnóstico (quimioterapia, radioterapia, etc.).
- **Tipo de Cirugía**: Tipo de procedimiento quirúrgico realizado (mastectomía, lumpectomía, etc.).
- **Metástasis**: Presencia de metástasis y ubicación de las mismas.
- **Índice de Masa Corporal (IMC)**: Relación entre el peso y la altura del paciente.
- **Marcadores Genéticos**: Presencia de mutaciones genéticas específicas (BRCA1, BRCA2, etc.).

Estas mediciones proporcionan una visión integral del estado del cáncer y se utilizan para planificar el tratamiento y predecir el pronóstico.

A continuación, se muestra un ejemplo de cómo ajustar un modelo de regresión logística en R utilizando un conjunto de datos simulado con estas mediciones.
